Cheese prices on the Wisconsin Boards opened at 23 cents, declined a half cent, and closed the month at the opening price. The March average was 22.7 cents, a decline of 1.5 cents from February and 2 cents above March a year ago. The first two weeks of April registered a decline to 22 cents, which is about a half cent above the same period a year ago.

Cheese production for the first two months of the year totaled 45,012,000 pounds, or nearly six million pounds less than last year. Imports were 2½ million pounds greater and storage four million pounds less. The trade output was 72,811,000 pounds, a decrease of nearly five per cent from last year.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market during March:

	Mar. 1927	Feb. 1927	Mar. 1926
	Cts.	Cts.	Cts.
Twins	22.2	24.1	23.0
Single Daisies	22.7	24.2	23.0
Longhorns	22.6	24.8	23.2
Square Prints	22.7	24.6	23.8
*Receipts since Jan. 1	40,374	26,204	41,686
*Storage end of month	10,629	12,027	16,880
*Receipts for month	14,170	14,214	13,749

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—000 omitted).

Milwaukee March Milk

The Milwaukee Co-operative Milk Producers announce the following prices for the month of March:

For the portion sold as fluid milk, $2.90 per cwt.; and for the portion manufactured, $2.11 per cwt. These prices apply to 3.5 per cent milk delivered f. o. b. city, four cents being added or subtracted for each one-tenth of one per cent variation in test. Seventy per cent of the total receipts were sold as fluid.

Philadelphia April Milk

The Inter-state Milk Producers' Association announces that the April basic price for milk will be $3.29 f. o. b. Philadelphia and $2.71 per hundred at receiving stations in 51—60 mile zone.

The March surplus prices were $2.53 first surplus and $2.14 second surplus f. o. b. Philadelphia. The March surplus prices at all receiving stations on railroad were $1.96 first surplus and $1.56 second surplus.

These prices are based on milk testing 3 per cent butterfat with a differential of 2 cents for each half point of test up and down.

March Butter

Butter prices in March opened at 50 cents, dropped to 46 cents, and raised again to 53.5 cents. The average for the month was 50.2 cents, a decline of 1.3 cents from the February average and an advance of 7.4 cents above March a year ago. Price changes have been largely due to uncertainties as to future supplies, the present situation being an acute present shortage of domestic supplies and prospective competition of foreign imports. There is now a narrow margin of only one cent between high grade and undergrade butter, which verifies the existence of a real butter shortage. Foreign markets and increasing production as the pasture season opens will doubtless be the controlling factors in price during the next three months.

For the first two weeks of April prices continued their erratic course. As this is written markets are firm at advanced prices and receipts are still below normal. Buyers were unable to secure their full quotas and slight premiums were secured by sellers. Reports as to impending imports continue to have a bearish influence in holding down prices.

Creamery butter production for the first two months of the year was 187,488,000 pounds, an increase of two million pounds from that of a year ago. Net imports were nearly a million pounds less, and storage supplies were 18 million pounds less. The reported trade output was 281,918,000 pounds, a decrease of one per cent from a year ago.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices on 92-score butter (extras) at four of the principal markets, together with receipts and storages:

	Mar. 1927	Feb. 1927	Mar. 1926
	Cts.	Cts.	Cts.
Chicago	49.4	50.4	41.5
New York	50.2	51.5	42.8
Boston	51.0	51.9	43.3
Philadelphia	51.1	52.1	43.1
*Receipts for month	44,108	37,538	43,968
*Receipts since Jan. 1	118,333	74,225	123,471
*Storage end of month	1,363	4,222	9,305

*In thousands of pounds at the four markets (i. e.—000 omitted).

Ninety-score butter averaged 48.4 cents for March in Chicago, with centralized butter at this market selling for 49.2 cents. Jobbers' prices on extras sold to retailers averaged 51.9 cents in Chicago, a spread of 2.5 above wholesale.

Feed Market Situation

(By Grain, Hay and Feed Market News Service, U. S. Department of Agriculture.)

Feed prices have generally followed a downward trend during the last few days of March and the first part of April, although wheat feeds have recently turned firm because of a more active demand for the limited offerings. The earlier pasturage has tended to restrict the demand for feeds but the output continues only moderate and offerings of linseed meal and of bran have been hardly equal to current needs.

Wheat feed prices have advanced largely because of Northeastern demand for bran. Both Kansas City and Minneapolis mills at the present writing (April 9) are on a shipping basis to Philadelphia and New England and eastern inquiry has absorbed the surplus although only scattered local inquiries were reported in the Northwest and the Southwest. Less Canadian bran has been imported by the Northeast this year, largely because of reduced Canadian millings and possibly also the relative shortage of hay in Eastern Canada. Mills at Buffalo are reported as around two weeks behind on feed shipments. Bran was relatively stronger than the heavier feeds.

More wheat has been ground into flour to date this season than last but a smaller percentage of the wheat has gone into offal this year. Only 17.1 pounds of offal per bushel of wheat were secured in February, 1927, compared with 18.1 for February, 1926, according to reports to the Department of Commerce covering around 90 per cent of the flour produced.

Linseed meal prices advanced sharply, but this was due more to restricted production of meal than to an increase in consuming demand. Crushers generally complained of a slow demand for linseed oil, although a rather optimistic outlook prevailed in the paint and varnish industries after some recession early in March. With production light at Buffalo, some improvement in export demand took part of the surplus meal, so that prices worked higher. At Minneapolis the local output fell short of current needs and some meal was brought in from points outside the city.

The Netherlands took about 17,000 tons and Belgium about 8,000 tons out of a total of around 27,000 tons of linseed cake and meal exported by the United States during February. The United Kingdom and Germany took smaller amounts.

Cottonseed Meal Easier

Offerings of this feed increased and prices have shown a downward tendency from the peak reached last winter. Some northern jobbers were still anxious to work off the stocks of meal which they had purchased earlier in the season, although a number appeared to have moved the bulk of their holdings and were not pressing sales. Southern crushers and dealers, however, were more anxious to make sales. In at least one territory in the Southeast farmers took considerable amounts of meal in exchange for seed when seed meal were cheap and are now willing to some meal or exchange it for fertilizer. ports from the southern states indicate less fertilizer is being purchased this sp than a year ago. This may also effect amount of cottonseed meal taken by fert companies.

Gluten Feed Sharply Lower

Demand for gluten feed at previous q tions had been slow for some time and in April prices of this feed were red about $3.15 a ton to the usual grass quoted in summer months. Some deale the Northeast state that demand is activ the reduction and urge their customer telegraph their orders at once. Based o cousumption of corn by corn starch man turers the output of this feed was of mod quantity during March.

Hominy feed which sagged off during middle of March in sympathy with the de in the corn market has recently turned s what firmer, particularly in the North Buffalo mills were becoming well sold u hominy feed but offerings at Philade seemed adequate. Prices in central we markets averaged slightly lower than weeks ago.

Prices of tankage at the principal ma were reduced $5 a ton early in April and feed is now quoted at $70 a ton in carlo the principal markets in the Central Wes

	Bos-ton	Buf-falo	Phil-adel-phia	Chi-cago	Min-neap-olis
Bran*	35.50	30.50	34.25	29.00	26.00
43% C.S. meal	41.50	38.50	39.50	36.00	
34% L. S. meal		47.00			49.00
Gluten feed	36.75	33.50	35.70	29.60	
Hominy	32.75	29.50	31.00	27.00	

*Standard spring bran. Hard winter w bran was $25.50 in Omaho and $25.25 in sas City, with soft winter wheat bran $ in St. Louis and $31.25 in Cincinnati.

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold st holdings of dairy products on April 1, fi being given in thousands of pounds omitted):

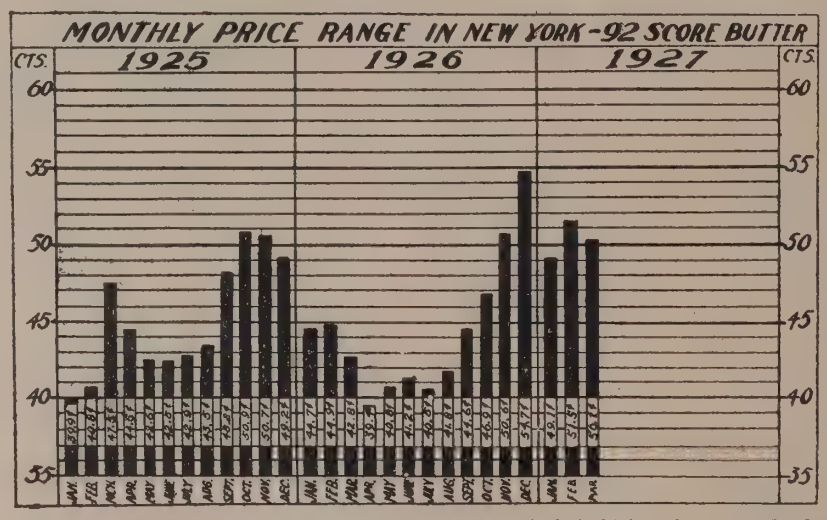
	Apr. 1 5-yr. av.	Apr. 1 1926	A
	Lbs.	Lbs.	
Butter, Creamery	10,009	17,392	
Cheese:			
American	23,852	38,041	3
Swiss	5,236	6,846	
Brick	975	1,458	
Limburger	655	1,029	
All other	4,348	3,911	

These holdings include stocks in both storage warehouses and packing house p

Connecticut April Mill

The Connecticut Milk Producers' Associ announces the following prices for Gra milk delivered during April at market centers:

All milk sold in fluid form, 9.5 cents quart for 4 per cent milk, and 4 cents point allowed for other tests; all milk into cream that is sold in fluid form, cents per pound fat above the average m ly price of 92-score butter on the Boston ket; all milk made into butter, at a pric pound fat equal to the month's averag 92-score butter in Boston.



Sheffield March Milk

The cash price for March, 1927, paid field producers for three per cent Gra milk in the 201—210-mile zone is $2.4 hundred pounds with the usual freight butterfat differentials. This is equivale $2.69 for 3.5 milk.—C. W. Halliday, Sec.

Another 40-lb. Holstein Record

The most recent 40-lb. 7-day re to be announced by the Holstein-F sian Ass'n. of America is tha Burke Fryslan Waldorf, a 5-yea cow bred and owned by Iow Farms of Iowa. She produced lbs. of milk containing 32.35 lbs. terfat (40.44 lbs. butter) in 7 and is the first cow to make su record on three milkings per da

Uncle Ab says some of the memories he knows are owned people who remember to forget who forget to remember.

The March average price of butter was 50.2 cents, which is higher than any March on record except for 1919 and 1920 when prices were 62 and 67 cents, respectively.

CALF MARKING SCHEME

N. P. NEAL, NEW ZEALAND

WITH trepidation the writer commends to the attention of Wisconsin dairymen a me which has recently been put ractice in New Zealand and which i to renew the life of its dairy stry, to invigorate it with the ion which it in part lacked and yet led, as is the case in many parts f Wisconsin. The scheme—famil- r known as the "calf marking" me—is a bold one, but one which ertain to succeed considering that ing it are the essentials for suc- e.

its operation the scheme is very ple. It merely consists in tattoo- in the ear the heifer calves from producing dams and registering a with the "heifer calf associa- " which is under the complete rol of the Dominion Group Herd ing Federation. In the Register entered the following particulars: e and address of breeder, calf o number, date of birth, the ber of dam on test sheets, ap- imate age at commencement of e, predominating breed, butterfat duction, number of days in milk, e on; the name, herd book number, breed of sire.

he fact that the scheme is con- ed by the Dominion Herd Group eration will have the effect of ing the scheme uniform through- New Zealand, as under the rules of the association only affiliated herd testing associations will have the right of marking calves. Application for numbers will be made each year to the federation by affiliated associations, thereby eliminating the danger of any registered calves in different districts bearing the same tattoo numbers.

The letter T is the registered mark of the federation. Commencing in 1925-26 season, each season is lettered A, B, C, etc., and each calf is given a serial number. Thus, calves born in 1925-26 season were tattooed T. A.; in the present season the index letters will be T. B.; the 1927-28 season's crop will be indexed T. C., and so on. The marking is done on the right ear.

Only heifer calves from dams that have been tested by an affiliated test association will be eligible for registration, provided:

1. The dams have produced in one lactation period of not more than 305 days, the following minimum amounts of butterfat, according to the age at commencement of test:—As a 2-year-old, 250 lbs. fat; as a 3-year-old, 275 lbs. fat; as a 4-year-old or older animal, 300 lbs. fat. 2. That the calves are by a registered pedigree bull. A certificate is issued by the secretary of the affiliated association under whose jurisdiction the marking has been carried out.

The scheme has immense possibilities. Marked stock carries a guarantee of two of the most essential qualities in a dairy cow, viz., breeding and butterfat backing.

It will undoubtedly discourage the present disastrous system of raising "scrub" calves—the vast majority of which, because they lack breeding and butterfat backing, never can be payable dairy cows. Owners of "scrub" calves will soon have no sale for them and so only the calves with good backing will be reared for the future requirements of the industry. Dairy farmers in New Zealand were quick to appreciate the possibilities of the scheme. Although the scheme is now entering only its second season, there has been a very decided slump in values of unmarked calves, whereas those owners who possessed the vision to go in for testing and marking have had an extraordinary demand for their marked stock and have been rewarded with high prices. The cost is negligible. In New Zealand the season fee is 25 cents for each calf marked.

Marked calf fairs are sponsored by the federation and those already held have proven a remarkable demonstration of the great advantage of the scheme. Auctioneering firms and financial institutions, too, are "behind" it. The calf marking scheme is one more proof, if this were needed, of what can be achieved by co-operation, co-operation not only of one section of the industry but of all those who are in any way connected with it.

Gunnite Silos in Austria

OARD'S DAIRYMAN:—I am very h interested to read in Hoard's yman of concrete silos construct-

G. 2—GUNNITE SILO ON A FARM N THE AUSTRIAN MOUNTAINS

n the Brant Rancho, California, ned to be the first made of gun- it I dare say they are not the first.

G. 1—APPLYING CONCRETE TO THE SKELETON WITH THE "GUN"

In September, 1924, I built a gunnite silo on my farm in Austria and several others on other places since.

To avoid the heavy steel framework, which is rather expensive and not easy to construct, I used a wooden skeleton which acts as a form, as reinforcement, and as a very effective support to the concrete jet. Fig. 1 shows the applying of concrete to the skeleton with the "gun." Fig 3 is the first gunnite silo. The wall is 2½ inches thick and consists of about two-thirds of wood and one-third of concrete. The silos erected with this method are permanent buildings and have proven absolutely water and air-tight. Moreover, the imbedded wooden skeleton has a remarkably good insulating effect. The method of using the wooden skeleton (mainly consisting of three layers of wooden laths) for concrete walls is patented in several European States and applied for patent in U. S. A.

The American readers will be astonished and, I am sure, they will laugh over the small size of the first silo constructed in 1924. But in this time we had no cutters and we had to fill the silo from a bridge (to be seen in Fig. 3 behind the silo.) Since we have the wonderful American cutters, we can construct and fill silos of more than 30 ft. as the one shown in Fig. 2 situated on a farm in the Austrian mountains. The little shed at the base has to house the filling machinery.

In the rough climate of the mountains the crop of silage corn is not satisfactory, but we have better results with sunflower and the best with Jerusalem artichoke and with another plant of the same family, *Helianthus Macrophyllus*. The silage of both the latter mentioned plants is quite as good as a good corn silage.

FIG. 3—THE FIRST GUNNITE SILO

Perhaps it would interest your readers to see that European farmers have begun to use the more effective American farming methods.

Austria. HANS KUPELWIESER.

An Ohio Guernsey Record

E. C. Peck of Ohio is proudly showing one of his good Guernsey cows as the new state champion for her age class. May Rose Daisy of Avalon has recently completed a year's record of 17,717.6 pounds milk and 840.8 pounds fat as a mature cow. During the year's test, she was in calf for 265 days. When she was a senior two-year-old she made a record of 12,179.1 pounds milk and 609.1 pounds fat, so her present record did not come as a surprise. She now takes sixth place for the entire breed in Class AA, and first place in the state of Ohio for the same class.—The American Guernsey Cattle Club.

Every meal made *a bit tastier*

WHEN it comes to meals — and three times a day it's mealtime — salt is next to indispensable. In the kitchen, it becomes a part of almost every dish; at the table, how often you hear, "please pass the salt."

Naturally, as a good cook and housewife, you know that salt is important in food, but if you only knew how much pure, mild flake salt adds to the tastiness of the meals you serve you would use no other than Diamond Crystal.

Diamond Crystal flakes, quick to dissolve, blend readily with the food, and make it more delightful and enjoyable by bringing out the true food flavors. This salt is refined by special process, which frees it of impurities, and makes it mild-flavored. Try Diamond Crystal for cooking and for the table—you'll see the difference it makes in the taste.

There is a Diamond Crystal Salt for every farm use—for table and for cooking, for butter and cheese-making, for livestock, for curing meats, for canning. Ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

Diamond Crystal Salt

Free!

We should like to send you a generous sample of Diamond Crystal Shaker Salt and the interesting booklet, "101 Uses for Diamond Crystal Salt," without cost or obligation to you.

Are You Buying a New Wardrobe?

I wonder what it is about the first warm days of spring that make a woman begin to think about new clothes. I suppose it is the same thing that makes her want to hang the bedding on the line, lay the mattresses out in the sun, take up the rugs or carpets, wash the windows, and make things in general uncomfortable for the man of the house with her spring cleaning. We see the trees putting on new dresses and an instinct as old as Nature herself stirs and makes us want to do the same for ourselves and our houses. I can think of no other reason for this craving.

An extra early spell of fine balmy weather came along a few weeks ago up where I live. I stood it for a few days but all the while something kept nagging at me to go shopping—buy new clothes—trick myself out. I wanted a thousand things I knew I could never buy, so why bother clerks and take their time showing things they could never sell me! Thus I disposed of the tempter until he appeared in a new form, suggesting that the women who read our home department would be interested in hearing what the stores say will be worn this spring and summer. I needed only the smallest excuse and armed with this one, I started out to the stores and shops that are dearest to a woman's heart this time of year and I talked to buyers who have been away to the big city markets. Here is a sort of digest of what they said about "what they will wear."

Sports styles have become the general favorite to such an extent that the term "sports dress" has come to mean general wear dress which includes practically everything except real evening clothes. This style is becoming to almost every age and type of figure and women wear the so-called sports dresses who never have and never will take part in any sort of sports but they like it for its comfort, good lines, and freedom from fussiness.

Suits are to be worn more than ever this spring and they are all of the trim sort that make most any figure look very neat and attractive. The skirts are short with two or more pleats that give a comfortable width for walking. The coats are of the straight box type, for the most part, either single- or double-breasted, sometimes bound all the way around with braid to match the material. As to color they seem to be either very light tans or grays or else dark blue or black. I don't believe I saw a single in-between color.

If you are going to wear a suit, it is important to have the right things to go with it. Suit blouses this year are very plain, some cut exactly like a man's vest with points and buttons in the front and a little strap across the back; others are cut straight across the bottom. Most people do not take off their coats even when they wear their suits to an informal party and for that reason many of the blouses have not a ghost of a sleeve. Others, if the material is thin, have long sleeves and tailored cuffs. Some wear no blouse at all under a suit coat—only a sort of false-front vest—but I have always thought this a shabby and unclean habit.

Hats are again nearly all of the small, close-fitting variety though you will see the annual attempt to have women take to the larger sizes. The comfort of the small hat has been so great, however, that it is going to take time to dislodge it. If you get a tan hat, it is nice to have a tan purse to match and a tan handkerchief—mostly for show, you know—sticking out of your pocket. A green purse with a green hat makes a nice combination, too. And speaking of hats, they are made of silks or satins, felts, or straws though the latter are of such a glorified variety that you would hardly recognize them as such. They are so fine and soft that they can be rolled into a small bundle, if necessary, for packing. There are just enough of the stiffer variety to make one feel comfortable if she happens to prefer that sort.

Shoes, it seems to me, are a trifle less fancily cut than they were a season ago but they make up for it by the way they use combinations of different colored leathers, the snake skin variety, especially, and by the height of heel on the fancy dress shoes. How anyone can walk in them is more than I can see but, of course, the correctly dressed woman does not wear such things except at formal affairs. Stockings are still of the sheer silk variety with the lightweight woolens and lovely lisles for more practical wear, which doesn't mean, however, that they are a bit less expensive.

It seemed last year that we were due for a change from the light colored hose we have had so long but they appear to be still the main standby though some well-dressed women are wearing the blacks and gun metals.

Materials for the spring dresses are the silks, satins, and thin wools. One buyer told me that black satin dresses had about run their course and that he was not stocking any of them; another said that they were still the most popular thing and that he was buying more than ever of them, so there you are. Figured materials seem to be very popular and for summer wear it appears that cotton will be in better style than silk which we have had so constantly the year around for so long. There will be lovely checked and plaid ginghams, and figured voiles and crepes all made with good plain lines but many of them with a flying scarf, jabot, or skirt ripple to give a softened appearance for in spite of the fact that the smartest clothes are of the plain sports type, there is more and more of a tendency toward soft femininity about them. Even hair, though the bob is going nearly as strong as ever, seems to be getting less mannish and the newer cuts are less and less of the boyish bob variety and more and more of the sort that permit a little softness around the face.

Coats for spring and summer are like all the other things—plain sports models, some with fur collars and some without; many of them with severely tailored collars that are meant to be partly concealed under a bright scarf.

No talk of styles would be complete without a mention of the flower that is so universally worn on the left shoulder. These seem to be in just as good style as ever and are pretty if bought to match the gloves. Some of these flowers are very expensive but I'll tell you on the side that I saw some perfectly lovely ones at the ten cent store. Gloves are still of the slip-on variety but I was told that the kind that button or clasp are expected to be worn later on.

I've left out all mention of underwear but we'll have to do that some other time. I hope that you have got some useful information out of this and I feel that I owe you a great deal of thanks for giving me an excuse to go around and see all the lovely things on and even try some on.—LUCY THOMPSON.

BATH ROOM IN FARM HOME OF O. C. LOWER, INDIANA

Easter

Do your children ever ask you, "Mother, why does Easter come in April this year when it was in March last year," and if they do, have you any idea how to answer them? If you have, you know more than most people for the fixing of the date for Easter is a very intricate thing and for many years a determined effort has been made to have one definite date set just as we do for Christmas so that we'll always know when it is. The main trouble about doing that, it seems, is that it would make Easter come on Sunday only once in seven

Miscellaneous Fashions

No. 3018—Simple and Smart. Cuts in s 38, 40, 42, 44, 46, and 48 inches bust meas The 44-inch size requires 3⅝ yards of 40- material with 1⅝ yards of 18-inch contrast

No. 3019—Harmonizing Tones. Cuts sizes 16, 18 years, 36, 38, 40, and 42 in bust measure. The 36-inch size requires yards of 40-inch material for blouse and s band, with 3⅛ yards of 40-inch material skirt and camisole. Emb. No. 730 (blu yellow) costs 15c extra.

No. 2955—Good Taste. Cuts in sizes 14 and 18 years, 36, 38, and 40 inches bust m ure. The 36-inch size requires 3 yards of inch material with ¾ yard of 36-inch trasting and ⅝ yard of binding.

No. 2953—Morning Dress. Cuts in size years, 36, 38, 40, 42, 44, and 46 inches measure. The 36-inch size requires 3½ y of 40-inch material with ¼ yard of 6- material for vestee.

No. 2707—Youthful Model. Cuts in s 16, 18 years, 36, 38, 40, and 42 inches measure. The 36-inch size requires 2⅞ y of 36-inch material with ⅝ yard of 36- contrasting.

No. 3010—Delightfully Girlish. Cuts in es 6, 8, 10, 12, and 14 years. The 8-year requires 1⅞ yards of 32- or 36-inch mat with ¾ yard of 36-inch contrasting.

No. 2766—Boy's Union Suit. Cuts in 2, 4, 6, 8, 10, and 12 years. The 8-year requires 1¼ yards of 36-inch material.

How to Order Patterns

Enclose 10c in stamps or coins (wrap carefully) for each pattern ordered. your order to Fashion Department, Hoa Dairyman, Fort Atkinson, Wis. Every tern is seam-allowing and guaranteed t perfectly. Do not fail to state size.

Our patterns are made especially for u the leading fashion designers of New City. No stock of patterns is carried in office and, since all orders are forwarde the factory, kindly allow a reasonable for delivery of any pattern you order.

s though if we do not celebrate stmas on Sunday it seems unnec- y always to have Easter fall on day.

s now arranged in accordance the decree of the Council of , Easter is always the first Sun- after the full moon that falls on ext after the twenty-first of h. If this full moon comes on nday, then Easter is the follow- Sunday. This sounds very simple the trick comes in that expres- "full moon." The time of the moon differs in different parts he earth and therefore its so- d time has to be figured from things as "the dominical letter, , the golden number"—if you what these are—and only a n who has made a study of it lo the figuring accurately. It is, ver, correct, to say that the time aster varies according to the full and that it cannot be earlier March 22 or later than April 25. is variation of Easter is a source eat concern, of course, to mer- ts. In the warm localities they an early Easter and in the cold a late Easter so as to sell more for the "Easter parade." For- ely, this is coming to have less less significance and whereas women would actually stay from church if they did not new clothes, they now go in old winter outfits and enjoy the ce with perfect tranquility.

The Meal That Needs No Elaboration

rest secure in the knowledge you can meet any emergency is of the greatest satisfactions in keeping. To know that the pan- shelves are so stocked with d goods, supplies, seasonings, and flavorings, that an almost instantaneous meal can be conjured, is like taking out insurance for peace of mind.

In what household are there not emergencies? It may happen that on the day you are watching the last chicks hatch in the incubator that Johnny is sent home from school, a little ill, and needs to be doctored and dosed. Then you wish to substitute a quick meal for the regular dinner or supper.

Almost the first thought that comes to mind when considering the hasty meal is something for a main or meat dish. The farm woman is especially fortunate in having on hand most of the time ham, sausage, head cheese, and other semi-prepared meats. To the supply she has on hand of her own farm products she can add any or several of the following canned meats: beef, corned-beef, dried beef, whole tongue, and veal loaf. If her family will eat fish she can add a can of salmon, tuna, crab, lobster, and a box of flaked codfish.

For example, if you were in a rush to get a meal and you knew you had on your pantry shelf a couple of cans of corned beef and had some potatoes already cooked in the pantry, you could soon concoct a dish of corned beef hash and serve it in a baking dish with crisp bacon or with a garnish of poached eggs. If you wanted to serve some of your home cured ham and wanted it just a little different you could, with a can of tomato, soon make a sauce. Seasoned with Worcestershire sauce or a little chopped relish it will have a new flavor.

Tongue could be served with a currant sauce with a thick sauce as a base, made of 2 tablespoons of butter, 2 tablespoons of flour, 1½ cups of water, 1 tablespoon of Worcestershire sauce, and three tablespoons of currant jelly. Lay thin slices of tongue into this sauce and heat it thoroughly. Garnish it with a little parsley if you want to dress it up in company style.

Canned soups of all kinds are better than almost anything else to eke out a meal that is otherwise slim. If a meat or vegetable soup is used it can be diluted with milk or water and served as a soup with crackers, croutons, noodles, dumplings, rice, or macaroni. After a good plate of soup supplemented with one of these more hearty additions, a less heavy meal is required for the remainder.

Soups can be made to go further than the first course. I have known a perfectly good stew that was made from several cans of soup, vegetable and beef, heated together in one pot with the addition of very little water and served with dumplings. Such a stew is really excellent and is well worth trying.

A favorite ragout is made in much the same way. This makes a very complete meal and is made by emptying the contents of a can of spaghetti and tomatoes into a casserole and pouring over it a can of thick meat soup. Over the top crumbs are spread and the dish is set into the oven to heat through thoroughly and brown.

The salad has saved many a day. Other plans may go wrong but the woman who has or cultivates the salad habit can always meet an emergency. The secret of the quick salad is to have at least one kind of dressing always on hand. When the dressing is ready the rest of the salad is easily invented. Canned or left-over meats, chicken, and fish are easily combined with rice, potatoes, olives, celery, and hard-boiled eggs. Apples, which are almost always found in the farm home, especially during the season when the fresh garden greens are scarce, can be combined with bananas, canned pears, peaches, apricots, nuts, cherries, dates, raisins, nuts, or marshmallows. Pineapple may be combined with cheese, tomatoes with cheese, beets with string beans, peas with carrots, or meat with all sorts of vegetables.

Desserts seem to be the easiest of all. But even to make them hurriedly there must be the things in the pantry that will furnish the materials. If the stock of canned fruits is abundant in the cellar, then one needs only to go down stairs and bring up a can of sauce. But when it is nearing exhaustion then one needs to keep on the pantry shelf some of the jelly powders and ready mixed pudding powders. The trouble with the jelly powders is that it always requires some time for them to set, but they take only one minute to prepare and then they are ready to serve. Canned fruit juice thickened with jelly powder makes a delicious dessert, and the same fruit syrups thickened with a little cornstarch will make a sauce that will quickly convert a piece of stale cake or a dish of plain cornstarch pudding into an elaborate looking dessert.

Marshmallow cream, coconut, dates, and nuts help out a good bit in making up a quick dessert. When two or three different kinds of canned fruits are cut into small pieces and put into sherbet glasses and they are topped with a bit of cocoanut, marshmallow cream, or a nice red cherry, an interesting looking dessert is soon prepared.

When there is nothing else to serve for cake or cookies, one can make a thick paste with 1 cup of powdered sugar, 2 tablespoons of water, and 2 teaspoons of vanilla extract. This spread sandwich style between graham crackers makes a dainty cookie or cake substitute.

These are only suggestions. The

Sr rtness and Economy—There isn't any wonder for the popularity of the youthful box- ait skirt, seen in Style No. 3012. It affords many interesting changes of costume, worn th louses of different design or fabric. Pattern in sizes 16, 18 years, 36, 38, 40, 42, 44, d inches bust measure. For example, Design No. 3015 of wool jersey expresses the sports eli , and can be had in sizes 16, 18 years, 36, 38, 40, 42, 44, and 46 inches bust measure. rked individuality is Design No. 3014 of silk crepe for general wear; pattern in sizes years, 36, 38, 40, 42, and 44 inches bust measure. A more frivolous affair of filmy iff or georgette crepe in Design No. 3013 can be had in sizes 16, 18 years, 36, 38, 40, and i es bust measure. The above pattern costs 10c each in stamps or coin (coin preferred). ir atterns are made by the leading Fashion Designers of New York City and are guaran- ed , fit perfectly. Send to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis.

fresh water

Cool and Sparkling at the Turn of Any Faucet

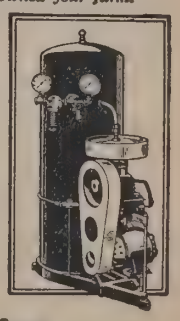
HARD work is here—and hot weather's ahead! Now is the time to decide once and for all against the nuisance and labor of pumping and carrying water by hand. It takes only a few days to install a National Fresh Water System. Then —

Just think of coming in from the fields on a hot day and simply turning a faucet to get water — *fresh water*, cool and sparkling pumped right from the well when the faucet is opened. Think of having plenty of water for every purpose always on tap — in the kitchen, bathroom, milk house, barn, garage, and for sprinkling lawn and garden. Soft or hard water, hot or cold!

Water from Several Sources

Water from the well, spring, cistern, lake or stream — pumped from one, two ot three sources at the same time with *one National power unit*, which may be placed *anywhere* — 10 feet or 10 miles from the source of supply! Put it in the barn, basement, garage, shed — *any place!*

No Water Storage Tank



Water pumped against any lift up to 150 feet without clanking pump rods and without a surface pump. Water under strong faucet pressure without the use of a water storage tank of any kind. Nothing to freeze in Winter; no chance for water to get warm and stale in Summer!

New Power Unit

Nothing since the invention of the "OK" National Pump has created a greater interest than the National Power Unit. Gas engine or electric operated. Patented sleeve-valve compressor—no troublesome check valves, no unloading valve for starting. Quiet beyond belief. More water with less power consumption. And for the first time, here is an air compressor that can be operated *continuously*, hour after hour. Capacities range from 200 to 2,000 gallons per hour.

Write for copy of the interesting 32-page book, "Fresh Water", illustrating many successful farm installations. Please state number of livestock and years you have owned your farm.

NATIONAL UTILITIES CORPORATION
314 Belleview Place
Milwaukee, Wis.
Subsidiary of National Brake & Electric Co., Division of Westinghouse Air Brake Co.

"OK" National deep well pumps are made to fit 4, 5, and 6-in. well casings. Also furnished in shallow submergence type for open water.

National FRESH WATER SYSTEM
FOR FARM & SUBURBAN HOMES

We are always pleased to receive suggestions in regard to every department of Hoard's Dairyman.

handy woman soon learns to use combinations that are new and very delicious, and when once she has her pantry equipped with a few of the things that can be thrown together hastily into a quick meal, she need dread no emergencies. It is quite true that such makeshifts would not do for every day. For steady diet there is nothing like well selected, well cooked food.—S. K. ORMOND.

A Stork Party

One of our readers recently wrote me saying that she was planning to have a stork party; could I suggest anything to do. I must admit that I was stumped for I had never been to or given a stork party nor had any of my friends; furthermore, none of the amusement books seemed to take such things into consideration.

I did, however, remember a game I had once played which I thought could furnish a good deal of amusement at such an affair. This is the way to play it: Give each person a pencil and paper and let one of the party suggest a certain letter of the alphabet, any one she pleases, only it should be a fairly simple one such as S. Then tell each one to write down as many names for the prospective baby as she can think of, all of them beginning with S. Give them ten minutes, or less if you wish, and then have all stop writing and put nothing more down.

Beginning with any one of them, have her read the list she has written. Suppose she starts out with Scott; if anyone else has that name written on her list the name must be discarded but if no one else has thought of Scott, the reader may give herself a grade of one. Continue until all have read their lists and give a prize to the one who makes the highest grade. The prize may be a box of animal crackers or a paper of safety pins. Of course there will be all the common names like Susan, Sarah, and so on, but there will be mixed in with these a lot that will make ridiculous combinations with the last name—Simon, Sinbad (the sailor), Snookums (the funny paper), Samson, Solomon, Salome, Sennacherib, and other Biblical names. Let someone else choose another letter and continue until you feel that the baby is well named.

If you want to give a guest prize for the mother, it might be one of those little round things that some people hang around the baby's neck with "Don't Kiss Me" printed on it. They can be had for about fifty cents from any of the larger dry goods stores.

If you want to give the mother a very practical present, provide yourself with the material needed for all the diapers for the baby, have them cut out in advance and let each guest hem one or more. It is a gift that any mother will appreciate.—LUCY THOMPSON.

Sour Cream Pie

1 cup of sour cream
1 cup sugar
1 cup of seedless raisins
1 teaspoon cinnamon
2 eggs
1 tablespoon flour
1 tablespoon butter
1 teaspoon vanilla
½ teaspoon cloves.

Put sugar in a granite pan, add flour, cinnamon, cloves, vanilla, yolks of eggs, sour cream. Stir well, add raisins, boil until thick. Bake the crust. Pour in the cream filling. Beat the whites of eggs stiff, then add two tablespoons of sugar. Beat in well. Spread over top and brown.—Household Nutrition.

Rural School Sanitation

The Board of Health of Wisconsin has recenty gone into the matter of what can be done for rural schools in cases where sanitary conditions are bad and where the school board does nothing to improve them. They are frequently in receipt of reports that state that certain schools are not properly heated, drinking water is not furnished, toilet facilities are lacking or else are in a deplorably bad condition, the school room is filled with smoke on account of defective flues and so on.

The Board has looked into the rights of the school patrons in this matter and their findings, while not applicable in every state, may furnish a clue to the proper procedure. The state superintendent of schools advises that "state aid cannot be denied a school district on the ground that the school board members have failed to provide adequate sanitary equipment." State aid consists mostly in taking the lead as to giving warnings to the school board and by cutting the district off from its share of the mill tax until the order has been carried out. If for two successive years the district fails to carry out instructions as to proper maintenance of the school property, the district can be abolished by the county superintendent of schools.—LUCY THOMPSON.

Spring is Here

Spring is coming! Do you know
Where the pussy-willows grow?
Down beside the little stream
Where the wavelets dance and gleam.

Spring is coming! Do you hear
Robin singing sweet and clear?
Yes, he sings a song for me,
In the budding cherry tree.

Spring is here! We romp and play
All the live-long, sunny day;
Not a care nor trouble, we,
We're as happy as can be.

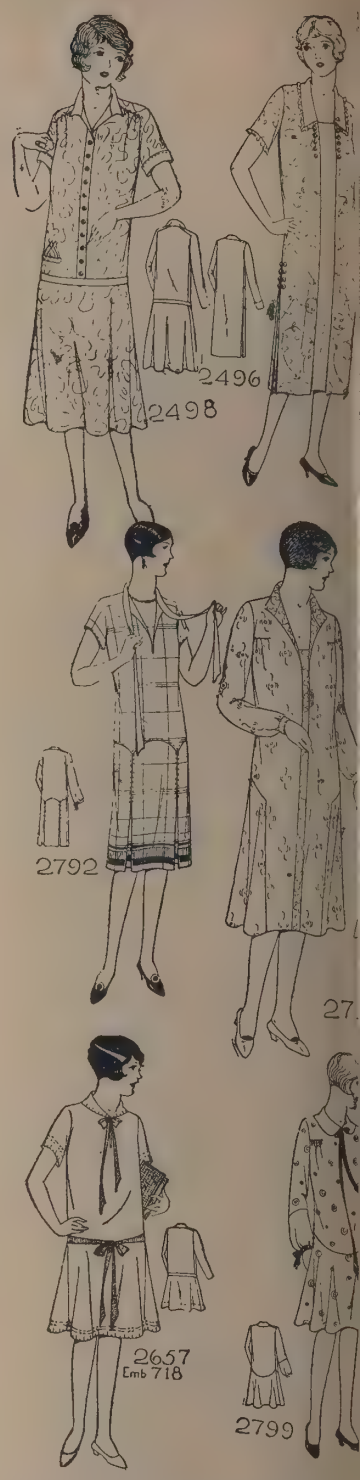
—EULA G. LINCOLN.

"You won't go to the theater with me in your old hat?"

"Certainly not!"

"That's just what I thought, so I didn't buy a ticket for you."

What's Wrong?



Serious errors in dress that border on the ridiculous. Errors made every day by women who should know better.

Our Spring and Summer Fashion Magazine shows these women as they should be dressed and points out other glaring faults and correctives. See Page 4.

Also there are dressmaking hints, a Beauty Article and a very pleasing variety of styles to choose from, any one of which you could easily make for yourself. The supply of these books is limited. So send 10 cents for your copy today. Address Fashion Dept., Hoard's Dairyman, Fort Atkinson, Wis.

Marketing Knowledge Deficient

Boost for Co-operation

D. D. BRUBAKER, MINNESOTA

NOW that farm legislation seems to be a hopeless and visionary pot of gold at the rainbow's end, we hear a lot about farmers cutting down expenses still further, producing more economically, getting higher producing cows, using more fertilizer, working longer hours to save hired help in a strenuous attempt to beat old "financial hell" by making more complete failures of themselves and families. Of course, economy and efficiency are always advisable but let's see about much increased farm economy.

Why should the bricklayer's wife have an electric washer, electric mangle, electric iron, electric vacuum sweeper, hot and cold water in her laundry and kitchen sink, while a farmer's wife works the armstrong movement at the pump sometimes clear out to the barn to get the dirt out of her weekly wash, with elbow grease, in the woodshed or her overcrowded kitchen.

I'll tell you why: Her husband lacks something above the ears.

When I was a boy, a labor union was more of a joke among laborers than co-operation is among farmers today. You go out and hire a bricklayer, carpenter, or milk wagon driver and see if the unions are a joke now. They are taking care of their own business in pretty fair shape and with few exceptions; they are loyal to their unions and do not violate the scales. A whole lot has been added above laborers' ears in the last thirty years.

When laborers wanted more pay, they didn't go out and work more hours a day. They went to the union meeting and voted to cut down the working day from ten to eight hours. They created a shortage of labor. How does the farmer do it? He plows and sows and reaps with a motor that eats gasoline instead of oats, yet he raises more oats than ever before. Who does he think is going to use these oats?

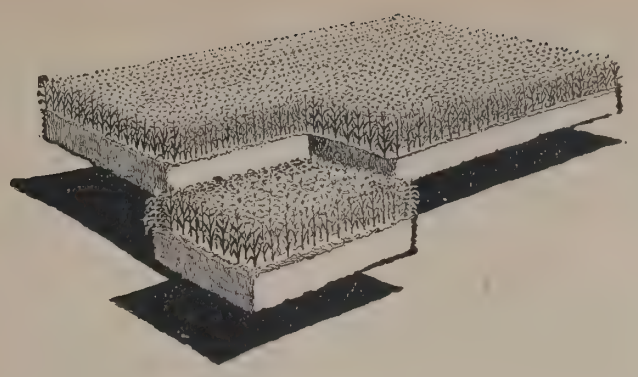
According to the Cornell University February report of farm conditions, the weekly earning of New York factory workers was 2.32 times greater wages of the same class of workers and farm prices for February were 1.33 times pre-war prices. Today eight years now farm prices have been going down and factory workers' wages have been going up. Twenty-five years ago we used to think that oats were cheap when they were below a cent a pound. Last fall there were lots of farmers in this section of the country that sold their oats at around a cent a pound yet the average farmer continues to raise oats.

You could take a cross section of farmers' heads, lawyers' heads, millionaires' heads, or any other heads that you want to pick out and they would probably all look alike and measure about alike. Farmers haven't any less brains than the rest of the world; they simply lack some of the knowledge of how to work together, but that's an awful shortcoming in this day and age. In fact, I think that on the average, individual farmers put more thought into their business than most other folks do, but our civilization has grown very much like a mushroom. It has sprung up in the dark without any guidance or cultivation. Mechanically, there are enough farm devices to make the farmer as efficient a factory for producing foodstuffs as any other institution on earth. Technically, our farm schools have turned out as much valuable crop and live stock information as any commercial laboratory you can find. It's in his marketing knowledge that the farmer is way back there where his great grandfather was; before there were any milk pans, cans, or separators, or milking machines, or seeders, or reapers, or tractors, or trucks, or anything else but two willing hands, a few simple tools, and an indomitable will. The fungus of farm finances failed to fertilize.

Other business has been congregated in cities where men could consult and arbitrate with each other in settling their competitive differences, while farmers have been segregated so that they have competed with each other instead of co-operating. In the nature of things, it has been hard for farmers to work together in the business end of farming. Nevertheless, that working together is necessary. You couldn't make a 1927 car go with a 1900 engine in it. The gears wouldn't mesh.

This great modern, financial, and commercial America of ours might be likened to a 1927 car in which the engine is the farmer, for he furnishes the raw material, the power, that makes the thing go. For the last few years the engine has been squeaking and crying and the gears have been grinding and chattering.

Farm legislation proposes to grease up this old engine and do her up with hay wire and binder twine and force her to keep on delivering power for this new shiny 1927 financial bus we ride around in. Apparently, no one has thought of putting in a set of new pistons or driving gears. Just stop the noise and make the old thing go. Some day she may fall all to pieces like the one horse shay, but when that time comes we will do something else.



Government handling of farm crops would take away the individuality and initiative from farmers. There would never be any need or any opportunity for a capable man on the farm to use his head; just his broad, strong back to produce more, to create more surplus to increase the equalization fee to keep prices down where they are now. What's the use of trying to fool farmers with that stuff.

Now listen: This is supposed to be a representative government. Generally speaking, the majority rules. Roughly, seventy per cent of our population is composed of non-agricultural consumers. Regardless of the individuals composing any federal farm board, that other seventy per cent, who are better organized than farmers, could annihilate that federal farm board more easily than it was created if food prices were to go too high. Wouldn't that be a fine condition for farmers to pin their faith to.

The timer, driving gears, main shaft, and magneto of this engine must fit into the chassis and rear axle. Farmers' business must be built on the same plan as other business or it isn't going to mesh in and work. The incentive for developing and improving farm marketing methods has to be individual gain. The source of the improvements has to be individual initiative. We in America haven't yet arrived at the condition of social and financial equality they are striving for in Russia.

Farmers will have to learn to handle their products in their own local communities, then combine by states or localities and then nationally. It will take years but I hope we didn't ever expect Uncle Sam to reach into his hat and pull out a federal farm board all trained in handling these billions of farm dollars, and the clerks, inspectors, leaders, and laborers and the machinery to do this work inside of years.

Co-operation is on the way and you can't stop it. Better get behind and push.

Save a Fifth of Your Corn

Crop Insurance at Only 4c an Acre

EXPERIENCE has taught you to expect a 20 per cent to 30 per cent loss of your corn due to root, stalk, and ear rots. How much is a fifth to a third of your corn crop worth to you? You can save it at the insignificant cost of only 4 cents an acre. Three ounces of Semesan will treat a whole bushel of corn, sufficient for planting eight acres. Semesan will give you the same yield with fewer planted acres—save land, save seed, save planting, cultivating and harvesting labor. And your corn will be finer quality.

SEMESAN JR.

For the Prevention and Cure of Field and Sweet Corn Diseases

Simple to apply in dust form. No bulky solutions to handle. No skill, no elaborate equipment. Harmless to seed germs, deadly to all fungus. Ask your county agent to tell you about the Government tests of Semesan treatments on corn and other crops.

Prove it to your own satisfaction: Stokely Brothers and Company, of Newport, Tenn., did. They wrote a while ago: "We tested twelve different lots of seed corn, in boxes filled with earth that was well contaminated with bacteria of all kinds. On some of our seed corn which, through accident, was permitted to mold and heat slightly in the sacks, the Semesan treatment proved decidedly effective. The untreated, damaged seed corn germinated 30% weak while the Semesan-treated germinated 66% strong. We are positive that Semesan will greatly increase the germination percentage of corn."

Send this coupon for booklet that tells how to make more money out of corn.

Dairy Exposition to be Held At Memphis

The twenty-first annual National Dairy Exposition will be held in Memphis, Tennessee, in connection with the Tri-State Fair. The dates are October 15 to 22.

Arrangements have been made by the Exposition and Fair Associations whereby the two events will be combined for the year in one big agricultural exposition. The large cattle barn will be devoted entirely to dairy cattle entered in the Exposition and a judging arena will be provided immediately adjoining the barn. The farm and barn machinery and equipment exhibits will be housed in a commodious building which is being designed for this purpose. It will be large enough to contain the United States Department of Agriculture display, dairy products exhibits, boys' and girls' club activities, and other educational features of the Exposition.

The Executive Committee of the National Dairy Association decided to hold the Exposition in the South this year because of the rapid development of dairying and the demand for diversified agriculture in that section. Memphis is centrally located and has splendid railroad facilities which make it easy to reach from all parts of the country. The hotel facilities are very good.

Arrangements are under way for holding the 1928 Exposition in St. Louis, in buildings to be erected especially for it.

There are reasons why

Portland means permanence

Our Vitrified Tile Building Blocks are perfectly insulated; most economical material for out-buildings

and Portland Silos have withstood fire, wind, and time.

Wet-mix staves, curved, tongued and grooved on both sides and both ends, sealed by our special process to the other staves at sides and ends, perfectly fitting hoops—make Portland Silos sturdy. Additional features mean convenience and better silage. Write for booklets. We also make vitrified tile, glazed and unglazed, silos; clay building blocks. Use a Portland Silo.

Farm Forestry for Juniors

HOW would you like to live in a place where there was no wood and you couldn't get any?

Right away some of you boys may think, "Great! No wood to split, no kindling box to fill, no bucking the big saw with dad or brother, no axe to swing."

That's all right, but think of the other things you would miss. What kind of a barn could you have, what kind of a house, in fact what kind of buildings could you have on your farm? Or in town? The wheels of industry depend much more than you may realize on wood to keep going. What would we do for baseball bats; telephone poles; fence posts; railroad ties; pencils; paper; handles for tools such as hoes, pitchforks, shovels; hay racks? You can scarcely mention an article of common use that does not depend more or less on wood for its successful operation.

The great American forests are vanishing. Unless something is done to replace them there may yet be a woodless world. When Columbus discovered America it was covered with an almost limitless expanse of magnificent trees. As the white man settled here he had to clear land for dwellings and for cultivation. We are now facing a serious wood situation.

The axe, forest fires, insects, and disease take their annual toll and have reduced this stand of timber from 822,000,000 acres in the time of the red man to less than 138,000,000 acres of untouched forest now. Our forests are disappearing 4½ times as fast as we are replacing them. In 1924 forest fires burned over an area almost as large as the state of New York.

We are a wood using nation. We use about 23 billion cubic feet of wood a year. This means that about 250,000,000 trees are cut. If these trees grew in one solid forest they would cover an area about the size of Massachusetts, Connecticut, and New Jersey.

Do you know that about a billion wooden pencils are used every year? That it takes 16 acres of spruce trees to make enough paper to print just one Sunday edition of a metropolitan newspaper? That every four years enough newsprint is manufactured to make a strip as wide as a daily paper and long enough to reach to the sun and back?

If we continue eating up our wood supply at this neck-breaking pace where will we get our wood when this is gone? There are millions of idle acres not suited for agricultural use that are well fitted for growing trees. What a wonderful chance for you farm boys and girls to "plant trees and grow up with them!"

CLUB BOY CUTTING PINE CONES FOR SEED

The farm woodlot is important. Trees add beauty to the farm, increasing its value. Trees give storm protection. Properly planted windbreaks save fuel.

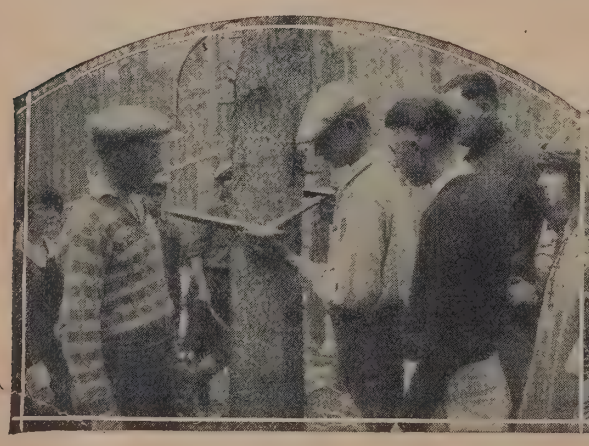
Boys and girls to the rescue! Nineteen states now have forestry work for 4-H club members on their program. New Hampshire, Vermont, Massachusetts, New York, Pennsylvania, Maryland, Kansas, South Carolina, Alabama, Tennessee, Louisiana, Oklahoma, and Colorado in 1925 were the pioneers. Michigan, New Jersey, and Wisconsin began in 1926, and North Carolina, Connecticut and Minnesota have trails blazed for a busy 1927.

Vermont, thinks E. L. Ingalls, the state club leader, may lay claim to being the first to have a girls' forestry club. This one, in Orleans County, has 10 members who have been learning all sorts of woodcraft and are now planning to procure a tract of land and plant trees of their own.

Tennessee forestry club members are planting the pecks of black locust seeds this spring they gathered, dried, and stored as their means of entrance into the club last fall.

New York club members have planted 92,000 trees to date, 95 boys completing their projects.

New Hampshire forestry members planted 58,400 seedlings last year and did improvement work on 81 acres of woodland. There are 40 m bers to date. East Jaffrey clu Cheshire County has 30 members have improved eight acres of w land.



"Plant a forest and grow up the trees," say North Carolina estry club boys. Those who are planting may take charge of the provement of a half an acre of ber or may study tree identifica and quality of woods.

Connecticut also has outlined t phases of forestry work: woodc planting, and woodlot managem One of the features of the woodc enterprise is the building of a cabin or a lean-to.

New Jersey's first forestry organized in Warren County in 1 required that the members sh have the loan of at least one of abandoned or low-production land. On this the member ma combination planting of pine spruce, the pine as a timber crop the spruce as fillers to be rem at an early age for Christmas t This was planned to give the bo sizable income in six to eight y when most of them will need m to help finance their college ed tion or a farm enterprise of t own.

Pennsylvania's forestry club n bership increased from 15 to members last year, and every n ber completed the year's work. are interested in planting.

Wisconsin's members are ca "junior forest rangers." They advance through four "orders"— est crafter, forest planter, wo man, and cruiser. One thing a est crafter may learn is to ma bow and arrows with which he

A WATCH

For YOU!

Boys, here's a real timepiece of standard make—AN INGERSOLL RADIOLITE. You can tell time by it on the darkest night without a light.

All you have to do to get this dandy prize is send us four subscriptions to Hoard's Dairyman at $1.00 each. Easy, isn't it? You'll be surprised how quickly your neighbors will subscribe for Hoard's Dairyman when you tell them it's three long years for $1.00. Or, for 3 subscriptions we will send you the same watch without the Radiolite Dial.

Your watch is waiting for you. How soon may we send it?

HOARD'S DAIRYMAN
Fort Atkinson, Wisconsin

of the state. One hundred thousand trees have been reserved for the 1927 planting and double that for the 1928 planting. There are now more than 300 Wisconsin club members enrolled in forestry clubs.

There are several ways in which forestry club members can realize direct profits from their work. The Wisconsin State Club Department outlines them as follows:

1. Make collections of seeds to sell nurserymen.
2. Grow seedlings to sell to those making plantings.
3. Plant seedlings in some private estate.
4. Make wreaths of cedar for Christmas decoration.
5. Sell pine knots for Christmas fire in the fireplace.
6. Collect balsam needles to sell in sacks for pillows.
7. Make and sell maple sugar and syrup.

It is planned to establish a forestry camp in Northern Wisconsin where the club boys can earn their way. This camp would give a one week's course in practical forestry.

If you want additional information on forestry we suggest that you write for "The Forestry Primer" published by The American Tree Association, Washington, D. C. The Forest Service of the U. S. Department of Agriculture at Washington, D. C., will be glad to send you literature and answer your questions. The Cornell College of Agriculture at Ithaca, New York, has published some good forestry bulletins, as have several other state agricultural colleges.

[EDITOR'S NOTE:—This week, April 24 to 30, has been declared American Forestry Week by President Calvin Coolidge.]

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue. Let's talk it over.]

For further discussion of the following see the April 10th issue.

Is tuberculosis in cows a cause of tuberculosis in humans? "Yes," says Dr. C. H. Lochead of the Mayo Hospital, Minnesota, in the article "Bovine Tuberculosis in Humans."

How do tubercle germs get into milk? They may occur directly as a result of tuberculosis of the udder or they may occur in the milk indirectly through cow manure. With lung tuberculosis, the germs are coughed up, swallowed, and passed in the manure. This gets into the milk in many ways with which we are all familiar.

How does the germ enter the human body? By one route, the alimentary tract.

Are there as many deaths from tuberculosis as there used to be? "No," says Dr. C. H. Mayo. "Thirty years ago, the yearly deaths from tuberculosis in each 100,000 persons numbered over 200. They are now well under 100."

How would decentralization of industry help agriculture? By establishing relatively small plants in the rural districts, countless farmers' families would have the choice of a variety of occupations and would be able to realize the full measure of their earning capacity without disrupting home life. Secondly, it would bring electricity to many more farms. (See page 368.)

How much is land worth in Holland? Mr. Boer, who owns and operates 69 acres of land eight feet below sea level and entirely in grass, values it at $650 an acre. (See page 370.)

If clover has winter-killed, what legume crop can be substituted? Soy beans. (See page 370.)

What are some of the common varieties for Wisconsin? Manchu, Black Eyebrow, and Ito San in the southern half of the state and Pedigreed Blacks and Mandarins for the northern part of the state.

How should soy beans be planted? They may be sown with the regular corn planter, or grain drill. When beans are put in rows from 28 to 30 inches apart and dropped about 2 inches apart in the row, one bushel of soy beans will plant two acres. They may also be broadcast.

When should they be cut to make the best hay? Just after the little beans are beginning to develop. They usually reach the proper stage for making hay the latter part of August or first week in September.

How much milk was delivered to New York patrons in 1925? An average of 4,311,000 quarts of milk daily. In 1917 the average daily delivery totaled 1,600,722 quarts. Most of this milk was delivered by horse-drawn vehicles. (See page 384.)

Junior Letters

Homesteading in South Dakota

Hoard's Dairyman Juniors:—We came to South Dakota three years ago from town and like it very much on the farm. My father homesteaded a raw quarter, and we have about one hundred acres of it under cultivation now.

Last year we didn't raise any crop, although we planted it in March, and so will have to buy feed for our stock and turkeys this fall. Mamma has about 100 turkeys to sell this fall and have to buy all our corn. Some of them weigh 15½ lbs. Our turkeys are the White Holland breed.

We are milking eight cows in the morning and twelve at night. I milk three or four cows at a milking. I rather think it is fun to milk.

I graduated from the 8th grade this year, and as I could not get to a high school (the closest one being 40 miles away), I am reviewing the 8th grade. I am 13 years old, weigh 97 pounds, and am five feet tall. My birthday is on the 19th day of March.

If any juniors want to write to me, I will try to answer all letters I receive. My address is Sansarc, So. Dak. Leona Burns.

Winning in Club Work

Hoard's Dairyman Juniors:—I enjoy reading the Junior Page very much. My father has been a subscriber to Hoard's Dairyman for several years and he sure reads it, too. It is the farm paper he likes the best.

I sure like the club work; it is fun as well as educational. I certainly was well repaid for my work. I received from Pine County the blue ribbon and a free trip to the Minnesota State Fair with my calf, and a fine silver trophy from the Bankers' Association. I sure enjoyed my trip to the state fair where my calf again won two blue ribbons.

Now, after I am home, our club members elected me president of our local club and vice-president of our county organization and I am going to try my best to make our club do good work. My address is R. 2, Askov, Minnesota. Clifford P. Pedersen.

My Pony

Hoard's Dairyman Juniors:—I will have to tell you about the pony that I got for my birthday. She is a seal brown color and very fat. I have a little wagon, which is for a goat, and looks very funny with her, but papa put thills on it and fixed up a harness for her and I have lots of fun with her.

I have cultivated garden, mowed lawn, and used her on the wagon for odd jobs. Then I have ridden her after the cows and over to the neighbors. One time I was coming home and she threw me off and nearly broke my arm. But I still love her. I wish you could see her; she is a perfect picture. I almost forgot to tell you her name. It is Tootsie.

As I think I have written enough I will close and I sure want you to write to me. My address is Sand Creek, Mich.

Harold Elmore Willett.

THE PONY, HAROLD, HIS SISTER, AND ROVER

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the pin showing the head of your favorite breed of dairy cattle, and a handsome creed. Mail your membership application at once to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now!

They respect you—

when you weigh it on a

Fairbanks

The men you sell — the men of whom you buy — respect a man who is businesslike and they like to do business with him.

Guessing or bulk weighing or mere counting is unreliable. Accurate weighing of everything on your farm will save money and make money for you — also a reputation for accuracy. The scale that all respect for reliability is a Fairbanks Portable Scale, of course. The model illustrated is a remarkable value at $16.15, plus freight to your town. Please see your dealer.

A Minnesota Holstein Association Report

The Minnesota Holstein Breeders' Association recently sent us a report of the 1926 activities of the Ottertail Co. Holstein Association which is particularly interesting because it shows something of what can be accomplished by an active county breeders' association, in this case one whose members, 14 years ago, owned exactly two Holsteins.

During the year, the membership was increased from 18 to 114, the county being divided into districts with regular meetings in each district.

The pure-bred sire campaign sponsored by the state association and assisted in by the county organization resulted in the placing of 186 pure-bred sires, 41 per cent of them Holsteins.

A Holstein calf club with 44 members was organized and the county association assisted materially by loaning money to worthy boys and girls for the purchase of registered and grade calves.

The county sale manager plan was developed during 1926 and the two managers assisted in selling 253 Holsteins for association members.

A county show herd was exhibited at various county fairs and the state fair.

The county association was active in getting the required number of farmers signed up for the county area test for tuberculosis.

Certified Milk and Its Competitors

To certified milk, or more correctly its producers, is undoubtedly due a flag of leadership for showing not only our own country but the world what it is possible to do commercially in the way of cleanliness and cold in milk production.

With the local Medical Milk Commission as umpire to see that the game is played according to the rules, milk is regularly produced so clean and so cold that after traveling across the continent or even going to Europe and home again, it has been sweet for a month after it was drawn from the cow.

Certified milk represents the peak of man's efforts to produce clean, wholesome milk as free as possible from the faults and dangers of contamination to which a human food is inevitably subjected when drawn from an animal living in a barn, yard, or pasture.

Certified milk has passed from a product often produced by men of wealth, who use the salve of "altruism," "love of human service," the "lure of the land," or something else to cover up their regrets when they found it cost more to produce than it sold for.

It has become a business to produce certified milk at a profit.

This means, known costs in detail, elimination of the unessential. It also means daily volume, reduced delivery expense, development of new business. Here is where the competition comes in.

"Pasteurized milk,"—Grade A, Grade AA—"Guernsey Milk," "White Nectar," "Guaranteed Milk," and just common "milk," one or several are competing for the attention of the housekeeper, the home maker's and the mother's dollar.

Modern competitive business says —"Praise your own goods—render service—don't knock your competitors."

Certified milk has certain assets no other milk can claim. Build business on these assets.

High Production, Low Feed Cost

In 1926 **ALL JERSEYS** officially tested for 365 days **AVERAGED 10,209 LBS. OF MILK, 545.20 LBS. OF BUTTERFAT.**

You *can* have heavy production of high quality milk in your herd without a heavy outlay. Jerseys purchased at present prices will prove to be a very profitable investment. Prices are moderate and Jerseys produce at a remarkably low feed cost.

Write today for free information on Jersey cattle. Assistance in locating stock may also be obtained without cost.

THE AMERICAN JERSEY CATTLE CLUB, Dept. B, 324 West 23d Street, NEW YORK

1. Every cow is examined for health, frequently.
2. Every barn is cared for above the average.
3. Every attendant is a selected man.
4. All feeds are chosen for quality and uniformity.
5. All utensils are sterilized regularly.

In fact, everything known to the mind of man is done to produce a clean, cold, safe, raw milk.

Then on top of this a disinterested —neutral—scientifically trained umpire; the Medical Milk Commission, with its inspectors and laboratory tests, watches the business and certifies to the public that the care is taken and results secured.

All things human are comparative. More people are killed annually by automobiles than by guns or axes—yet, we sometimes hang the murderer who uses the axe or gun and let the others go free.

Certified milk should be raw—say you; certified milk should be pasteurized—say some; certified milk should be boiled—say others; all milk should be pasteurized or all milk should be boiled to please some people. You cannot please all by any one practice.

Let us recognize the humanly practicable.

Certified milk as a class is the best raw milk we know how to produce on a commercial scale. It costs more to produce this kind of milk than many people can or will pay for. We might as well admit it and build our business with due regard to this rock which we cannot remove or climb over, so we must go around.

There are many people who want milk clean, cold, safe, and raw, milk which has all the care and protection known to science and business. They will pay a fair price for it. This is the market for certified milk. A market not yet saturated, for new homes, new mothers, new lives by the thousand start each day.

Some may want certified milk pasteurized or even boiled. Let them do it, but don't require something done to all certified milk which cannot be undone and which figures may show is after all as not a conclusive necessity.

But, Mr. Certified Milk Producer, just as surely as I believe in the foregoing, I believe that the safest milk for the mass of people in a city of any size is good clean milk pasteurized. The human factor or even the mechanical factor may sometimes fail in the production of certified milk and of pasteurized market milk, yet the fact remains that common practice in certified milk production and in pasteurization of the general milk supply of modern cities gives American homes a larger proportion of healthful milk free from disease, than is found in any country of the world.

But let us not forget that certified or pasteurized milk is not universally available even in this land of ours. A health worker found a community where she saw no child seven years of age or under who had ever had a drink of fresh milk. Condensed or evaporated milk in tin cans had been the life saver of practically every child in that community.

The art and practice of concentrating milk by drying has reached the commercial stage and many pediatricians and welfare workers in this and other communities are finding it the salvation of youngsters by the score.

The essence of my message is that the crying need of today is that many children need more *milk* for their own health's sake.

We should *subordinate* to this thought whatever claim to glory a particular brand of milk may have, and advocate first an adequate consumption of milk daily.

Second, to present the claim of the different kinds of milk that the consumer may select—the kind that meets his or her pocket and taste and ideals. Build the demand for milk—don't knock any good milk.—An address by H. E. VanNorman before the annual meeting of the Certified Milk Producers' Association of America.

MUELLER-CORY HATCHERY, 207 Main St., FORT ATKINSON, WIS.

Figure This Up!—

100 Blackhawk Accredited chicks hatched from flocks producing 140 to 160 eggs per year or better at $15.00 per 100.

100 ordinary hatchery chicks hatched from flocks of unknown egg production, probably not more than 80 to 90 eggs per year, which is high average for this type of flock at...$12.00 per 100.

As the offspring will be no better than the flocks which produced them, which is the cheapest?

Drop a postal for our fine 48 page catalog for the answer and see unretouched photographs of the flocks producing our hatching eggs, also each breed of chicks we hatch ready to ship.

Poultry on the Dairy Farm

New Furniture

The completion of the walls, floor, and roof of a poultry house means that the job is just nicely started. In this day when music in the dairy barn is supposed to sooth a cow sufficiently to result in an increased production; when artistic, harmonious, interior decorating of the home leads to a compatability that will prevent divorce, it may be possible to improve egg production by proper selection of the equipment for the laying house.

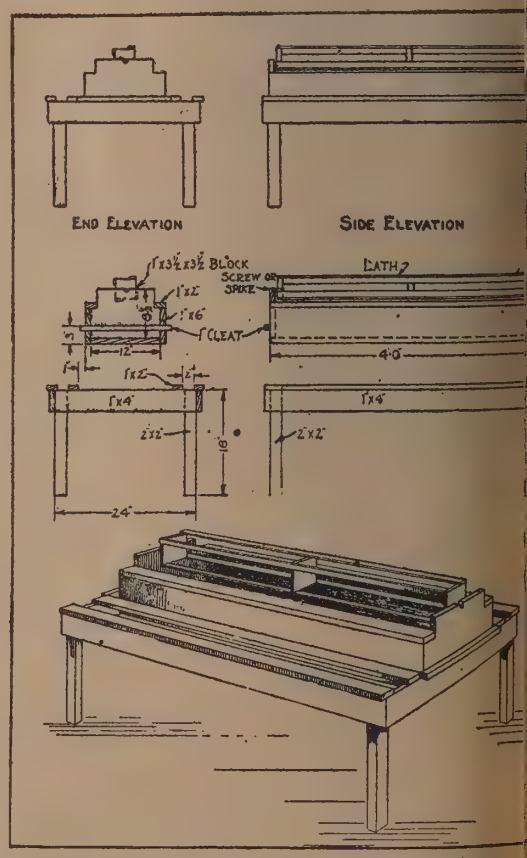
It is a positive fact that proper attention to what is really needed in a poultry house will assist materially in decreasing labor, lowering production costs, and increasing profit. When one has an opportunity to view the motley array of things that have, can, and should not be inflicted on a house in the way of equipment, it is not wondered why a flock can lose all idea of producing. There is a limit to all things.

First in importance and consideration is the mash feeder. This seems to be the starting point in the career of every poultry keeper. Some of them make a mash feeder because they keep chickens, while others only keep chickens as an excuse for designing a mash feeder. The rest either take something from someone else or use a substitute. Substitute feeders include hog troughs, iron kettles, half of the available kitchen utensils ranging from dish pans to pie tins or broken crockery and often means only an open box. The mash mixture in these instances would of necessity have to be powerful enough to act as a plaster applied externally. It is in most instances kicked into the litter, wasted, and then a complaint is raised because no results were obtained.

As indicated, there are an endless variety of mash feeding devices available. Regardless of what type one may adopt, it is necessary that the feeder have the mash available for the flock, eliminate waste, permit the hens to see what they are getting, and be sufficient in number to accommodate the entire flock.

Most of the wall type feeders are objectionable when considered on that basis. A particular type may be made that will feed a certain mixture. With a change in the mash it will either usually feed too fast and waste or will clog. One, then, must revert to the old practice of hitting it a kick every time in passing. A second objection is raised in that the wall feeders force the flock to work in the dark, since the light is cut off and decreases the number ing at one time since only one opened.

Nothing apparently is perfe the home-made type here recon ed is criticised because it de filling at regular intervals. T an advantage since regular means fresh mash and a bette ception of the proportion which between grain and mash consur This proportion is the check c nomical feeding.



The cut gives one a definite i the construction of this feeder bottom is a 1″x12″, the side 1″x6″, and ends are 8½″ wid 1″x2″ strip is used on each sid lip to prevent wasting. Usuall advisable to set these sloping de a thirty degree angle to permi feeding space between this stri the reel.

A reel made of building lath and nailed on three 2″x3½′ pieces, revolving freely, preven hens from roosting. The entir struction is set on a stand ei inches high so that it can be r removed and cleaned. This t feeder is the equivalent of two foot wall hoppers since the flo access to both sides.

A storage bin used in conju with this makes a suitable ar ment and facilitates feeding. Th of the material required depend local prices, for the labor and required in constructing is small.

Roosts and Dropping Boar

In any building one assume all of the floor space will be av for the flock. This requires th

OOCO CHIX FOR WINTER EGG PRODUCTION

QUALITY BEGETS QUALITY *Be sure the parent stock of the chix you buy are Pure-bred, vigorous egg-DON'T EXPERIMENT producers.*

Our flocks are rigidly inspected and accredited by state department. Proven producers with the ability to transmit same to their off-spring. Can furnish stock of trap-nest flocks with records of 200 to 260 eggs in 365 days. Years of experience—large capacity—extra good shipping facilities. Buy OOCO Vitality chix from COLD WEATHER HEAVY EGG PRODUCERS. Order now and get your chix when you want them. Send for a catalog and prices.

THE OOCO CHICKERIES OCONOMOWOC, WISCONSIN

material such as iron pipe should absolutely be discouraged.

Any and every wood roost should be painted when built and at least once yearly thereafter with some good wood preservative. A thorough application once a year will tend to control mites satisfactorily. This is the only known means because, in so far as is known, no particular kind acts as a constant deterrent to the parasites.

Beneath the roosts should be nailed, and brought down the front, one-inch mesh poultry netting. The use of this netting assists in disease control, since it keeps the fowl from contact with the droppings; promotes cleaner eggs by keeping the hens' feet clean and retains any egg which may be laid while the hen is roosting. This represents a small but valuable investment.

Nests

The nests should never be suspended beneath the dropping boards. That is the dirtiest part of the house and hanging them in that place defeats the purpose of the dropping boards by cutting off the light. Both end walls are available when this type of mash feeder is used.

A nest 12"x14"x14" is sufficiently large. These can be banked at least three tiers high which will give sections of fifteen or more. It is not necessary to construct these with a back since they will hang on the end wall. Cleaning is facilitated without a back since swinging them out at the bottom allows the nesting material to drop out.

A 1"x6" strip attached by hinges to a 1"x4" strip allows for a run board on the front and keeps the nests closed at night if the hinges are put on backward. They can in this way act like brackets. The top of the nest should be slanted to discourage roosting.

There is always sufficient debate concerning the merits and demerits of open or closed nests. Personally there doesn't seem to be much reason or necessity for making the nests dark. If, however, it would make the flock owner feel better to provide the hens with nests of that kind on the assumption that they need solitude to concentrate on egg making, it may be advisable. The entire bank of nests may be moved out from the wall and entrance permitted from the back. A narrow board rather than a full walk will assist in keeping that portion cleaner and will tend to prevent the flock from laying in the run-way rather than the nests.

The watering device can be arranged when a pail or light vessel is used. The stand may be of slat construction to promote cleanliness and with a central hole or opening to retain the vessel.

All equipment must be built up off the floor.

The only other items that may be needed are long troughs for feeding moist mash. They are placed on the floor only when feeding and are then hung on the wall.

Grit and shell hoppers can be placed on the wall beneath the windows.

A certain amount of equipment is required. That may be either home-made, purchased, or a combination of

FLOCKS BLOOD TESTED

Our Flocks of Pure Bred, High Quality, Heavy Laying Fowls are annually tested for BOTH WHITE DIARRHEA AND TUBERCULOSIS under University of Illinois supervision. 35,000 HENS UNDER TEST. LARGEST PLANT IN THE WORLD PRODUCING CHICKS FROM BLOOD TESTED FLOCKS ONLY.

FOR CALVES AND POULTRY
POWDERED SKIM MILK

Feed powdered skim milk of first quality which you now can buy direct from The Twin City Milk Producers Assn., an organization of 7,000 farmers.

For calves: Skim Milk Powder is an excellent food: one pound in a gallon of water is more nourishing than 1 gal. of skim milk fresh from the separator.

For poultry: the best cure for Coccidiosis. A valuable feed for growing chicks, laying hens, breeders and for fattening. Buy skim milk powder (roller process) direct from our plants. Send $10 for 100 # sack or write for information. 2395 University Ave., St. Paul

TWIN CITY MILK PRODUCERS ASSN.

the two. When enough is available don't carry it to extremes by installing banana stalks, magic bottles, or other things to control mites, lice, and disease. Most of these are Paul Bunyan stories on a par with the "Blue Ox." Make the house comfortable and install enough equipment of the right sort to cut labor demands to a minimum. Any additional increases the overhead.—J. B. HAYES.

Worms Cut Down Egg Yield

That hens can't feed worms and lay eggs too is ever a point to keep in mind. It is a dual tax on flocks.

Pale combs—unthriftiness plus unusual appetite—paralysis—and diarrhea all point to worm infection of some sort.

Round worms, varying from microscopically small ones to those one-half to four inches in length, are commonly found in infected chickens' bowels. The flat, segmented type, the tapeworm, is even more tenacious in its habits and harder to get rid of than the round worms.

Oil of chenopodium—one tablespoon mixed with six ounces of cottonseed oil—has proven very effective in ridding chickens of round worms. One tablespoon doses of this mixture for adult chickens and less in proportion with partially grown chicks, is given by rectal injections, using an infant's enema syringe.

To rid poultry of tapeworms has always been quite difficult, until a drug known as kamala, an East Indian product, was recently discovered to be a very efficient remedy. It is harmless and effective, nearly 100 per cent so, reports the veterinary department at the University of Wisconsin, where the properties of kamala were brought to light.

They direct treatment to begin with an 18 to 24 hour fast, after which the kamala should be fed to the flock in a quantity of corn meal or dry bread crumbs, about a third as much in amount as the flock would ordinarily eat in one meal. Doses are computed according to the approximate weights of the chickens.

Birds weighing ½—1 lb. need ¾ grams.

Birds weighing 1—3 lbs. need 1 gram.

Birds weighing 3 lbs. or over need 2 grams.

Determining Sex by Eggs

Please tell me if there is any possible way of distinguishing sex in chickens by the shape of the eggs. If there is any other way I would like to know.

West Branch, Iowa. F. Y.

There has been some sort of a prehistoric idea inherited by each succeeding generation from the time of the establishment of the first hen's egg to the effect that there was a correlation between the shape of the egg and the sex of the chick. It is, I believe, thought that the round egg held a pullet and the pointed ones had cockerels, or vice versa.

This is, however, just one of the faddy, unfounded but accepted ideas that seem to be especially prevalent in connection with poultry keeping. We know, or rather believe, that this question of size of egg and shape of egg and color is an inherited characteristic as established by some work by Benjamin, and believe that as a person was to go on the principle of shape of egg controlling sex that in a short time we would have a flock developing eggs that would not be acceptable or desirable as a market type. In fact I have known of a few instances where the idea has been carried out and after a few years the eggs in the crate wo

Professor Hunziker on Foreign Trip

fessor O. F. Hunziker, director
research dairy laboratories of
lue Valley Creamery Company,
go, and manager of the butter
facturing department of that
ny, sails from San Francisco
20 for New Zealand and Aus-
He will be accompanied by
Hunziker, and the trip will take
four months.

tour is made to accept invita-
extended to Professor Hunziker
ding associations of creamery and dairymen in the two countries, to address their annual state conventions. He is the first American dairy scientist to be honored in this manner. State conventions in those countries usually last a week each, have large butter and machinery exhibits, and are big factors in the advancement of the industry.

Professor Hunziker's books, "The Butter Industry" and "Condensed Milk and Milk Powder," as well as many scientific papers on dairy manufacture, have made him a world authority in this field. In each country visited, official arrangements have been made for him to study dairy manufacturing problems at first hand and then address the important meetings of leaders in the dairy improvement work now going on there.

Illinois. H. SANDHOLT.

Illinois State Champion Four-year-old

One of the best four-year-old Guernsey cows of the year is Pergue's Lassie Beda, owned by H. C. Horneman of Illinois. Her recently completed record of 14,973.6 lbs. milk containing 750.6 lbs. fat is the highest class B, or four year-old, record ever made in Illinois.—The American Guernsey Cattle Club.

"MILKING ONLY ONE TEAT"

is the title of a very interesting and instructive folder which every dairyman should read. It can be had *free-of-charge*, by sending your name and address to

Fair Grounds

VIROQUA, WIS., SATURDAY, MAY 7

E. W. SCHELLING, Sales Manager

VIROQUA WISCONSIN

WHY BUY SHODDY?

You know that buying shoddy clothing or shoes is not economy. It is foolish extravagance. Buying a "shoddy" bull is even worse.

A shoddy suit of clothes you pay for once and the waste is stopped.

A "shoddy" bull you pay for over and over again in wasted time and work and expense. The bull calves have little value. The heifers are worse, because you keep on paying without getting results. You end up buried in debts and discouragement. What we don't do today is what causes most of the trouble tomorrow. Get rid of that "shoddy" bull now. Get a bull you will be proud of; a bull that will give you bull calves that will bring a good price; a bull that will give you heifers that will MAKE MONEY for you.

We have the RIGHT BULL at the RIGHT PRICE

A Necessity — Not a Luxury

Floors of Circle A Cork Brick are not "fancy" floors for "fancy" barns, but common-sense, good-business floors for any barn where cows are worth keeping up to "top notch" in health and productivity.

Circle A Cork Brick make *warm* floors, *dry* floors, *nonabsorbent* and *sanitary* floors. They make floors that cows can't *slip* on. They protect from chill and dampness, from disease and accident—a safeguard against garget and rheumatism and against strains and "bunchy" joints.

That isn't luxury. It is good business —common-sense protection for your investment in good cows.

Write for the book, "Circle A Cork Brick Floors," and a sample. ARMSTRONG CORK & INSULATION COMPANY, *Division of Armstrong Cork Company, 112 Twenty-fourth Street, Pittsburgh, Pa.*

Electricity in the Country Home

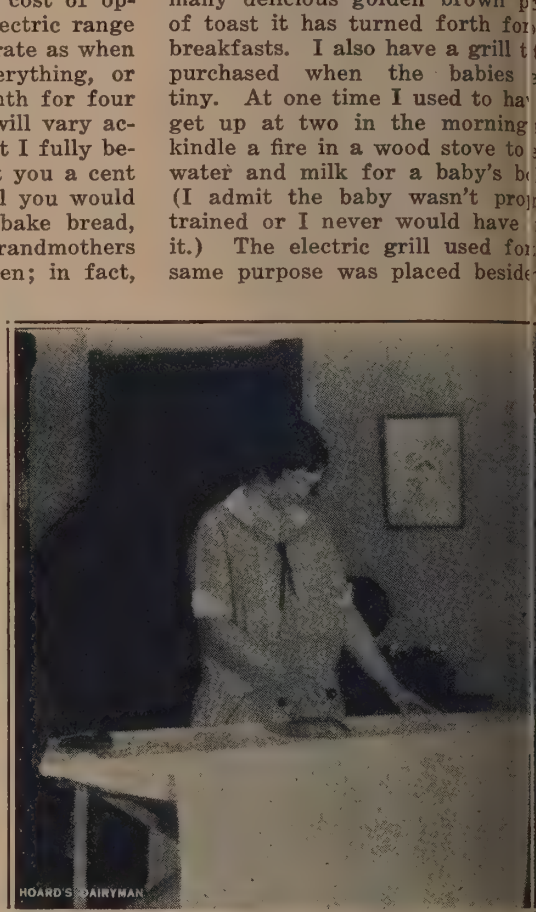
(Continued from page 437)

on high until my water boils, and then on low, which will keep it at the boiling point.

There are two types of burners, the open and closed elements. The open ones heat much faster but are far more liable to burn out, especially if something boils over on the burner itself, and then they have to be replaced. The closed elements take much longer to get hot but when they once have become thoroughly heated they retain the heat much longer. One can turn one of these burners off quite a while before you are through cooking on it. This means quite a saving in fuel.

When it comes to the cost of operating I find that my electric range costs me the same to operate as when I used gasoline for everything, or about four dollars a month for four people. Of course this will vary according to your rates, but I fully believe that it will not cost you a cent more than any other fuel you would have to buy. One can bake bread, like our mothers and grandmothers baked, in an electric oven; in fact, anything that can be baked at all can be baked perfectly in an electric oven. There is no doubt that electricity is the ideal fuel for cooking.

The electric refrigerator is something that will some day be quite common upon the farm. We farm women have longed for this for a long time. City people little realize what a problem we have in the summer to keep food without ice and the electric refrigerator manufactures its own ice. These refrigerators have been very expensive but the price is gradually coming within our reach. Many frozen desserts may be made in these too. The many disagreeable features that are a part of the old ice box are entirely done away with in this.



An electric mangle saves a great deal of ironing. Anything that is straight such as sheets, table cloths, napkins, pillow cases, and towels can be run through this with great ease, and they are given the same finished appearance that they would acquire with hand work. Aprons, nightgowns, and shirts may also be run through this if one cares to give them a touch by hand afterwards. Undoubtedly, in the future mangles will do a great share of our ironing.

There are many small appliances that are a great help and do not cost very much. The motor for a sewing machine is the greatest help to the busy mother with lots of sewing to do. It saves work and accomplishes the same results in half the time. This motor may be used for other purposes also.

A fan is such a comfort in the hot months and a radiant heater in the cold months. These heaters serve many untold purposes—to heat the bathroom on a cold night; turned on for a few minutes in the morning one can dress in comfort in a room in which the windows have been open all night. Run it under the car for thirty minutes if the engine starts hard when it is twenty degrees below zero. My husband even used ours this winter in the barn to keep the water pipes from freezing and bursting one exceedingly cold day.

My electric curling iron is or my greatest treasures. How i better it is to spend a few mi with it than to go around in curlers all day long. If anythin titles a man to a divorce, in my i it is to see his wife running abo day with her hair wadded up in a manner. The electric curler made so that they hold a con heat and thus there is no dang burning the hair. They are inv ble for either bobbed or long ha you were not blessed with locks.

I have a toaster that was us for a wedding gift and how n many delicious golden brown p of toast it has turned forth fo breakfasts. I also have a grill t purchased when the babies tiny. At one time I used to ha get up at two in the morning kindle a fire in a wood stove to water and milk for a baby's b (I admit the baby wasn't pro trained or I never would have it.) The electric grill used fo same purpose was placed beside

THE ELECTRIC IRON NOT ONLY SAVES COUNT STEPS BUT NICER WORK CAN BE DONE WITH AS IT HOLDS A CONSTANT HEAT

bed and I could then fix the b without even getting up.

We also have a battery cha and now can charge both our r and car batteries in our baseme very little cost. And sometime do them for the neighbors.

Whenever I am away for a days and my husband has to house and wash the dishes, he al assures me on my return that next electric appliance he buys be an electric dish washer. Per we women ought to go away oft

Have you ever stopped to t of the difference alone just in the pearance of your home that ligh can make? Nothing in the w looks so cosy and inviting as a r lighted with several electric lam perhaps a floor lamp by the da port, a reading lamp upon the t and a bridge lamp beside the r It is so restful, so pleasing in ef Do not turn on the large lights in center of the room if you wish cosy effect. In the bedroom a doir lamp upon the dresser aid dressing and a bed lamp hung on head of the bed is of use every n These two lights also add to charm of the room. Strong light the kitchen and bathroom for sha help both father and mother.

At the present time a water he is upon the market that holds haps ten or fifteen gallons of water. This is built so that hea elements surround the tank and

avily insulated. By turning the at on for a half an hour in the rning the water will stay hot all y. In fact it will retain a heat thin ten degrees of the original nperature throughout the day be- ıse of its insulation. Think of the ıvenience of this for dish washing ne.

Electricity has become such an im- rtant factor upon the farm and es- cially in the farm home that the estion has ceased to be, "Can we ord electricity? It is now, "Can afford to be without it?" Within past few years we have learned t if we are to keep up with the ıes, as well as with our husbands, must employ labor saving devices every possible way. Times have nged since our great grandmoth- s day. We must keep ourselves fit, the demands are far greater upon and by keeping fit we can accom- ish far more. Our husbands use ny things to help them in their rk that their fathers did not have: loaders, milking machines, mo- s, trucks, and tractors. We must the same. Our husbands want es who can be comrades, wives of om they can be proud; they do not at tired, faded out dishrags to live h. Our children want mothers t have time to listen to their little ries, time to play with them a bit who can chum with them; not n-out, cross, impatient mothers. ı we afford to fail our men folk l our children?

n our grandmother's day each mer's wife had her hired girl. Now is impossible to get that sort of p and so we must take the offer of p that the gods have laid at our t—and that is electricity.

Why Alfalfa Fails or Succeeds

OARD'S DAIRYMAN:—County nt W. E. Spreiter of La Crosse nty, Wisconsin, made alfalfa one his major 1925 projects. In the se of the year he visited hundreds ields to investigate the causes for ure or success.

preiter found that one farmer who reported an unsatisfactory alfal- ear had sown sweet clover seed in- d of the genuine Grimm seed he ught he had purchased. One of chief causes of failure was a sour Some farmers had put on a little but not enough to neutralize the conditions. One such field had ived a two-ton lime application acre when the soils test had shown four tons were necessary.

ı another field where the plants e yellow and the stand was thin ound that no inoculation was used, none could be seen at the roots of plants. One farmer who got a poor "catch" had only sown 8 ıds of seed per acre when the rec- ıended rate was from 15 to 20 ıds. One who reported that his lfa didn't come up had mixed the with barley and sown it with a n drill. Spreiter concluded that ıd been put in too deep, so it did come up on that account. Several s were found where the new seed- had been injured by not properly ing the soil at the time of seeding. ome cases the growth was injured utting too early.

immarizing the reasons for suc- s as given by the hundreds who are ing alfalfa pay in that county, iter says, "It is best to apply the on plowed land and harrow it in- ıe surface soil a few months be- the alfalfa is seeded. The seed should be well prepared and the sown on top of the ground and ed with a harrow. On light soil the cultipacker is probably the best machine to use for that purpose as it will cover and pack the soil well around the seed and leave the surface in small ridges so it will not blow so easily. It is well to top-dress the soil with barnyard manure as that will give the young plants a quick start. Good, scarified Grimm seed gives best results. All alfalfa seed should be inoculated with fresh culture before sowing.

Wisconsin G. A. PETERSON.

Camel's friends know and demand choice tobaccos

THERE is not another body of smokers in the world like the friends of Camel. That is because Camel is unlike any other cigarette. Through experience, Camel smokers have learned the taste and fragrance of choice tobaccos and they'll have no other. They know the mildness and the mellowness that only choice tobaccos can give and they find in Camel those satisfying qualities the trained taste demands.

Tobacco enjoyment will take on a new meaning for you when you become a Camel smoker. There's a reason why Camel leads the world: it's the only cigarette in which there is so much genuine goodness.

We cordially invite you to compare Camel with any other cigarette made, regardless of price. Let your taste be the judge.

"Have a Camel!"

R. J. REYNOLDS TOBACCO COMPANY, WINSTON-SALEM, N. C.

© 1927

First Calf Heifers

HOARD'S DAIRYMAN:—In your editorial column you have asked for experience with a heifer's first calves. My milking herd averages between 25 and 30, and of this number seven are heifers' first calves. Of these seven, Kingcrest Christina Vale is our biggest milker and is out of a cow who was herself a heifer's first calf. She was the smallest, puniest, purebred Holstein calf ever born on our farm. Now she is our biggest cow. Last year, and calving within the year, she milked about 13,000 lbs. Her full sister with first calf also milked well but I hardly expect her to excel the older cow.

From another dam we have three heifers, the first two full sisters and the third a half sister. Of the full sisters, the older, which was the dam's first calf, is a bigger, stronger cow and a heavier producer. The half sister is the equal of the sister which was the dam's first calf, both of them considerably exceeding production of the heifer which was the dam's second calf. Another heifer's first calf did well with her first calf this past season. She is developing into a big strong cow and we expect her to make an excellent record this year.

As I cannot give direct comparisons in the other cases I will not mention them further. In general we feel that a heifer's first calf is not only likely to be just as good as any which follow but is likely to be above the average. I mean by this that there are likely to be some calves even of exactly the same blood which for some reason or other develop into inferior animals compared with their sisters. It is our experience, however, that the first calf will by no means be inferior but will be the equal of any of the later offspring.

Wolfboro, N. H. R. C. B.

OLMSTEAD Safe BOILERS

Sizes range from 3 to 30 H. P.

35 years record as the most economical steamer known. Do not fail to investigate the superior merits of this boiler, economical in fuel consumption, in attention and in space required. For steam or hot water for any purpose. Burns cobs, stalks, coal, or wood. Built to meet all the requirements of the different state boiler laws. Automatic damper regulator, etc. Repairs quickly and easily made by owner. Furnished with a complete equipment of fittings and fixtures. Quickly pays for itself.

The Low Cost of Railway Service

Prices of farm products are unsatisfactory; but even at present prices, a bushel, or a hundred pounds, of almost any farm product will buy more freight service from western railways than before the war.

The average price of all farm products in January, 1927, according to United States Government reports, was 37 per cent higher than in 1913—the year before the war began. Grains averaged 41 per cent higher; livestock and poultry, 36 per cent; other farm products, 35 per cent.

In the year 1926 the average freight rate of western railways was only 35 per cent higher than in 1913.

In other words, the farmer can now get, on the average, $1.37 for farm products which before the war brought him $1; and he has to pay western railways only $1.35 for freight service that before the war cost him $1.

At wholesale prices, for foods that he could buy in 1913 for $1 he must now pay $1.50; clothing, $1.67; fuel, $1.80; building materials, $1.70; household goods, $1.57.

These official figures show that the general condition of both western agriculture and western railways is mainly due to the fact that neither the prices received by the farmers nor the rates received by the western railways have increased as much in proportion as the costs of most of the things they must buy.

The return earned by the railways east of the Mississippi river in 1926 averaged 5.64 per cent on their property investment, while that of the roads west of the Mississippi averaged but 4.45 per cent, and during the last six years has averaged only 3.84 per cent.

The freight service of western railways costs the farmer relatively less than almost anything else he buys.

WESTERN RAILWAYS' COMMITTEE ON PUBLIC RELATIONS

740 Transportation Building, Chicago, Illinois

Idaho's Alfalfa Seed Industry

(Continued from page 439)

own, but most of the seed is sent directly to the warehouse "sealed in the dirt" as it comes from the threshing machine. The members are then paid on the basis of cleaned seed.

Qualifications for Growing Grimm Seed

Not every farmer can grow certified seed because they are not all willing to comply with the regulations. But just as the Land O'Lakes butter organization is demonstrating that sweet cream butter can be made, just so the Blackfoot co-operative is proving that it is possible for farmers to produce quality alfalfa seed. C. B. Ahlson, Idaho's state seed commissioner, gave us the requirements that must be met by Grimm fields to qualify for certification. They are:

1. Seed used in planting these fields must be from pedigreed origin, state tagged, and sealed.

2. Seed must be planted on clean land, that is, following sagebrush or two years cultivated crops. In case common alfalfa has been grown on land, at least four years of other crops must have been grown previous to sowing Grimm or Cossack. Two of these years must have been devoted to the raising of cultivated crops. The land must not be infested with any volunteer growth of non-pedigreed alfalfa plants.

3. The fields of Grimm or Cossack alfalfa should be approximately four rods from any field of non-pedigreed alfalfa and all such other fields on the farm must be cut for hay before there is any chance of cross fertilization.

4. The minimum distance between pedigreed alfalfa fields on one farm and non-pedigreed fields on an adjoining farm must be four rods. If both fields are on the line, a four-rod strip of the pedigreed field must be cut for hay, unless the grower of non-pedigreed alfalfa cuts his field for hay.

5. Only one variety of hardy alfalfa may be grown on the farm for seed production purposes. That is, a grower who is producing Grimm alfalfa for certification may not grow Cossack, common, or any other variety of alfalfa for seed. A grower may produce Grimm on one farm and any other kind on another but special supervision will be given at harvest time. Growers are urged to plow up and totally eradicate as soon as practical all stands of alfalfa other than the pedigreed fields of the one variety being grown for seed.

6. Ditch banks must be free from the growth of non-pedigreed alfalfa. The alfalfa on the ditch banks must be pastured or cut before it blooms, thus preventing cross fertilization.

7. Fields containing dodder or other noxious weeds or which contain an excess of sweet clover may be eliminated from certification.

Three Field Inspections Made

In addition to these safeguards, at least three inspections are made on every field. They are:

1. Seedling inspection. This inspection will be made after the grain crop or nurse crop has been removed or early in the spring of the next year for the purpose of detecting the presence of any old alfalfa plants.

2. Blossom inspection. This inspection is made the following season during the period the alfalfa is in bloom, for the purpose of determining the genuineness of the variety.

3. Weed inspection. This inspection is made for the purpose of checking on weeds in the field, principally the noxious weeds and sweet clover. This inspection may be made annually.

As most farmers know, Grimm alfalfa traces to the stock that Wende-

lin Grimm developed in Carver (ty, Minnesota. The question is times asked, "Can as hardy a of Grimm be grown under the severe climatic conditions of the where yields of six and seven bu per acre are not uncommon Minnesota, its original home, seed setting is so much more m and uncertain?" We put the question to Professor Graber. of the opinion that so long as is no mixing of the common wit Grimm we can expect as hardy from Grimm plants grown in t rigated sections of the mou states as from those grown in M sota. He said, "Hardiness in G seems to be a fixed genetic char Common alfalfa seed grown field that has stood for 30 yea Idaho in the region where Grimm alfalfa in that state is produced has winterkilled bad Wisconsin when Grimm fron same farm in Idaho sown in Wi sin adjacent to the field of co has lived through. We got simil sults with Grimm and common grown in Montana and South ta."

We Visit Seed Fields

The next day we started for ling to visit some of the Grimm fields, as very little of this se grown in the immediate vicini Blackfoot. We stopped at the of A. J. Snyder to find him an son busy mowing a nice field of There were few weeds of any ki that field and none of the no varieties. Such as were present varieties whose seeds could eas removed by the cleaning ma at the warehouse. Mr. Snyde dairyman, hog breeder, and man as well as an alfalfa seed cialist. He follows the common tice of pasturing his 125 acr pedigreed Grimm until abou 10th of June, after which it lowed to produce a seed crop. enough is cut for hay to suppl dairy herd as the sheep are f the alfalfa straw. Because th falfa straw makes such good feed, many growers keep a flo ewes the year around and fatt the young lambs on the alfalfa ture. Only a light seeding of one to three pounds per acre is This seed now all comes fro growers of short pedigree st Snyder told us that a man ca longer sow his own seed if he e to get his fields certified in the foot association because every caution is being taken to pr mixture with common.

George Line, vice-president association and the world's l producer of pedigreed Grimm just getting ready to thresh wh drove into his yard. He has than 400 acres devoted to the ing of pedigreed seed, every of which is sold through the erative. Line has been preside the Idaho Farm Bureau Federa number of years and has serv both the assembly and senate, finds time to superintend his just the same. Before the as tion was started he marketed hi without any help. He got $6,221 single load of it at Twin Falls, This is probably the biggest ever paid for one load of staple produce from an individual far told us about the weed district has just been formed. He said practically impossible for a farmer to keep his land free noxious weeds when his neig persisted in letting theirs gro the progressive farmers of

Call on "Father of Industry"

In the course of our journey through this land of ripening alfalfa fields, we came upon H. K. Wiley who is known in Idaho as the father of the Grimm alfalfa seed industry of that state. Wiley came to Idaho with the opening of the first land under the Carey Act in 1905. He had been a vegetable grower near Rocky Ford, Colorado, up until that time, but he wanted to try his hand at "pioneering," so he was one of the first to stake his claim on the dusty, sagebrush covered prairie a few miles from what is now Springfield.

When Wiley paid a visit to the experiment station at Rocky Ford in 1910 he heard about Grimm alfalfa. So well was he impressed that he ordered enough seed to sow 30 acres. He harvested his first crop in 1912, so it can be seen that this is an infant industry to say the least.

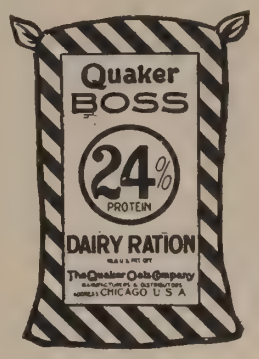
Wiley is the present secretary and treasurer of the Grimm organization. He has seen this association grow from an humble beginning of six members to the present organization that markets more than a million pounds of seed a year. The five other men who with their families belonged to the little pure-bred seed club that later grew to a state organization were A. J. Snyder, Ralph Davis, George Line, Dave Wiltamuth, and I. N. Noyer.

Ladino Clover for Pasture

Wiley had just finished threshing 15 acres of Ladino clover seed the day we saw him. This clover bids fair to become a valuable pasture crop in sections where the winters are not too severe and where plenty of moisture can be had. It certainly looked pretty on Wiley's farm but it did not fare so well on the state experiment station farm at Aberdeen. We walked through a pasture field that had carried 20 sheep to the acre all year but it was still in good condition.

Wiley told us that Carl Irwin of Twin Falls, Idaho, had been able to pasture just as many dairy cows on 3½ acres of Ladino as he could feed on 7 acres of bluegrass and white clover, although both fields were irrigated. He said a number of dairymen on the west coast of Washington and Oregon are finding it to be an ideal pasture crop. Being a luscious leguminous perennial with a good root system it has much to be said in its favor, but we doubt that it will survive the winters in most of the area covered by the two northern tiers of states.

Waukesha County Guernsey Sale



Waukesha County Guernsey breeders held their annual sale at Waukesha, Wis., March 24, selling 95 registered Guernseys to buyers from seven different states for an average price of $216. The top price of the sale, $1,000, was paid by Harry B. Cox, California, for a very good yearling son of Meadow Brook's Danny Duff from a 700-lb. dam, consigned by Larsen's Fern-Dell Farms. Emmadine Farms, New York, took the highest priced cow, a high class Glenwood consigned by D. L. Williams, for $600.

Benjamin & Heberlein did the selling with Secretary F. E. Fox in the box.

The average for cattle of the different age classes was as follows: Fourteen bulls averaged $203; 13 heifers under two years old, $135; 9 two-year-old heifers, $263; 7 three-year-old heifers, $246; 52 cows, $227.

One of these fits your herd

Use the feed that fits *your* farm, *your* herd. That's the way to maximum milk production at lowest possible cost. To give you *exactly* the feed you should have, Quaker makes a complete line, and helps you determine which you should use.

Is this it?

For example: If your cows are getting timothy hay, grass hays, straws, corn stover, or poorer grades of clover here's exactly the feed that fits your needs—Quaker Boss Dairy Ration!

or this?

If they are receiving low grade alfalfa hay, fair clover hay, or real choice mixed clover-and-grass hay, the feed for them is—Quaker Big "Q" Dairy Ration!

or this?

If your cows are getting choice clover hay, good alfalfa hay, or an excellent grade of fine mixed grass-and-clover hay, use this great feed—Quaker Dairy Ration! (Good for dry stock and young growing stock, too.)

In any case—

Whatever protein feed you use, you can profit by adopting Quaker Sugared Schumacher Feed as your carbohydrate supply. It combines ideally with any of the Quaker Dairy Rations. It may be used alone if the cows are getting liberal quantities of choice alfalfa. It's excellent for all stock—dry stock, horses, swine, sheep, steers.

All of these feeds contain molasses in dried form and are rich in the minerals which cows must have to make milk

See the Quaker Dealer near you. He has a stock of these famous Quaker Feeds—"the feeds in striped sacks"—waiting for you.

Germ-free Milk

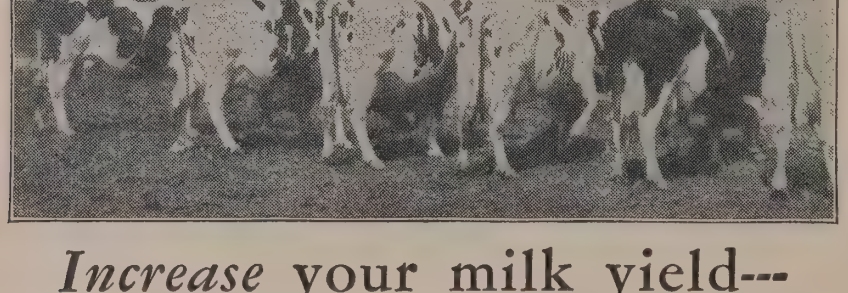
A somewhat pompous or consequential gentleman, attending a farmers' institute, alleged that he made it his practice to produce "germ-free" milk and those present let the statement go unchallenged. Probably they did not think it polite or worthwhile to take exceptions to the statement or did not give it sufficient attention to recognize its fallacy; but it was misleading and should have been explained, for we believe the speaker was alluding to raw milk and none of it is germ-free. It could be made germ-free only by perfect sterilization, and few dairy farmers are equipped to so treat raw milk.

The facts of the matter are that milk often teems with germs at the moment it is drawn from the udder. The first stream or two of milk, however, contains most of the germs and if that milk be not mixed with the bulk milk the bacterial count will be amazingly lessened. The first milk is so discarded in dairies where "certified" milk is produced and it probably would be better for every dairyman who ships milk, takes it to the condensing factory or creamery, or who has a "milk route," to catch the first milk in a separate pail and use it for feeding rather than market purposes. The germs mentioned are not necessarily dangerous to man, but they lessen the keeping qualities of milk and, on general principles, are objected to by the milk inspector. As David Harum said, "You can't always most generally tell" and so, each municipality may dictate a certain standard relative to the number of bacteria permissible in milk, on the principle that multitudes of germs indicate dirty conditions and a certain degree of danger to patrons on that account. There can, we think, be no question that a requirement of low bacterial content in market milk is wise, as it necessitates extreme care to keep the milk clean and the product being so easily contaminated and such a splendid medium for the growth of germs, it certainly cannot be too carefully handled, from cow to consumer, to make it as safe, palatable, and pure as possible. Pasteurization is not, however, a good apology for milk made under unsanitary conditions, nor do we like to think that milk must be sterilized to "make it safe for democracy."

To make milk as germ-free as possible and lessen the necessity or desirability of pasteurization or sterilization, we must begin at the fountainhead—the cow—and put into practice every act and principle of milk hygiene that is sane and possible to the average producer, without going to great trouble and expense. As the ordinary market price does not pay for the expense of producing milk strictly according to the rigorous and sometimes impractical rules of certain inspectors or commissions, the farm producer of milk can only do his best, in a sensible and practical way, to safeguard his product from contamination in the stable, milk house, cans, and bottles and wagons and be careful that the milk is drawn from tested, healthy cows by healthy, cleanly milkers. That is a "big chore," at that, and one that practically every dairyman accepts as necessary and does his utmost to undertake and accomplish in an honest and efficient way; but he cannot produce "germ-free" milk and should not be held accountable when contamination occurs, as it often does, after the milk has left his hands.

Experience With Sabadilla Powder

HOARD'S DAIRYMAN:—In your issue of March 25 you have asked for reports on powdered sabadilla seed as a louse powder. I will say that I have used sabadilla seed powder, flowers of sulphur, and sodium fluoride in equal parts for lice on horses and cattle with good results. The boys also used it for fleas on the dog and it sure put the finish to the fleas. No bad results of any kind resulted. We also use sodium fluoride for lice on poultry. The first time we used it inside the poultry house, the next morning my nose was sore. When I cleared my throat the sputum contained some blood. Now we always take the chicken outside the door; lay it on a box and dust a small amount of sodium flouride in the feathers on the breast and between the legs, and set the bird back on the roost. This has been sufficient for all lice on the bird. When the lice are bad a good clean-up of the house and a dusting of the fowls—repeating the same in three or four weeks—have always done the job for us.

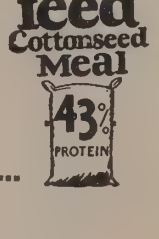


Ohio. F. J. HIGH.

Hard Milkers

Last year I had a heifer freshen with her first calf. She gave her milk very freely. This year when she freshened I could not get any milk only by stripping. Before I milked her in 10 minutes; now it takes 30 minutes. She seems to have little knots inside her teats, but they were there last year so I don't think that is the trouble. My neighbor tried tubes in the teats but it dried his cow up. I also have a cow that comes in heat every eleven days.

Turlock, Calif. R. J. D.



The growths cause the difficulty in milking. If they are located in the openings of the teats a veterinarian can remove them by operation, but if they are higher up it would be best to let a calf nurse or to dry off the

secretion of milk and fit the heifer for the butcher. It may be that the veterinarian will find it sufficient to slit down through the obstructions in four different directions with a sterilized teat bistoury but we cannot decide as to that without making an examination.

The ovaries are in a diseased condition and the womb may also be affected. Home treatment will not avail. Isolate the cow and have your veterinarian massage the ovaries and give such other treatment as he finds necessary, but there is no certainty of recovery in such a case.

Sweet Clover Poisoning

I have been feeding sweet clover hay for four years with gratifying results but lost a very valuable animal this winter which my veterinarian told me was due to sweet clover hay although our state entomologist could not find anything wrong with the hay, but stated that sweet clover produced a poison which changed the composition of the animal's blood so it would not clot and that horses or cattle so fed were liable to hemorrhage either internal or external and that it was dangerous to feed to either horses or cattle for a term of 3 or 4 weeks. Now what I want to know does sweet clover hay or pasture change the composition spoken of by our state entomologist?

Rising Sun, Md. C. A. H.

As often stated here, old or moldy sweet clover hay is dangerous as it may cause fatal hemorrhages in the tissues. Many cattle have been killed in that way. It is also dangerous to dehorn or castrate cattle that have been living on such hay as they will be likely to bleed to death. Green sweet clover has not the effect mentioned and sound hay may also be safe, but it certainly should not be made the exclusive roughage of cattle that are to be dehorned or castrated. Transfusion of the blood serum of a sound bovine animal has proved curable in some cases, but prevention is all important. Discard moldy or otherwise damaged sweet clover hay. Make the sound hay but a part of the roughage ration. Apply to the North Dakota Experiment Station at Fargo for a bulletin on this subject.

Using a Young Bull

I would appreciate your advice as to how many days' rest a thirteen months' old Holstein bull should have between services, so that he may reach maturity in good breeding form without his growth or development retarded. How old do you think a bull should be when he is first used for service?

Barneveld, N. Y. W. T. McR.

It would be better not to let the bull serve before he is 18 months old. If you must let him serve now, 5 cows will be ample and they should be bred as soon as possible but not over one service a day and per cow. After the cows have been bred let the bull be worked in harness or otherwise adequately exercised daily and feed him well on oats, bran, and oil meal in addition to hay or grass.

Mastitis

I have a good grade cow that started to give lumpy milk about a year ago. That teat cleared up, then another got bad and is now all right. Now the third is bad. She has no lumps in udder. Will she be apt to get better or worse? I mean should I dispose of her?

Brookston, Ind. F. H.

The udder is affected with chronic mastitis or garget which is caused by germs (streptococci). The disease will be likely to persist and eventually ruin the udder for normal milk production. It would be best to isolate the cow and fit her for the butcher. Cleanse, disinfect, and whitewash the stable she has occupied, including the floor and gutter.

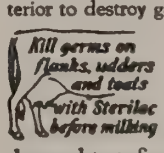
Soil Fertility and Animal Health

(Continued faom page 438)

duction and breeding require large amounts of phosphorus and calcium and unless these elements are supplied in the feed in sufficient quantities and in satisfactory form, the animal will draw upon its own system to meet this heavy drain. In many cases this demand becomes so pronounced that the breeding animal can save herself only by aborting the young and Nature apparently comes to the rescue in this manner. When nutritional problems reach this stage it is only natural to suppose that Nature's next step in assuring the survival of the individual is in the development of sterility in the breeding cow and then even avoid the necessity of abortion. Whatever the cause, it is a fact that sterility in dairy cows is very common in Western Washington.

To overcome these difficulties some producers have supplemented their feed with compounds like bone meal, lime, or rock phosphate in order to supply the necessary mineral matter and very satisfactory results have been reported.

Relief from this source, however, can, at best, be only temporary because it is pretty well established that the permanent success of the dairy industry in any section must be founded on the fact that dairy farming has cleared the way for cropping systems that justify rotations with legumes. Such crop rotations have a very beneficial influence on the maintenance of soil fertility and consequent yields. In other words, the success of the industry is based very largely not upon the direct return received from the milk produced but upon the fact that the keeping of dairy cows makes it possible to establish a system of farming that results in bigger and more profitable crops.



The findings of the Soils Department indicate that if many of the Western Washington dairy farmers who are growing and feeding little or no legume hay at present would treat their soils so that legumes would grow better, confidence in the success of the crops would be re-established and more clover or alfalfa would be grown and fed with the result that many of the present so called nutritional difficulties would disappear. That such crops can be made to grow successfully at little expense where they are a failure now, has been proven. It is true that in many cases a field examination may be necessary before definite recommendations can be made, but it would seem that in cases like this where the foundation of the whole dairy industry is frequently involved, such expense and effort is justified.

STERILAC
REG. U. S. PAT. OFF
An Ideal Disinfectant

Clean Barns
Dirt and manure teem with bacteria and mold. Remove the dirt and keep the floors, stalls, walls and ceiling clean. Apply STERILAC to all parts of the interior to destroy germs and to provide a suitable place to produce milk of low bacterial count.

Clean Cows
Wash the flanks, udders and teats first with water and then apply a solution of STERILAC to kill all bacteria. This practice is very important in the production of milk having a low bacterial count It is a reliable procedure in the production of wholesome milk.
Clean Utensils

As a further precaution keep the milk cans, strainer, pails and milking machine and separator clean. Rinse these utensils with STERILAC solution before putting milk into them. After milking scrub thoroughly all utensils with alkali and hot water and then rinse with STERILAC solution.
Clean Milking Machines
In case the milking machine is used the metal parts should be thoroughly cleaned in alkali and hot water and then cleansed in a solution of STERILAC. The rubber tubing, rubber cups and other parts of the milking machine which are difficult to clean should soak in the STERILAC solution until ready to use. It is an easy way of keeping the machine clean.

Clean Bottling Machine and Bottles
STERILAC solution is ideal for use in bottling machines. After the bottling machine is cleaned with alkali and hot water let a solution of STERILAC run through outlets to destroy germs which may be present in the corners and other interior parts of the machine. STERILAC solution will also destroy germs inside bottles.

Sterilac for Dairy Factories
Dairymen, butter, cheese and ice cream makers will find STERILAC a most satisfactory disinfectant. It destroys the germs which produce off flavors and other forms of spoilage. Use STERILAC solution in milk vats, separators and anywhere in the factory where dairy products are produced. STERILAC destroys all kinds of bacteria which spoil milk and produce disease. STERILAC kills germs—*it does* not spoil milk which comes in contact with it. That is a very good reason why STERILAC is safe to use to produce milk that is safe to serve as human food.
Ideal to Handle
STERILAC comes in powder form—will keep its strength. Sunlight does not affect it. Special introductory offer of enough STERILAC to make 60 gallons of the strength used for ordinary sanitation $1.00. Complete directions enclosed.
Send a dollar bill today.
A trial will convince you.

North Chicago, Illinois

Better Methods of Herd Improvement

(Continued from page 435)

veloped the Herd Test that every record should be recognized, regardless of whether it met a certain arbitrary standard or not. "Let us know the truth about every daughter of our herd bulls," remarked one of these breeders in an early conference and the wisdom of this principle has never been questioned. The possibility of being led astray by the records of a bull's best daughters when he may have many other daughters of very ordinary ability seemed a very important consideration to these leaders.

Recent publications from the United States Bureau of Dairying pointed out the difficulty of selecting herd sires that will just maintain production in a good herd, without even hoping to increase production. These governmental students of cattle breeding have long since recognized that the most accurate basis for studying the transmitting qualities of a sire depends upon having every daughter's record available. Supporters of the herd test are optimistic in believing that they will have a much more accurate record of the get of their herd bulls when they can see the record of each daughter year after year, without a selection that has given an opportunity to just a few of the best.

More Cows Under Test

Notwithstanding the reasonable theories underlying the herd test, it was generally believed that breeders would hesitate about exposing the actual production of every cow in their herds. But on the contrary the opportunity was welcomed. A dozen, a score, then fifty breeders lost no time in entering their cattle in the herd test.

Here was a plan for breed improvement that meant the elimination of the poorer cattle rather than the exploitation of the best. These men realized that the herd test furnished proof to neighbors, breeders, and prospective buyers that their herds were first of all practical dairy propositions, and perhaps, second, Ayrshire breeding institutions. In some cases there was made a long deferred culling of the odds and ends that almost invariably appear in the best of herds. Without exception these breeders are now glad that they removed the beasts that would have reduced their averages; and undoubtedly the breed has gained thereby.

Who Supports Herd Test?

The popularity of the herd test is well distributed through the various groups that are breeding Ayrshires. The largest number of entries are from the small farmer-breeder depending upon his cattle for a living. This group has enthusiastically received the herd test because it involves all the economic features of the cow testing association with which he is familiar, and also puts recognized records on his cattle at a minimum cost.

The larger breeding establishments are supporting the herd test because it helps them materially in their breeding problems as well as in the selling of cattle. The dam of every bull calf is given a record. Since every daughter of the bull that may be a satisfactory or unsatisfactory herd sire is tested as she freshens, evidence is quickly accumulated regarding the ability of a sire. In the first six months of the herd test several promising bulls have been brought to light, and undoubtedly still others will be discovered. Since all herd test records are made under quite similar conditions, the fairness of the comparison of different sires is quite apparent.

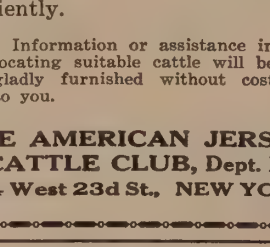
Still another group that seems quite well satisfied with the herd test are the busy men who enjoy the ownership of good cattle, and who must systematize their herds and all other interests in order to keep up with the progress of their own activities. The tabulated monthly report of the production of each cow, together with a debit or credit for feed consumed, furnishes a summary that visualizes conditions in the herds that may be only rarely observed.

Criticism of Herd Test

Of course, there are criticisms of the herd test plan. Most frequently the question is raised as to what the herd test will give that is not secured through the cow testing association. Undoubtedly there is a more careful check and a standardization of methods in herd test supervision than obtains in all states doing cow testing association work. Furthermore, the identity of thousands of pure-bred cows that have made records in local associations has been lost, while the herd test makes each individual cow's record available for the public. It would indeed be most fortunate if all cow testing association records for individual pure-breds might be recorded in some manner.

Still another criticism is a questioning of the accuracy of supervision. With a maximum of twenty cows for each supervisor in a day, and only a one-day test, the entire system has been subjected to a small degree of condemnation. Up to date there have been no unusually high records to support the contention that the system invites fraud. Good averages have been secured through consistency rather than exceptional producers. It is doubtful if it is as easy to practice deception that will increase the averages of a herd of twenty cows as to alter the record of one or two cows. With "surprise tests" the production of a herd may be checked at any time that it is considered advisable. As a matter of fact, there seems to be more consistency in the records of herds than of individual cows. But the most important reason for believing that there will be no more fraud with the herd test than with any other system of testing is the breeder himself.

Perhaps the most valid criticism of the herd test is the fact that it works a hardship on the man owning cows of proven worth as breeders, some of which may be unsound or beyond their prime. Perhaps a herd with a collection of such rare old breeding matrons should not be entered in the herd test. The progeny of such cows will always be in demand regardless of whether the herd is on test or not. But for one such cow that should be retained there are probably scores that are being unprofitably maintained and contributing very little to the advancement of the breed. Rather than attempt to define the cows that should be excused when their stablemates are in the herd test, the present rules permit no exemptions.



But notwithstanding certain limitations, the herd test is recognized as a plan that should raise the standards and also standardize the rank and file of the breed. Undoubtedly the Advanced Registry will continue to focus attention upon the high producing individual that will not receive so much glory from the herd test. On the other hand, it is reasonable to expect that the herd test will measure the value of the breed's best and also improve the lower level of the breed that should be either vealed or revealed.—Address delivered before the 55th Annual Meeting of the Wisconsin Dairymen's Association.

"If you do not have sufficient feed, reduce the number of cows or procure the feed. Remember, no man ever cheated a cow without she retaliated with heavy costs."—HIRAM SMITH.

CALIFORNIA GUERNSEY BULLS

AT AUCTION — IN WISCONSIN

BROOKMEAD'S WHITE FACE A. R.
Greatest Transmitting Sire of the Guernsey Breed

TWENTY (20) HIGH CLASS GUERNSEY BULLS from the largest Guernsey Herd in the World, Brant Rancho, Owensmouth (Los Angeles) California, will be sold by Charles L. Hill at the Sales Pavilion, Fond du Lac, Wisconsin, April 28th.

Every bull will be from a cow with an Advanced Register record. These records will all be over 500 lbs. fat, or its equivalent if made by a heifer, and the records will run up to 889.5 lbs. fat. Every bull will be guaranteed a breeder. Every bull will have an individual certificate from a U. S. Veterinarian showing that the bull is from an Accredited Herd (No. 96073.) Practically every bull will be old enough for immediate service.

Brant Rancho has the largest herd of registered Guernsey cattle in the world (350). More cows are kept on A. R. test than in any other herd (60). And provisions are now being made to put every cow on A. R. test, making the herd an Advanced Registered Herd.

Records held by Brant Rancho cows include three world's records, seven class leader records and eight California State Championship records.

1 cow holds the largest record in the West with 934.7 lbs. fat.
13 records ave. 771.8 lbs. fat (every record over 700 lbs. fat) Mature equiv. 865.1 lbs. fat.
55 records ave. 678.5 lbs. fat (every record over 600 lbs. fat) Mature equiv. 757.5 lbs. fat.
117 records ave. 625.9 lbs. fat (every record over 500 lbs. fat) Mature equiv. 696.6 lbs. fat.
141 records ave. 600.6 lbs. fat (every record over 460 lbs. fat) Mature equiv. 675.4 lbs. fat.
170 records ave. 571.6 lbs. fat (every record over 400 lbs. fat) Mature equiv. 648.6 lbs. fat.
201 records ave. 534.8 lbs. fat (only 76 reds (37.8%) class A) Mature equiv. 615.9 lbs. fat.

One bull to be sold out of former world record heifer in EE and now fourth highest in both EE and AAA with 723.32 lbs. fat in EE and 568.1 lbs. fat in AAA. Dam of another will have finished a record in AAA of over 600 lbs. fat which when verified, will make her one of the top class leaders. (Both daughters of the great Brookmead's White Face A. R. "Greatest Transmitting Sire of the Guernsey Breed." His daughters increased the records of their 500-lb. dams to 712 lbs. fat each, or more than the daughters of any other Guernsey sire.) Four bulls will be out of his high record daughters and nine will be sired by his sons. Three will be sired by Nelly's King of the Rancho A. R. One of his daughters made 707 lbs. fat at three years old and another 889.5 lbs. fat in A and she is the dam of one of the sale bulls. Another is out of Little Beauty 2nd A. R. She has made more A. R. records than any other Guernsey Cow in the world.

California Guernsey Bulls are big, strong and healthy. They are out of some of the highest producing Guernsey cows in the world. They will renew the vitality of your herd and increase your high production. Many mid-western Guernsey breeders have desired an opportunity to buy Brant Rancho bulls. Express rates seemed prohibitive. This is a chance to buy these good bulls at your own price in your own section after you have seen and inspected them yourself. Attend the sale to see these fine animals even if you do not need a bull at present.

BRANT RANCHO, Owensmouth, (Los Angeles) California

Minerals in Water Not Utilized by Cows

ilk cows do not make use of the erals contained in drinking water aining large quantities of lime a trace of phosphorus, according ecent tests conducted by the Dairy artment at the Ohio Experiment ion. This is contrary to a belief ng dairymen that hard water con- ng a large amount of lime is a nct asset.

these experiments water which distilled to make it as nearly free all mineral matter as possible substituted for well water of a y high lime content without hav- ny apparent effect on the utiliza- of lime by the cows. Likewise a ge from distilled water to well r furnishing 8 per cent of the lime intake was without effect the lime retention.

e rations were low in lime and ows were all losing this mineral their bodies. Hence it was rea- le to expect that the addition of furnished by the hard well water help to overcome the losses.

e type of water had no noticeable on the utilization of either lime nosphorus which is also often g in the dairy ration. However, horus occurs only in small nts in well water generally and e water used in these experi- only a trace was found.

ps grown in limestone regions lime land contain more lime those grown on acid soil, and in limestone regions has a larg- ie content. The lime in plants lized by dairy cows, that in the is not utilized by them.—Week- ess Bulletin, Ohio Experiment n.

he Dehorned Ayrshire

take the following from the British Agriculturist, published nburgh, Scotland:

lking the bull by the horns" is a ld and suggestive saying, but vidently to apply no longer in mous Ayrshire herd. Mr. A. ntgomerie, Lessnessock, Ochil- as decided that all calves born herd in future are to be de- at birth. Mr. Montgomerie has studied the question from nts of view, and hence his de- that "the advantages to be de- from a dehorned animal far gh the other." It is always re- g to find a man giving practi- of of having the courage of his ions, and Mr. Montgomerie is this now, whether his convic- e wise or otherwise.

n the purely utilitarian point iv, Mr. Montgomerie's decision t be questioned. The horn of Arshire, as of the "Highlander," oubt a potentially dangerous ient. The remark applies also ny other distinctive cattle but one cannot help thinking there was to be a policy of de- all round, a very great deal picturesqueness of farm animal uld pass from us. That, how- a purely sentimental consider- but, coming to the business will not be denied that if Ayr- Shorthorns, Highlanders, and are to come into the show ehorned, the conscientious ill have a worrying time of it. the "poll" of the Aberdeen- must be carefully scrutinized ating breed character, so the often eloquently suggestive of haracter and quality when the breeds come to be judged. ll certainly be interesting to ther the new vogue is to be- pular, but there will be some who would prefer that in breeding animals, at any rate, nature should be spared such revolutionary liberties. Horns on cattle may be dangerous, but so are the teeth, and the heels of the horse.

French Canadian Cattle Breeders Meet

At the thirty-fifth annual meeting of the French Canadian Cattle Breeders' Association held Feb. 22, at Sherbrooke, Quebec, 150 of the 373 members of the organization were in attendance. The officers' reports showed an increase of 27% in membership, an increase of over 65% in registrations (727 animals were registered in 1926), and an increase of over 45% in transfers. Official testing also showed a decided increase, too, 4 bulls and 118 cows being entered in the Register of Performance in 1926 against 98 in 1925.

The officers elected for 1927 are Dr. Gustave Langelier, president; Ernest Sylvestre, vice-president; Adrien Morin, secretary.

AYRSHIRE CATTLE AND BERKSHIRE HOG BREEDERS

Ask Me Another

1. What breed of dairy cattle is noted for its heavy production of four per cent milk?
2. What breed of dairy cattle has no equal in beauty?
3. In what breed of dairy cattle can a farmer get the most for his money?
4. What is the best and quickest method of improving a herd of ordinary cattle?
5. What Association enjoys furnishing you with information about its breed and will assist you in locating foundation animals?

Answers— 1st, The Ayrshire.
2nd, Everybody knows this one.
3rd, The Ayrshire is the Scotchman's favorite.
4th, By the purchase of an Ayrshire bull.
5th, The Ayrshire Breeders' Association, 10 Center Street, Brandon, Vermont.

BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds
Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.
We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

There is Only One "Sir Inka May 2nd" and You Can Start Using Him On Your Herd Right Now

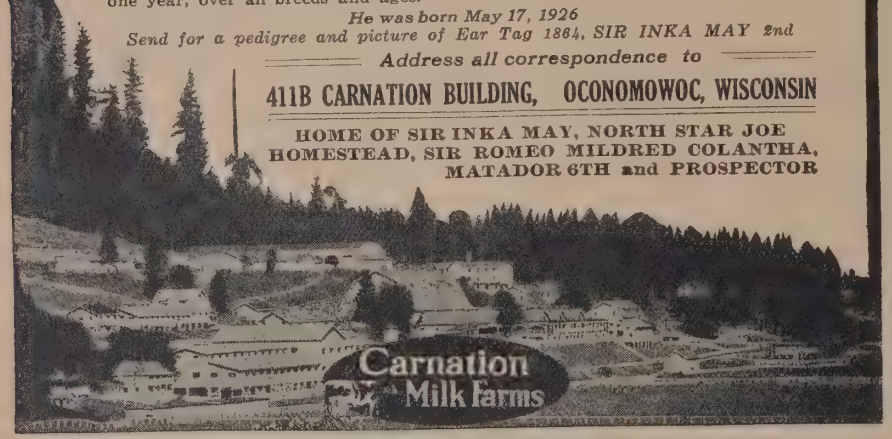
There is only one Sir Inka May 2nd—and this is the bull:—a long bodied, straight topped, beautifully marked son of Sir Inka May and (THINK OF IT) out of one of our most noted show cows. Furthermore, he is ready for you to start using at once.

Owning a son of Sir Inka May will bring considerable attention to your herd, but owning this particular son of Sir Inka May out of Tillamook Lola May De Kol will give you a herd sire that you can indeed be proud of. His dam was second prize aged cow at the 1922 Pacific International and is a full sister to the National Grand Champion, Tillamook Daisy Butter King De Kol.

You'd expect outstanding individuality with this combination, and that is just what you get in this bull.

His dam (a 29-pound cow with 895 pounds of butter in a year) has a 25-pound 3-year-old daughter.

His sire is from the Champion butter producing cow of the United States for one year, over all breeds and ages.



He was born May 17, 1926

Send for a pedigree and picture of Ear Tag 1864, SIR INKA MAY 2nd

HEALTHY HOLSTEINS

In the development of a herd of pure-bred animals, nothing can be more important than health. Many breeders, overlooking this fact, have spent years of time and effort building herds and later have found them badly diseased.

Michigan State Herds have been tested regularly for tuberculosis for years.

The last test included 1708 animals and only three animals were found slightly infected in two of the herds.

Dependable producing Holsteins since 1889

Wonderful New Method

Milks Cows Like No Other Machine Ever Milked Cows Before

AT LAST something *new* has happened in the history of machine milking!

For 15 years milking machine makers have been bringing out new models—telling of the grand improvements they have made—BUT when all was said and done, it proved to be mostly talk, which didn't mean a thing to the farmer.

Now—the Pine Tree Milking Machine Company has brought out something *really* new.

The wonderful SURGE Milker has changed all old ideas of what a milking machine ought to accomplish. You cannot judge this machine by anything you ever knew of milking machines in the past. Breeders who used to be afraid to put a machine on their record making pure breds are using the SURGE. They tell us they making wonderful records—and the udders have never been k in better condition by the most careful hand milking.

Dairymen producing for city milk trade who couldn't make pu clean milk with old type machines are earning premiums for low b teria count—and spend no more time washing the SURGE th they used to spend washing milk pails.

The SURGE is sweeping everything before it. It is the great thing that has happened in the dairy industry for many years.

Send the coupon below for details of our surprising offer that gi you a chance to prove out these things for yourself before y obligate yourself to buy a thing.

Only 4 of These Rubbers To Wash

Think of that! You men who have tried so hard to keep old "Long Tube" milkers clean—and couldn't get by with it. Only these four simple pieces of rubber to wash. No long tubes. No claws. No places for milk to lodge and breed bacteria. Milk travels only 4 inches from teat to pail.

Another thing! You take the machine all apart for washing in 20 seconds. No tools needed. And you put it all together ready for use in half a minute. If you have ever handled a milking machine, you know what this means. The one old objection to milking machines is wiped off the slate. Any man can make a grade of milk equal to Certified standards with the Surge.

The Surge Milker
Pine Tree Milking Machine C

Why Do We Call It the "SURGE"?

You will know at once when you see it work. That surging action—back and forth, gets the milk as no milker ever got it before. Cows that would never give down their milk to a machine, milk out DRY with this wonder milker. It sucks from the front, just like a calf. It gets the strippings as no machine ever got them. For two years it has been milking a herd of freak cows that we got together to put this machine to the most difficult test that any milker ever had to meet.

Mail Coupon for FREE Demonstration OFFER

You've been reading here the most surprising statements you have ever read abou milking machine. But you will never believe them as we believe them until you see t wonder milker working in your own barn, on your own cows. That's why we are rea to offer you a chance to have a FREE demonstration without obligating yourself to b anything. We want you to see the Surge Milker milk out a cow that you are ready bet can't be milked by machine. We want you to take the machine apart and wa it, *yourself*. Just to see how quick and easy it's done.

Once you see these things for yourself, we don't have to spend any time trying to "Sell" you an outfit. You'll never let us take it out of your barn. But we're taking the chance of that—not you. Our FREE demonstration offer leaves you open to do exactly what you want to do. It is the most surprising offer ever made in milking machine history. Send today for full details.

Easy Terms

Any man who wants to buy a Pine Tree Sur Outfit after our free demonstration, can make deal to pay for it on very easy terms. We'll figu with you to keep the cost down by using any equi ment you may have already installed in your bar You'll be surprised how little it will amount t Fill in the coupon and mail it right now. It doesn obligate you to do a thing but listen to the propo tion we have ready to make you. Mail the coup at once.

olume 72, No. 9 Fort Atkinson, Wisconsin May 10, 1927

You will appreciate this new De Laval feature

The Turnable Supply Can

Separator users who have seen and tried the new 1927 De Lavals are pleased with the turnable supply can — it is so handy and convenient. The supply can may be turned so that tinware and bowl can be put in place or removed, even though the supply can is filled with milk. This is just one of a number of new features on the 1927 Series De Laval Separators, which are everywhere being praised as the best separators ever made. Other features are:

2. Easier Turning: For three years the De Laval experimental and engineering departments have been conducting extensive tests to develop still easier turning separators. The results of these tests are embodied in this new series, which both start and turn easier than any other machines.

3. Oil Window: The new oil window enables you to see at all times the level and condition of the oil. It shows at a glance whether or not the separator is being properly oiled.

4. Floating Bowl: All new De Lavals have the wonderful "floating bowl," now used in De Laval Separators with such splendid results. It is self-balancing, runs smoothly without vibration, with the least power and wear, skims cleaner and delivers a richer, smoother cream.

You can't afford to use any other separator, because the new De Lavals skim cleaner, are easier to handle and operate, are more convenient, and soon pay for themselves. Trade in your old separator as partial payment. Sold on easy terms. See your De Laval Agent or write nearest De Laval office for full information.

COMMON SENSE IN NEW ENGLAND DAIRYING

GEORGE M. ROMMEL, NEW YORK

THE Turner Centre System, one of the largest distributors of milk and ice cream in New ngland, is a most interesting adven- ıre of farmers in the co-operative wnership and management of their ısiness.

Dairy authorities cite Turner Cen- e as a model dairy institution. In ants and equipment there is little be desired. Buildings, machinery, rses, wagons are of the best and e kept in first-class condition.

Co-operative enthusiasts hold up ırner Centre as a brilliant example what farmers can do in co-opera- on with each other and with busi- ess men. But both dairy experts ıd co-operative partisans got a jolt ıen a permanent break threatened st summer between the Turner ntre System and the New England ilk Producers' Association—NEM- A for short—the leading dairy pro- ıcers' sales agency in New England. hen the basis of the trouble was scovered to lie in one ugly word— ismanagement—people who did not ow the facts jumped to the con- usion that the farmer wners were responsible r this condition of af- irs. That is not true, you shall see. Pardon little history.

Some five years ago e bright idea occurred men interested in urner Centre that it ould be a fine thing if e farmer patrons of e company should adually buy it and in me own it outright and responsible for the nduct of its business. here was no "nigger in e woodpile," no inten- on to sell the farmers gold brick or to unload ı them a good proper- for more than it was orth. It was a straight, o-sided business prop- ition. An issue of "co- perative common ock" was arranged hich patrons were to y over a period of five ars, at the end of hich time they would the bona fide owners the company. To make re that all would run oothly, the old man- gement, which had ilt Turner Centre om the ground up into e fine property that it as and still is, agreed remain in charge until e farmer buyers had ade the last payment their co-operative mmon stock.

It happened that there- lay the weak point of is otherwise sound and r-sighted conception. The promoters overlooked the fact that managers and boards of directors are not infallible, but just as human as other folks and sometimes inclined to make mistakes, as other people do.

Farmer ownership did not become an actual fact until February 1, 1926, and long before that the damage had been done. The company had for years been increasing its ice cream and city milk business, and the future looked so promising that quite an ambitious expansion program was adopted. It did not pan out in real good paydirt; very like overexpansion elsewhere. Then, with plants in Boston, Providence, and other New England cities, the directors continued to keep the working headquarters of the business in the little town of Auburn, Maine, where they had always been. And Auburn is some 200 odd miles from Boston where a large part of the company's products are sold. Boston competitors gave Turner Centre one trimming after another under this handicap, but the habits of a Maine man are hard to change, and Turner Centre stuck to Auburn.

While there were other things that showed more sot-in-the-wayness than good business judgment in management, the financial policy amazes one who knows something of the tenacity with which a New Englander cleaves to a dollar. In 1924 the company paid out of earnings dividends to the amount of $118,042.89, and added $59,954.88 to its surplus—not much profit on more than six million dollars' worth of business but still a profit. The surplus then stood at $264,131.23 on December 31, 1924. In 1925 only $18,047.45 was available as surplus at the end of the year, and the surplus fund had been depleted until it stood at $207,399.20 on December 31, 1925, including the item just mentioned. No dividend had been earned, but the directors paid one anyway—$112,660.98—out of the surplus, leaving that somewhat bruised and battered item of the treasury at $94,738.22.

When the farmer patrons became full owners on February 1, 1926, the first thing they had to face was the treasurer's report. In power at last, they elected their own board of directors who appointed a new general manager, Weston B. Haskell, who had grown up in the Turner Centre System.

Haskell's first move was to arrange to spend five days a week at the Charleston plant in Boston, thus, in effect, moving his headquarters to the Hub, and before he got through with the reorganization there was a new manager at every Turner Centre plant but one.

Then, on top of other troubles, 1926 was a poor ice cream year in Turner Centre territory, and the new management faced the problem of keeping going with a deficit. This brought on their clash with the New England Milk Producers' Association. NEMPA includes in its membership most of the farmers who produce milk for the Boston market, and about 80 per cent of Boston's milk comes from their farms. The association publishes the price for milk in advance, as such organizations do elsewhere, and the dealers who get their supplies from NEMPA producers pay the "known" NEMPA price, Turner Centre among them.

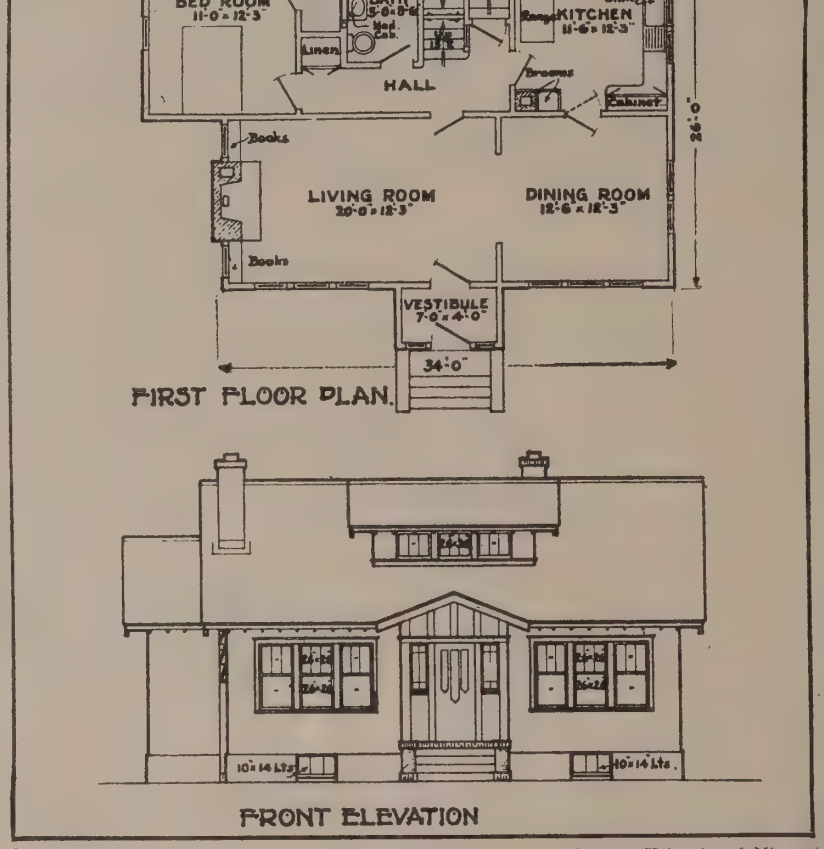
Faced with a critical financial situation, the Turner Centre directors could not see that passing dividends would meet the emergency. There was not likely to be enough earned to provide for dividends and there was even grave danger that expenses would exceed receipts. So the directors took the bull by the horns and announced that, beginning with August, they would not pay the NEMPA prices for milk, but would do as well as they could by their producers, hoping, if business was good, to make up the difference later on, perhaps paying better than the NEMPA scale in time.

That set off the fireworks. If one big dealer (and Turner Centre is a dealer, for all it is farmer-owned) refused to abide by the NEMPA scale, the entire structure which the New England dairymen had so laboriously built up

(Continued on page 534)

THE WAY TO BALANCE FARMING

THE FARM HOME FOR LIVING



H. B. WHITE, MINNESOTA

THE farm home is not only the home of the farmer and his family but it is the factory for his farm business where he transforms his hay, grains, etc., into more easily marketed products such as pork, beef, milk, butter, and eggs.

Under pioneer conditions the farmer usually gave the major portion of his time and effort to clearing and developing his fields so as to enlarge his business. In many cases he gave too little attention to the arrangement of his farmstead and the location and planning of his farm buildings. In order that the farm home may be developed into a convenient and attractive place it is necessary that the farmstead as a whole be given careful consideration so that there will be suitable space for buildings which may not be erected until some years later. Figure 3 shows a farm home with modern buildings and up to date equipment. It is a real home.

Although the farmhouse is the most important building it has been developed very slowly. In its simple form it is a rectangular building in one end of which is the kitchen, the middle serves as a living and dining room, while the other end serves as a bedroom. As a house may be planned only once by each generation, there is not very much information passed on from one generation to the next. It is perhaps due in part to the influence of the automobile which broadens the view of farm people that more conveniences are now considered necessities which were a few years ago thought of as luxuries. The farmhouse of the successful farmer is now easily made modern with its water supply operated by windmill, gas engine, or electric motor, its septic tank, its heating plant in the basement, and its lighting plant which does so much to make living conditions satisfactory. With the modern conveniences to be installed in the house, the structure is more complicated and requires that more care be given to its planning in order that economy and convenience will be secured. Figure 2 shows a farmhouse that is a source of great satisfaction to the owner. It adds to the value of all the farm property in the community.

A house has so many different points to be considered in making it suitable for each family and the particular site which it is to occupy that numberless plans of farmhouses have been prepared and are now available. Some are especially suitable to face east, some will face north, etc. No one plan will be suitable everywhere. In order that a satisfactory home may be developed it is necessary that careful thought be given to the requirements and a house plan selected that will most nearly meet the requirements. It is often said that each time one builds he will build differently. This is very true as the conditions will have changed in the meantime and necessitate different arrangements.

—Courtesy University of Minnesota

FIG. 1—PLAN OF A ONE AND ONE-HALF STORY FARMHOUSE

The farmhouse should be given the most important part of the farmstead. It is desirable that it be high enough so that there can be drainage from the basement. The grove and plantings should serve as a frame or background with the house as the important feature of the picture.

A farmhouse may not be erected all at one time. In Figure 1 is shown a plan of a house of which a part only may be built. It may be built to include the kitchen and stairway at the rear and a living room and small bedroom at the front. This same house may be enlarged or built so as to include the kitchen, stairs, and bathroom at the rear and a large combined living and dining room and a bedroom at the front. If the house is built complete as shown it makes a splendid farm home. The kitchen is large enough to permit of the operations that are necessary. In addition there is a convenient basement which is reached through a grade door. This permits of going directly to the basement from outside without climbing to the level of the first floor.

The stairs to the second floor go up from the hall and land near the middle of the house where the three bedrooms are easily reached. The bathroom and first floor bedroom are very comfortable and convenient. They save many trips up and down stairs if there are small children in the family.

The dining room is planned so that with the house facing south or east the morning sun will light up this part of the house.

The front door of the farmhouse is one of the problems that has not been improved to suit changing conditions. It is important that it be reached by the visitor driving up in an auto. This means that the old habit of driving a team back near the barn to hitch it must be overcome and the driveway pass near enough the front door so that visitors may leave their car and enter through the front door instead of through the kitchen door.

Although the basement is not shown it is made up with masonry walls and convenient grade door. It is easily reached and will be used a great deal more than were the old time cellars. The basement serves as the location for the heating and lighting plants as well as a storage space for fuel, fruit, and vegetables. In many cases the laundry room is located in the basement. It also serves as a cool working space in summer and a warm place in which to work in winter.

The farm home is more than just a house in an attractive farmstead. It may be more helpful to consider that the finer farm homes are the result of planning and working of the whole family for a suitable home. The details of arrangement are only minor items in the carrying out of the plan for a satisfactory home. This broad viewpoint should be kept in mind even while working on the details of arrangement, utility, and beauty. It should, however, serve as an incentive to make one give more consideration to the far reaching effect of results that may be secured by carefully made plans.

The modern flat and duplex of the city have many features that appeal to the young people of this generation who are frequently changing their location and occupations, but it is very doubtful if the next generation growing up under these methods of home keeping will show the characteristics that have made the sturdy home-making pioneers of America so highly respected and loved.

The homes of these pioneers were almost entirely farm homes in which the whole family worked hard to supply the food and shelter that are so necessary in a new country. Each member of the family had some part in the daily routine of the home work and early learned to do those tasks with regularity and faithfulness. This training is not now a part of the city boy's or girl's early experience and there is grave doubt as to the future success of a young person without such training. The farm home still requires the attention of all the family in its operation and thus is given the training that has so well led t

Convenience, Beauty, Contentment

HOW GOOD DAIRY BARNS ARE BUILT

IN order to be in a position to select the type of building construction, materials, labor, and feed saving devices best suited to his needs and pocketbook, the prospective builder should get all the suggestions and help available on the subject and study them carefully. Bulletins from agricultural experiment stations, and literature from companies manufacturing stable equipment, ventilating systems, etc., should be secured.

Of course, one of the first things to consider is the floor plan in order to determine the size of building that will be required to house the herd. It is folly to attempt building without a definite plan showing the layout and size of stalls, pens, feed rooms, walks, and alleys so the barn will not be too large or too small, but just right. Without an accurate plan, supporting posts, doors, silos, etc., cannot be located correctly and trouble will develop later when completing the stable.

Doors must be properly located so that they will come at the correct place for silos, walks, and milk house. Too often it is found that doors have been located in the wrong place and have to be moved simply because enough consideration was not given to the plan before starting the work.

The Foundation

A good barn must have a substantial foundation; if it is skimped and carelessly put in, the walls will settle and crack. Usually two to two and a half feet is sufficiently deep. It is not necessary to carry it below frost line, but it should never be placed upon loose or refilled ground. The usual practice is to figure that earth or clay in natural beds will safely sustain from three to four tons per square foot without settling. In view of this a footing for a post carrying six to eight tons should be twenty-four inches square and at least twelve inches deep. It is sometimes necessary to make them deeper in order to get down to good bearing soil. Footings for foundation walls are ordinarily from twenty to twenty-four inches in width and ten to twelve inches deep.

Concrete and stone are the two common materials used for foundations below ground. A good mixture for concrete is 1:2½:5, meaning one part Portland cement, two and one-half parts sand, and five parts broken stone or coarse gravel. Large stones are sometimes used and the concrete mixture used to fill the space between them. When this kind of foundation is used, care must be taken to work the cement until all the spaces between the stones are filled.

The Stable Wall

The construction to use for stable walls from floor line to second story joists is a question very often difficult to decide. Local conditions have considerable bearing upon the material available for this work at a reasonable cost.

The requirements are for a wall construction that is warm and durable, that will conserve the stable heat and keep out the cold. To get maximum results along this line, the walls should be insulated in some way so that there is no direct connection between the cold air on the outside surface of the wall and the warm air of the stable on the inner surface. In general, very little attention has been paid to building walls of this kind, with the result that a large proportion of the dairy barns have frost and moisture on the walls in cold weather.

A dead air space in the wall makes a very effective insulation. However, it must be dead to give satisfactory results, that is, there must be no leakage of any consequence or its efficiency will be materially reduced. The aim, then, must be to so build the wall that the air space will be tight or, in other words, dead. There are several ways of arriving at the desired results, it depending upon the material to be used and whether the wall is to be built new or is existing.

Concrete, stone, and brick can be built with air space in the wall in new work. Existing walls can be insulated by furring the inner surface and sheathing with dressed and matched lumber or by lath and cement plaster. Good results are also obtained by lining the inside of wall with a thin wall of hollow tile.

Wood walls should be boarded on the inside and outside of studding. This forms a dead air space, but due to shrinkage of lumber it does not remain effective for any great length of time. With this type of construction, it is advisable to use at least ½" thickness of special insulating material, of which there are several reliable makes on the market. This insulating material comes in sheets or rolls and can be placed between the studding or nailed directly to them and the inner sheathing applied over it. When placed between the studding it should be flanged at edges and fastened with wooden strips nailed over to make the job tight.

Wood walls should have a base of concrete, stone, brick, or tile at least 12" above floor line to protect the wood from moisture. Wood walls have the disadvantage that they are not as durable as concrete, stone, brick, or tile. They depreciate faster and require occasional painting.

Hollow clay tile for dairy barn wall construction is rapidly growing in popular favor. It makes a warm, dry wall, as the hollow air spaces in the tile provide the desired insulation. This wall material is strong and durable and does not require painting. The tile units can be obtained in a variety of finishes and colors and, if desired, the surface can be plastered with cement mortar.

A type of construction extensively used is to build the concrete or masonry wall up to the under side of windows and continue with wood. The advantages of this method are that the wood wall provides ideal conditions for building in the fresh air intakes of the ventilating system. With the large number of windows in the modern dairy barn, the expense of form work alone for the small amount of concrete wall between the windows would almost build the wood wall, and the labor of building small masonry piers between windows is costly.

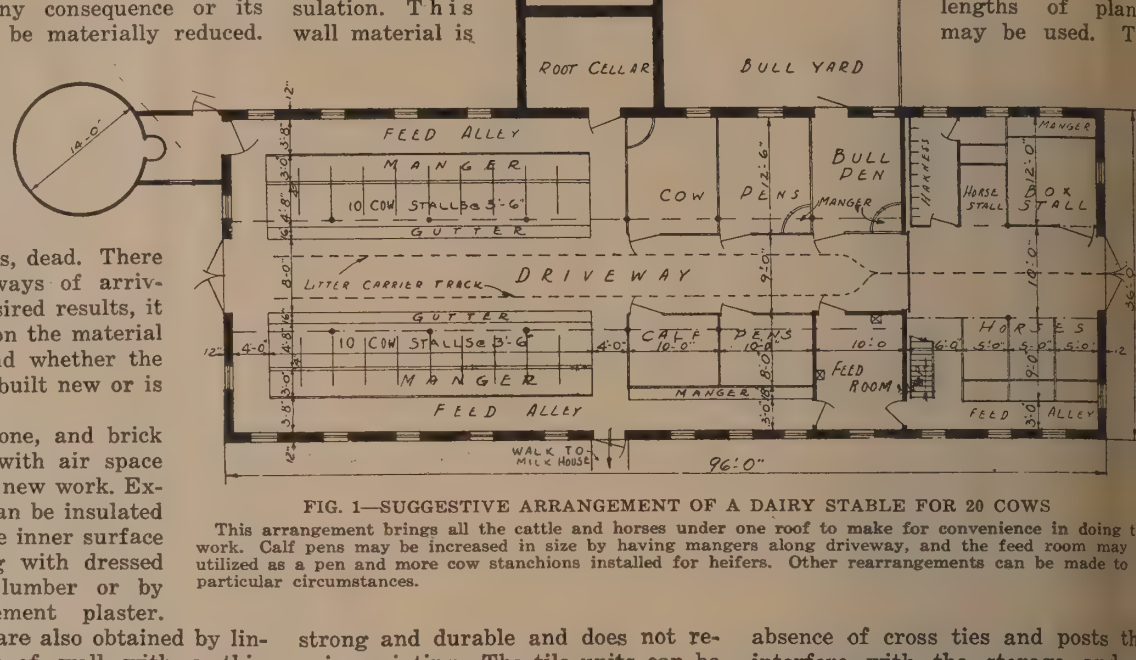

FIG. 1—SUGGESTIVE ARRANGEMENT OF A DAIRY STABLE FOR 20 COWS

This arrangement brings all the cattle and horses under one roof to make for convenience in doing t work. Calf pens may be increased in size by having mangers along driveway, and the feed room may utilized as a pen and more cow stanchions installed for heifers. Other rearrangements can be made to particular circumstances.

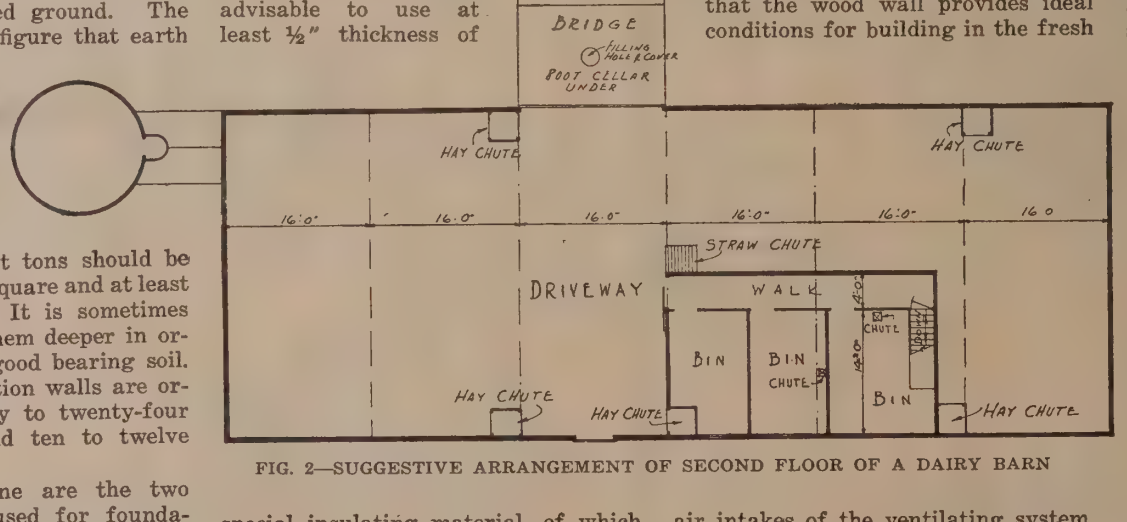

FIG. 2—SUGGESTIVE ARRANGEMENT OF SECOND FLOOR OF A DAIRY BARN

Types of Framing

The old style timber frame barn with heavy cross beams has been largely superseded by oth types of construction such as illu trated in figures 4, 5, and 6. The newer types of construction perm the use of two-inch plank in place heavy timber Shorter stoc lengths of plan may be used. T absence of cross ties and posts th interfere with the storage and r moval of hay are much appreciate

These newer types of framing ha been in use for many years and ha demonstrated conclusively that th are not only cheaper to build, b they are fully as strong as the old timber frame barns. Thousands these barns have been built and ha stood solidly through severe wi storms and heavy snows. They ne to be properly designed and bu but this is easily done by any ca penter or handy mechanic w will follow plans and specificatio that are readily available.

Timber cut from the farm wo lot can be used, for a portable s mill will saw the logs into plan proper size and thickness just readily as for large timbers. T lumber should be allowed to seas before using and care must be ta en to use good, sound, tough lu ber for the heavy bearing portio of the frame.

Admit the Sunlight

There should be an abundance windows to admit sunlight, wh is an important factor in keeping barn dry and the cows healthy. Su light is a powerful disinfectant. P vide not less than four square feet glass for each full grown animal a make the windows as long as prac cal up and down, as this gives a b ter distribution of sunlight.

Windows should be fitted w storm sash or the sash should be d ble glazed. The double glazed sash built by using two panes of gla leaving one-half inch air space tween. The reason for this is to c serve heat and prevent windo from becoming covered with fr and ice which shuts out the sunli that the windows are supposed to in. The sunlight is wanted in barn in winter, not in summer, any amount of barns have windo covered with a thick layer of fr and ice from the beginning to end winter. This frost and ice makes barn damp and unhealthy.

Good window construction provi insulation for the same reason t walls are insulated. Glass allows h to be conducted through it very rel ily and with the large amount glass in the modern dairy sta

(Continued on page 535)

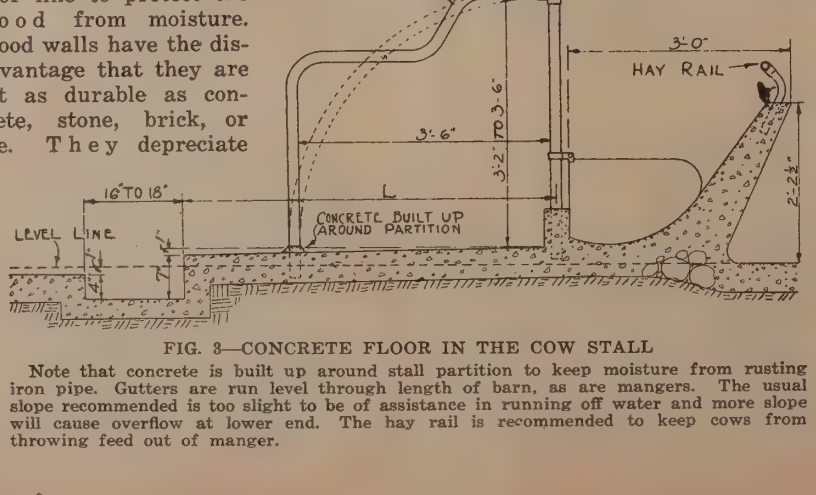

FIG. 3—CONCRETE FLOOR IN THE COW STALL

Note that concrete is built up around stall partition to keep moisture from rusting iron pipe. Gutters are run level through length of barn, as are mangers. The usual slope recommended is too slight to be of assistance in running off water and more slope will cause overflow at lower end. The hay rail is recommended to keep cows from throwing feed out of manger.

THE VENTILATION OF DAIRY BARNS

Well ventilated stables that provide pure, fresh air and that are comfortably warm and dry in winter are equally as important to insure comfort as are feed and water."—Professor George C. Humphrey of Wisconsin.

In these few words Professor Geo. C. Humphrey of Wisconsin, advocates the case for ventilation, which is merely the process of securing uniform circulation and keeping the barn supplied with proper air for breathing. It is accomplished by allowing fresh air to enter the barn without draft and foul air to leave the barn.

In order to produce the largest quantity of milk with the greatest economy, the cow requires a reasonably warm stable in winter, the preferred temperature being between 45 and 50 degrees. A tightly built and properly insulated stable will do this but the cow needs more than this. She needs fresh air to supply her with oxygen and dry air sufficiently dry to allow her vital processes to be carried on without too great a handicap. Unventilated stables not only do not supply the cow with fresh air but the stable is likely to be damp. This is bad for the cows and will cause the rusting of steel equipment, the rotting of wooden timbers and the molding of feed.

Why Fresh Air

A cow inhales approximately 224 lbs. of air in 24 hours, or about 1/12 the weight of the feed and water she consumes. The air contains oxygen, which is necessary for digestion and assimilation of feed as it is necessary for the burning of fuel. In both cases the process is known as "combustion" or burning. The feed "burns" (digests) and she needs large quantities of oxygen to do this properly. In breathing in air the lungs of the cow absorb oxygen into the blood and the air breathed out contains a greater proportion of carbon dioxide and more moisture. In 24 hours a cow will exhale 12 to 18 lbs. of moisture and a somewhat smaller amount of carbon dioxide. Don't jump to the conclusion that carbon dioxide is poisonous as it is of itself like the gas from the exhaust of a gasoline engine. This latter gas is carbon monoxide and is very poisonous. However, the constant rebreathing of air exhausts the oxygen and puts a heavier load on the vitality of the cow in securing sufficient oxygen to purify her blood. The effect of this extra load is not often apparent until the damage is done.

The lack of oxygen may result in a weakened constitution, temporary physical depression, fatigue, and in general less vitality to resist disease and the common ailments. Disease germs introduced into the blood are destroyed by the oxygen carried from the lungs by the red blood corpuscles, hence the importance of supplying plenty of oxygen by means of ventilation.

What Controls Ventilation

Warm surfaces of the animal's body and the colder air surrounding them cause an upward movement of air where the animals stand. By the same law of nature, the exterior walls being colder than the air in the room creates a movement of air down the outer walls, thus setting up a circulation within the room.

Besides the movement of air, the amount of moisture it contains is important. The warmer the air the more moisture it will hold. When cold air is brought into the barn and warms up, it will absorb moisture resulting from the breathing of animals and the manure. It is one of the purposes of ventilation to take out this moisture by means of allowing free passage for the foul air to escape.

Circulation is important, but an exchange of foul, moist air for fresh air is very necessary. This exchange is brought about in a gravity system of ventilation by applying the laws of nature.

When the air is heated by the cow's body it expands and due to this expansion it is forced out of the barn if there is an outlet. The greater the difference in temperature between the inside and outside of the building. the more rapid the movement of air up and out through the outlet. The movement of air through the outlet is also influenced by the wind passing over the upper end of the flue.

The intake opening on the outside of the building should always be lower than the upper end of the outtake flues. The greater this distance, the more constant and uniform exchange of air will be.

Intakes that permit back-drafting reduce the efficiency of more ventilating systems than almost any other one factor. Back-drafting through the intakes can be largely overcome by having the outside openings of the intakes near the bottom of the wall, or installing intakes with automatic dampers that permit the air to enter but not leave the barn through the intake flues.

Construction of the barn is also important. If the walls are thin or poorly insulated, they radiate heat, and this heat cannot be used to set up a difference in temperature that makes the ventilating system circulate the air. A warm wall and tight doors are needed in cold climates if the best results are to be secured from ventilation and the stable kept warm. There are many barns in which a well designed ventilating system fails to create a proper condition because the stable is too cold, due to a lack of proper insulation and windows and doors that are loose and drafty.

Different Systems

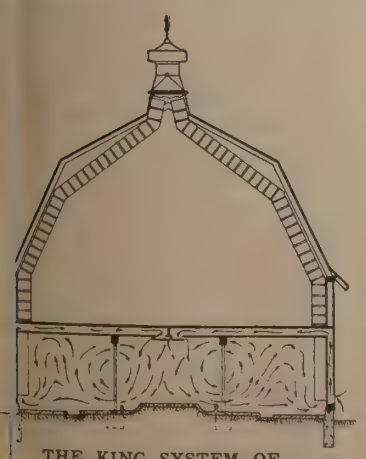
The King system, or the principle of ventilation as outlined by Professor King at the University of Wisconsin, provides for a number of small intake flues and one or more large outtake flues. Fresh air enters the intakes above the sills, rises between the studding, and enters the stable at the ceiling. The outtake flues start near the door, pass upward inside the stable, through the mow and under the roof, and finally out of the ventilator, which is usually located on the ridge of the roof. The total area of a cross section of the intake is usually somewhat less than the cross section area of the outtakes. Under average conditions it is figured that each cow requires approximately 34 square inches of area in the outtake flue, but this, of course, is varied by the warmth of the stable, the height of the outtake flue, and the location of the building.

The Rutherford System, which is one of the oldest of the present systems of ventilation and is largely used in Canada, delivers the fresh air through the inlet flues a little above the floor level, turns downward, and enters the stable at the floor level. The outlet flues start at the ceiling of the stable, and their total area is approximately twice that of the inlet. The recommended outtake area per cow is less than in the King system, the reason for this being that the Rutherford system is largely based on weather conditions existing in Canada.

The modified King system retains the intakes at the ceiling and also removes the foul air from the ceiling, as in the Rutherford system.

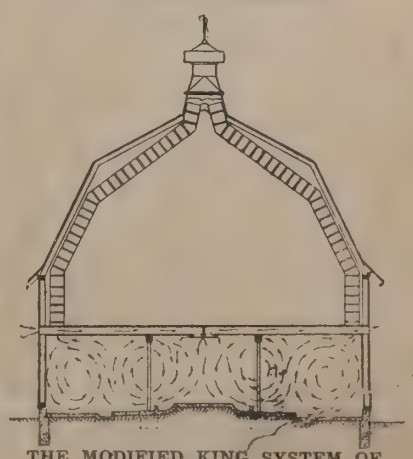
Construction Details

A further variation in ventilating systems has come into increasing use during the past two or three years. Both the intakes and the outtakes may be placed on the outer walls of the stable without regard as to which way the cows face or the type of system installed. This method permits the placing of the outtake flues where they are most out of the way and does away with the objection of having either the intake or outtake at the middle of the stable. The outlet flue will not draw air for more than the diameter of the flue below its lower end. Tests have shown that this method of installation does not cause a short circuit of air from inlet to outlet, but on the contrary it diffuses the air in a uniform manner throughout the entire building.

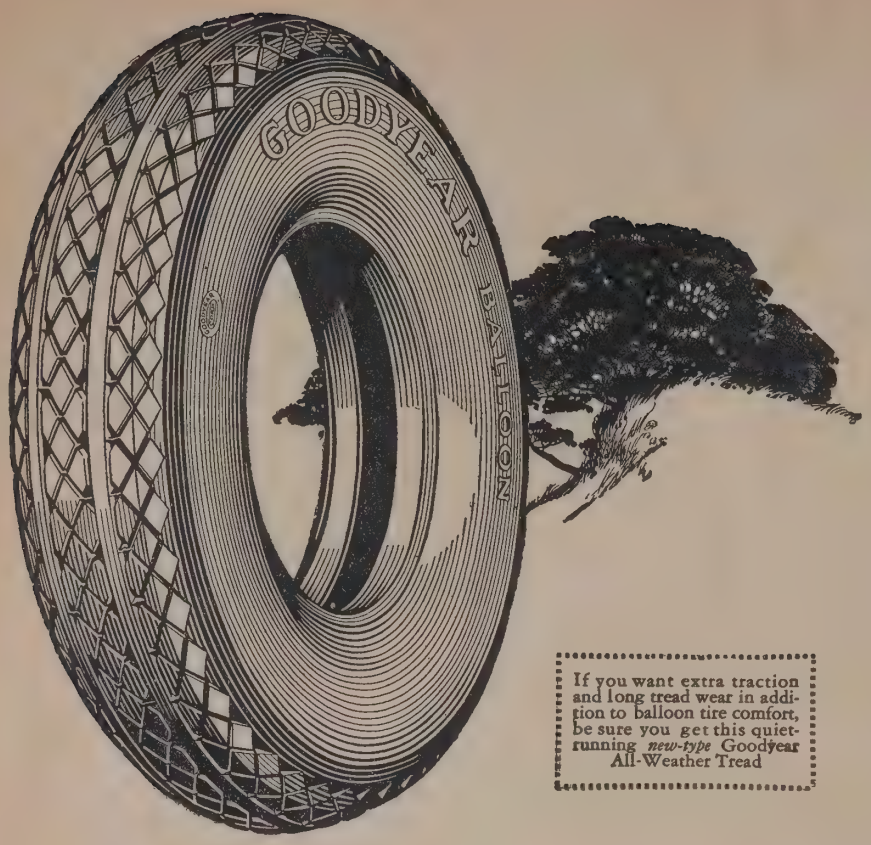


(Continued on page 536)

The Purpose of Ventilation



"A good ventilation system, if properly installed and operated, will supply without draft the abundance of fresh air necessary to the health and comfort of the cows; make possible control of barn temperature; preserve the building and feedstuffs from mold and rot due to excessive moisture and make spontaneous combustion less likely; and provide a measure of disease prevention and control."—M. A. R. Kelly, U. S. Department of Agriculture.



WARMLY BUILT STABLES ARE ESSENTIAL TO GOOD VENTILATION

THE KING SYSTEM OF VENTILATION

THE MODIFIED KING SYSTEM OF VENTILATION

If you want extra traction and long tread wear in addition to balloon tire comfort, be sure you get this quiet-running *new-type* Goodyear All-Weather Tread

An extra Goodyear value

An important extra value you get when you buy a Goodyear Tire is quite outside the tire itself.

It is the *service* performed for you by the local Goodyear dealer.

He makes sure the tire you buy is the right size and type for your car. He puts it on the rim for you. He fills it with air.

Long after the sale he continues his interest in that tire, and helps you give it the care it should have to deliver maximum results.

This service means cheaper mileage for you. It saves you money. It is an extra Goodyear value you ought to have.

It is part and parcel of the Goodyear policy: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that the user can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced Goodyear standard quality Pathfinder

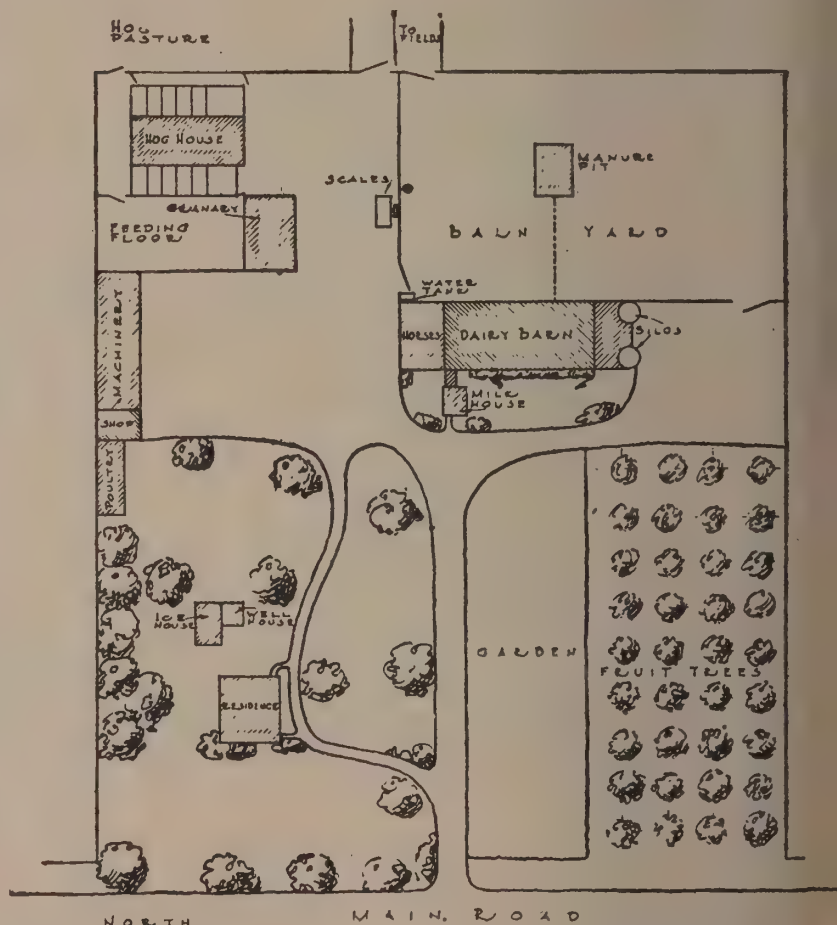
THE DAIRY FARMSTEAD

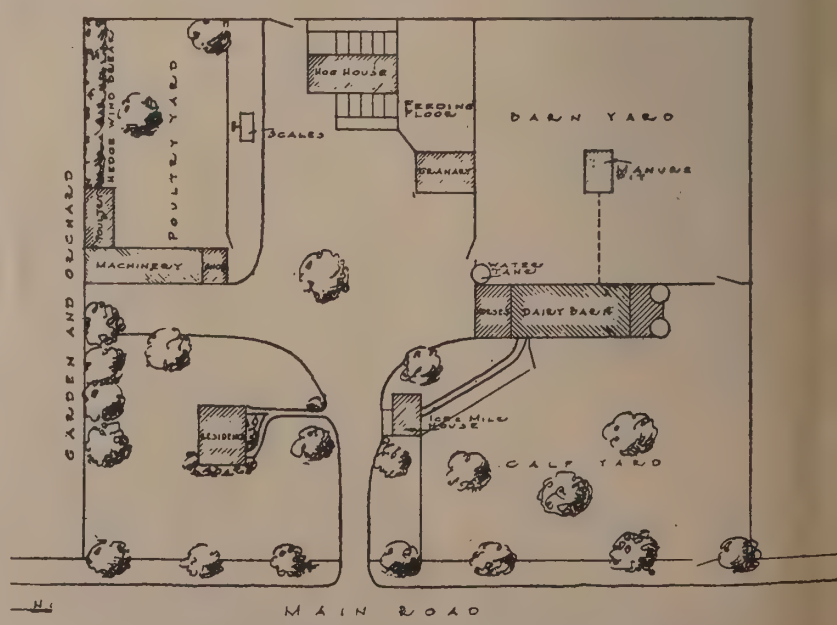
A. G. CRERAR, WISCONSIN

IN planning a farmstead the essential things to be considered are: convenient arrangement, which conserves labor; the placing of buildings to get maximum benefits from sunlight and provide a sheltered barnyard; and a grouping which insures economy of space and at the same time presents a pleasing appearance.



The barnyard should not face the house and should not be placed in the direction of the prevailing winds; that is, so that the barnyard odors and dust will be blown towards the house.

In plans shown below the barn is set long way north and south to get more sunlight into the building, as this arrangement allows sunlight to enter the east windows in the forenoon and west windows in the afternoon. When the barn is placed long way east and west the windows on the north side admit no direct sunlight. The barnyard has a southeast exposure and is sheltered from the west winds by the barn and from the nor winds by the other buildings.



The poultry house faces the sou which is desirable. The hog house far enough away from the dairy ba and house to prevent it from being nuisance. The water tank is placed that horses can be watered witho entering the barnyard.

Select the location for the house the view will be most attractive. Pla it far enough from the road that du will be avoided and yet the house w be visible and inviting. It need n face the highway, indeed it is pref able that the housewife may lo toward the highway from her m used rooms.

The lawn should not be overplant with trees, but leave open spaces admit sunlight and air. Plant a f trees at the sides and rear of t house for shade. To present the m pleasing appearance the lawn needs well arranged planting of shrubbe

The Most Outstanding Achievement in Chevrolet History!

Never before so many fine car features at such low prices . .

In developing the Most Beautiful Chevrolet and announcing it at amazing new low prices, Chevrolet achieved the outstanding triumph of its long and successful history.

Overnight, these new and supremely beautiful cars were hailed as the greatest sensation of America's greatest industry!

Bodies by Fisher . . . beaded, paneled and finished in attractive shades of lustrous Duco . . . smartened by narrowed front pillars, upholstered in rich and durable new fabrics . . . completely appointed, even to door handles located in the center of all doors.

Emphasizing the inherent beauty of the bodies themselves are certain new features of design previously regarded as marks of distinction exclusive to a few of the leaders in the high price field—heavy full-crown one-piece fenders, bullet-type lamps and "fish-tail" modeling, which lends a distinguished sweep to the rear deck contours of the Roadster, Coupe and Sport Cabriolet. A new AC oil filter and AC air cleaner, added to the famous Chevrolet motor, assure powerful, smooth performance over even a longer period of time. A full 17″ steering wheel, coincidental steering and ignition lock, improved transmission, a larger, more massive radiator, new gasoline tank with gauge, new tire carrier mounted on the frame and rigidly braced—all these are also standard equipment on the Most Beautiful Chevrolet.

See the nearest Chevrolet dealer. Drive the Most Beautiful Chevrolet over country roads or city streets. Learn for yourself why it is the most outstanding achievement in Chevrolet history!

QUALITY AT LOW COST

Car owners expect more from Kellys–and they get it!

MORE people are buying Kelly-Springfield tires this year than in any year during the company's history.

The reason is not far to seek. The tires Kelly is building today are by far the best that ever have come out of the Kelly factory. This statement is not mere talk; it is an undeniable fact, as thousands of tire buyers can testify.

Car owners have learned to expect more from Kellys, and they are getting it—this year to an even greater extent than ever before.

Yet Kelly-Springfields don't cost any more than most other tires.

Standardizing Pure-breds

E. J. PERRY, NEW JERSEY

TODAY the standardizing of fruits, vegetables, eggs, and other products is a common practice among progressive farmers and co-operative marketing organizations. There are various kinds of certified seed, seeds that have been grown under very careful supervision and have passed rigid inspection. Such standardized and certified produce is in demand and sells at a premium.

At the present time the heavy milking cows are in great demand; the man who is finding it easy to succeed with good cows and who has a high herd average in milk and butterfat is interested in still further improvement. At least he doesn't want to recede.

There is now a movement on foot among many breeders to raise the level of the pure-bred industry through selective registration. Virtually all of the owners of grade herds, who have been using registered bulls, are hoping that selective registration will speedily become an actuality. It would mean that they would have less difficulty in finding good bulls in the future. Many who have not yet been "sold" on the value of pure-bred herd sires approve the idea. It seems unfortunate to many enthusiasts for the plan, that the sentiment among breeders regarding it is still much divided.

At a recent breeders' meeting held in an eastern state, everyone present opposed it. Doubtless there are in their minds obstacles connected with the practical working of the plan which seem to be insurmountable. If, however, the plan is right in principle, it ought to be made workable. We have enough faith in leading breeders now working on it, to believe that they will evolve satisfactory regulations.

Selective registration simply means standardizing the pure-breds. If the pure-breds are to serve as seed stock for grade herds, they should keep ahead of the grades in production, at least, a little ways ahead. With the wide use of registered sires at the head of grade herds in recent years, it was to be expected that many of the grade herds would overtake some pure-bred herds in production. This speaks well for the worthwhileness of pure-bred blood.

The grade owners have really been applying the principle of selective registration by raising calves only from their very best cows. This has been a big factor in explaining the rapid increase in yearly herd average among many farm herds; and thousands of dairymen now recognize this fact. Many pure-bred breeders have virtually raised every calf because where there was a heavy investment it was not altogether in accordance with human nature to do otherwise. Regulation is needed. Most of the pure-bred breeders are now practicing selective registration, but how about many of the small fellows who do no testing of any sort? A poor registered bull from their herds injures the whole pure-bred business by destroying confidence among the grade owners in the value of pure-bred herd sires. Surely the pure-bred breeders do not want to reach that state where they would have to trade only among themselves.

The pure-bred owners face a fact and not a theory. Cow testing association records from several states now attest to the fact that when it comes to production and particularly to returns above feed cost that there is little to choose between the pure-bred cow and the grade. A study has been made of the full year records recently completed in five New Jersey testing associations.

The results are as follows:

	Yearly production per cow		Feed cost per cow	Va...
	Milk	Fat		
	Lbs.	Lbs.		
576 pure-breds	8,862	309	$132.62	$13...
598 grades	7,989	287	124.94	14...

While the pure-bred averaged higher in milk production, yet her return over feed were $9.41 less than the grade. This was probably due to the fact that many of the pure-breds were fed beyond the point of economy and that the grades averaged one-tenth of one per cent higher in fat test than the pure-breds. It is truthfully stated by leading breeders that some of the very best herds of pure-breds are not in the testing associations while most of the best grade herds are; that if the big pure-bred herds were included in the pure-bred average, that the grades would be excelled by a much larger margin. This argument in itself favors selective registration. Close selection

IMP. FANCY BROWN BELLE

This cow is the world's record Jersey (12 years old or over) owned by Elm Hill Farm, Massachusetts. She recently completed a 305-day record of 13,181 lbs. milk, 693.7 lbs. fat.

ped to bring the best herds of re-breds up to a high level of effi-ncy. The big breeders therefore ve nothing to fear in selective ristration. They should welcome it a necessary means of winning the nfidence of that great rank and file the dairymen of the country who oduce milk from the cows that they mselves have raised.

The February cow testing associa-n letter from the Bureau of Dairy lustry contains this statement: ata from these records so far ulated show that about one-third the pure-bred sires are lowering production of their daughters in nparison with the production of dams of those daughters; about e-third are raising the production ghtly; but the great increases are ning from only about one-third of pure-bred sires in use. The high-the production of the herd, the re difficult it is to raise production ough the sire and the greater the ed for using a bull of proven lity."

Selective registration should auto-tically raise the standard of pure-d sires to such an extent that a her appreciation would be attached them. It is now most difficult to vince calf raising dairymen that y could afford to build strong bull ns and practice the exchange of ir sires to the end that they may proved or disproved when their ghters come into milk. Perhaps en selective registration begins to rk, the day of buying registered ll calves for little or nothing above l prices will have passed. Since oduction is of primary importance may be advisable to start selective istration from the production ndpoint alone.

It would be cheaper and easier to ck the records than the type. The ows would do much toward main-ning and improving type. The pic-es and models of the ideal type v and bull of the various breeds are stantly appearing in dairy and m papers, along with the show g winners.

The pure-bred sire work, which has n furthered by agricultural col-es, breed associations, dairy and ed journals, and other agencies, been of inestimable value to the mers of the country. It has never ed as a boomerang to those who ieved in it. These same agencies t have advocated good pure-bred s always want to be in a position that they can continue to urge ir use, enthusiastically and con-ntiously. It would seem natural refore that all who have stood on pure-bred sire platform should e a keen interest in actively favor-the adoption of methods making sible a sure and rapid improve-nt among pure-breds.

n Arkansas Dairy Program

HOARD'S DAIRYMAN:—The Arkan-Dairy Development Association organized last March with W. H. odley, Dairy Specialist of Agri-ural Extension Service, as presi-t, and George F. McKinney, agri-urist of the M. & N. A. Railroad, secretary.

The purpose of this organization is lend every assistance possible to development of the dairy industry safe and practical basis. After con-rable discussion of the problems fronting the development of the y industry in Arkansas it be-e apparent that the present situa-lends itself to certain dangers.

The present condition of the cotton ...ds itself to the develop-...es of agriculture ...re is great ...ely in order to buy into the dairy business. Under similar circumstances farmers have been induced to buy at fancy prices cows shipped from a distance that were no better, if as good, as the native stock, causing these farmers to be discouraged and to come to the conclusion there was no advantage in better bred dairy cattle. Therefore, the association urges that all organizations sponsoring the purchasing of dairy cattle and all individuals and agencies actually purchasing, should, before buying, consult their county agent who can command the assistance of every agricultural agency operating within the state.

Realizing the only practical way to secure high producing and profitable dairy cows is to raise them, which can only be done by wider use of higher class pure-bred dairy sires; we, therefore, unqualifiedly recommend the use of good pure-bred registered bulls of known high producing records backing them.

It is the belief of this organization, based on the advice of dietitians and physicians, that a large proportion of children of Arkansas do not receive a sufficient supply of milk and milk products to enable them to grow into stalwart men and women necessary for the progress of this state. It is for this reason that we recommend that a sufficient amount of milk be produced at home by each farmer to supply the needs of his family.

It is a generally recognized fact that permanent agricultural prosperity is dependent upon permanent soil fertility which can only be maintained in a practical way by the growing of legumes. Also, that no single factor in cow feeding contributes so much toward economical production as good pastures and a good legume hay. We strongly urge the improvement of pastures in every practical way and the growing of at least sufficient legumes to provide an abundance of legume hay for all cattle on the farm.

Arkansas. W. H. WOODLEY.

Fine art is that in which the hand, the head, and the heart go together. —RUSKIN.

Greater { Performance / Roominess / Long Life

Prove CHRYSLER "50"

Greater Value

In its truly extraordinary results Walter P. Chrysler and his corps of engineers gave the public something immediate, something convincing, something final and conclusive with which to measure Chrysler "50" against and above anything around its class—either in six or four cylinders.

50 and more miles an hour.
5 to 25 miles in 8 seconds.
25 miles to the gallon.
Full-sized with ample seating capacity for all passengers.
Mohair plush upholstery.
Chrysler smartness and beauty.

From its very introduction Chrysler "50" has won overwhelming public acceptance for what it was designed and built to be—the giant of its class in Standardized Quality, outstanding performance, full family size, complete appointment and every essential that makes for indisputable value.

Coupe, (Genuine-leather upholstery) $750; Coach, $780; Roadster, (with rumble seat) $795; Sedan, $830; Landau Sedan, $885; f. o. b. Detroit, subject to current Federal excise tax.

Chrysler dealers are in a position to extend the convenience of time payments. Ask about Chrysler's attractive plan.

All Chrysler cars are protected against theft under the Fedco System of numbering.

A better living for the all'round farmer *in California*

FARM LIFE in California is all that you have imagined it to be.

There are many people from your state whose new homes in the Great Valley and neighboring valleys are but an hour or two away from the seashore, the inviting summer playgrounds of the Sierras, and the great cities on San Francisco Bay. You should see how their dooryards are brightened with golden oranges and scarlet blossoms at Christmas!

This pleasanter life is possible for any competant farmer of average resources who wants to come! With all its $700,000,000 annual farm production, California still does not produce enough of the "all 'round" farmer's crops to feed its own rapidly growing population.

California needs more farmers to produce the very crops that you know best. This need is shown by our butter shortage of 22,000,000 pounds a year—although the average butterfat production per cow in California is the highest in the United States, and California dairymen get 20% more for butterfat than the national average price.

And farming in California's golden climate is easier—so much easier that you will never think of going back. Abundant irrigation assures you of water, in place of rain, whenever you need it in summer. Farm buildings and shelters can be smaller and less expensive. Alfalfa will bring you five or six crops, and then another one for green pasturage through the mild snowless winter.

These conditions favor farming in many ways—in raising two litters of pigs a year, for instance. That means money, because California does not produce enough pork and the prices we pay our own farmers are middle-western prices plus freight.

A dairy herd with some hogs and poultry assures a profit right from the start for the capable farmer with a moderate stake. Your children will go to the finest rural schools in America. Housework as well as farm work is made easier by cheap and plentiful electricity. There are five million people already here, living better, by every standard, than any other five million people in America, with twice the average savings deposits and twice the average number of automobiles per capita.

Come out this summer, when the fruits and vegetables you buy by the dozen or in a can are ripening here on millions of acres. Or come and see California's frostless orange belt of the Great Valley in midwinter, and talk with the farmers in their shirt-sleeves. Let them tell you what it's like to live in California.

Low summer round-trip fares to California beginning May 15 —$90.30 from Chicago for example.

Californians Inc., is a non-profit organization of citizens and business institutions interested in the well-balanced development of the state. Its purpose is to give you authoritative information and to simplify your search for the opportunities that await you here. A carefully prepared 84-page book, written by two of California's foremost agricultura lauthorities, will be sent on request to any farmer who is thinking about moving to California. Send this coupon today for your copy of "Farming in California."

Opinions, Brickbats, and Bouquet

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page but your editorial must not exceed 250 words. Hoard's Dairyman assumes no responsibility for opinions expressed.

Rural Police—Religious Freedom

HOARD'S DAIRYMAN:—In your issue of March 25, Mr. Gartell wants rural police. Are the sheriffs supposed to be rural police? In my opinion laxity in law enforcement is due to politics. Some have so much influence, police dare not arrest them. The people in general do not give the proper aid to the officers of the law. They do not demand the criminal caught. If a small amount of effort is put forth, the people in general are satisfied. The person robbed is the loser. Arrests in many cases would mean a lost job for the officer. The people show far too much sympathy for the criminals which in turn forces judges to give lighter sentences and thus increase crime.

As to Sunday observance, do you believe in religious and civil freedom? Does it hurt you to see your neighbor work on Sunday? If so, then you have not a true Christian experience. Perhaps they do not believe as you do. Then why force them to obey your petty whims? Can a man call his soul his own? Do you believe a sword can change a man's belief? What caused our forefathers (the Pilgrims) to found this country? Was it not for religious and civil freedom? Should you rule your neighbor's mind and conscience? Do you believe in the constitution of the United States? Why sentence and condemn, or imprison otherwise honorable citizens?

Colorado. R. MACKINTOSH.

The McNary—Haugen Bill

HOARD'S DAIRYMAN:—When the McNary—Haugen bill first appeared in Congress many hoped it would be remodeled and amended before final passage into a really worth while measure that would be really beneficial to the farmers and to the public in general. Those who entertained these hopes were, however, unfortunately doomed to disappointment for the effect of the changes and amendments made as time wore on, instead of improving the bill, were of such a character as to prove quite to the contrary.

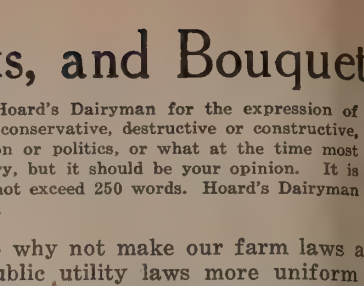
In place of a law providing rules in making contracts in buying and selling corn, cotton, hogs, and all other products, the McNary—Haugen bill undertook to set up machinery to buy and sell a certain limited number of commodities, such as corn, cotton, hogs, etc., and in fact to make contracts respecting their purchase and sale.

The bill, when it reached the President, was fearfully and wonderfully made. Nothing like it had ever been seen or heard of before.

I would compare it to a law which would provide a government chauffeur to drive my car and for a select group of my neighbors; when all that is needed is a few sensible rules for me to follow in driving my own car and to be likewise followed not by a select group, but by all of my neighbors. Because it is reasonable that the law should require us all to keep to the right in the highway when meeting another, it does not follow that the government should furnish us with drivers for some of our cars.

We don't often wear a glove on one hand and a mitten on the other, so why not make our farm laws a public utility laws more uniform respect to contracts? Until our fa legislators learn to write farm la somewhat after the pattern used writing other people's laws, I fe the farmers will have a rough road travel.

Wisconsin. B. S. HAWLEY



Against Rural Police

HOARD'S DARYMAN:—An Ohio far er writes in favor of a state ru police, or at least he pretends to and sounds like some Ohio farme But big business has so many pr agandists out pushing the rural lice movement that it is almost possible to know who is writing. state police will not help or prot the farmer.

A bill was agitated a short wh ago to create a force of 56 m Imagine what 56 men could do in state like Ohio. In the states wh they have rural police they h proven to be an expense and a bu of bullies. The farmer pays the pense while big business uses the lice to guard industries and c mines. They also come in handy the bankers later on to help set farmers off of their mortgage pr erties, just like they set the coal m ers out in the rain down in Virgi

It is better to equip your outbu ings with burglar alarms and bu shotgun and let your county she do the rest. Big business has kid the farmer into buying gold bri long enough.

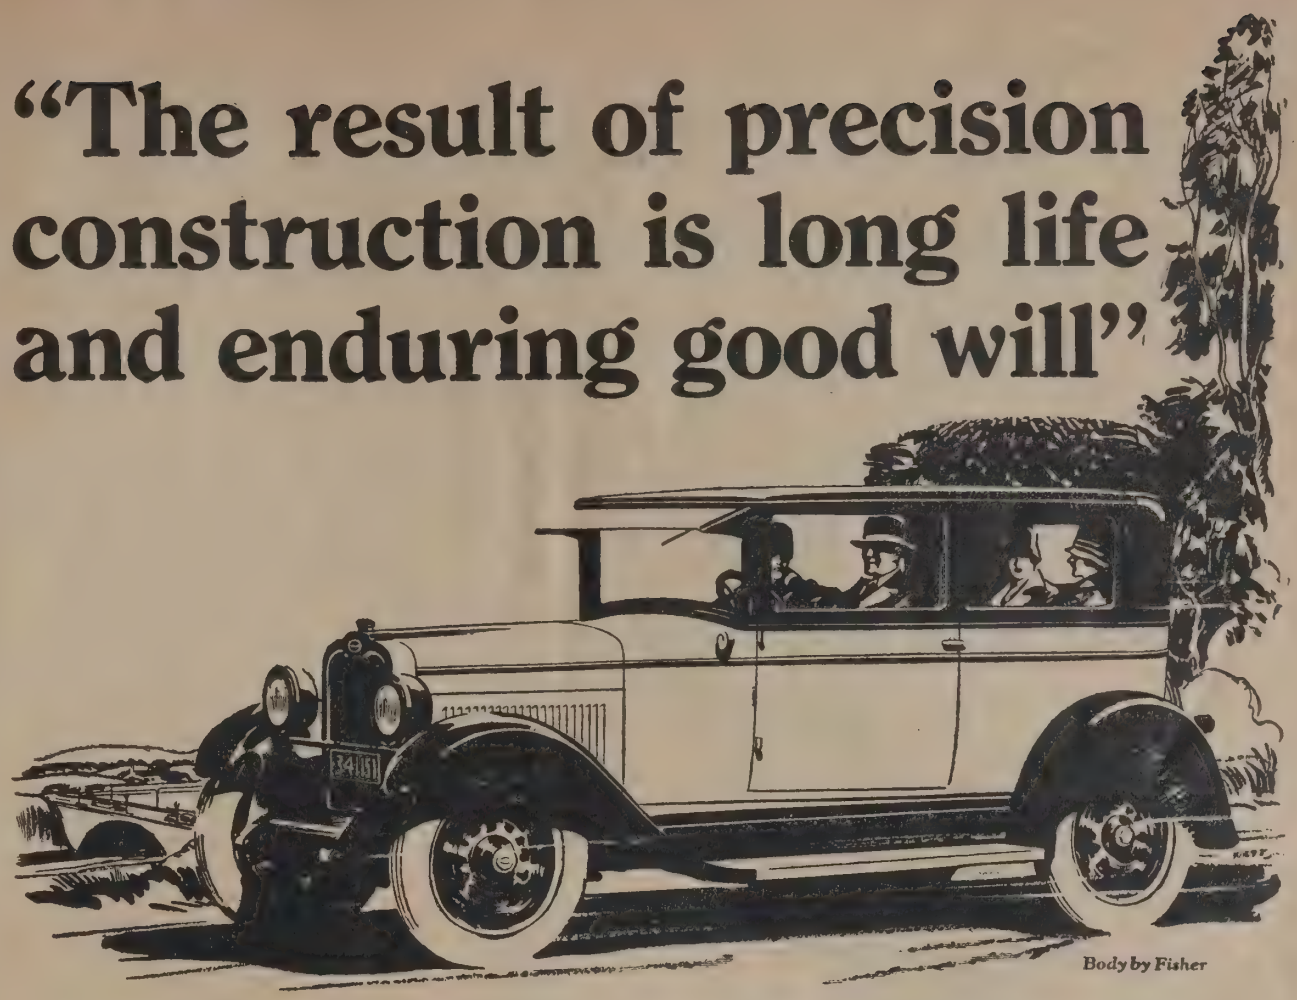
ime and Phosphate for Clover Seed

ARD'S DAIRYMAN:—There is a
of liming that has not received
ient attention—this phase is the
ue from clover seed. I recall
well the discouraging experi-
of a farmer fifteen years ago
he had suffered repeated fail-
with alfalfa. Yet last year this
r located in Delaware County,
harvested a crop of alfalfa
But for the wet season that
red harvesting and threshing
sible another crop of alfalfa
would have been harvested on
ame farm this fall.

ainage has been employed and
has been applied and inocula-
has had ample time to become
ughly established all over the
But this farmer has followed
er sound practice during the in-
ning years that no doubt has
lenty to do with his seed har-
—that is the liberal use of acid
hate on a wheat seeding, this
around two hundred pounds of
hate on a wheat seeding this
r has figured that four hun-
can be applied with just about
ame labor and the only added
se is for the fertilizer, and his
diate grain crop is sure to take
of that.

running a locomotive the first
ed and fifty pounds of steam is
ie vital hundred and fifty—but
st fifty is the margin of steam
uts the long train at full swing
eeps it there. The mineral ele-
in soil fertility is much that
-two hundred pounds of phos-
on the wheat crop in rotation
vith lime pile up a fairly good
hay crop, but the other two hundred is the margin that makes the showing in the clover seed.

Acid phosphate is the known factor in grain crops, the limiting factor in many thousand cases. Clover seed is nothing at all but a grain crop, a crop bound to be responsive to soil mineral when once the lime requirement has been met. As a boy forty-odd years ago the writer used to help thresh clover seed crops on the farm previously mentioned and it seems evident that the maturity and harvesting of alfalfa seed crops on this land now is due in short to the restoration of the mineral elements in the soil—lime essentially first, but acid phosphate just as essentially second.



One of the shrewdest, old-time farmers that I know applied lime and phosphate heavily three years ago and in less than two years he harvested a clover seed crop that canceled the entire expense for the mineral application.

Ohio. G. P. WILLIAMS.

THRESHING RED CLOVER SEED FROM A MINERAL-FED SOIL, DELAWARE COUNTY, OHIO

"The result of precision construction is long life and enduring good will"

Body by Fisher

So much has been said and written about the standards of accuracy to which the Greater Oakland Six is built that "Oakland super-precision" has become almost an every-day phrase.

Owners, in discussing the car's flashing acceleration and buoyant smoothness . . . mechanics, when explaining the why of its infrequent repairs and adjustments—

—and even women, when exclaiming over Oakland's steadiness and steering ease—sooner or later use the words "super-precision," or others very similar. But we wonder, sometimes, if the users of that phrase really appreciate its profound significance. Do they know that in the manufacture of the the Oakland engine alone, eighteen operations are held to limits of five ten-thousandths of an inch? That *thirty-three additional* operations cannot vary more than three ten-thousandths of an inch? And that three ten-thousandths of an inch is one thirtieth the thickness of an average human hair?

Yet, after all, what if they do *not* know it? What if they do not even care that Oakland has invested millions for laboratories and equipment to make such accuracy possible for the first time in a car of Oakland's price?

All they are concerned with is results . . . the result of precision construction, which is long life and flawless operation . . . the result of rigidly controlled quality, which is lasting owners satisfaction . . . the result of enduring value, which is Oakland's enduring good will!

SEDAN $1095

Oakland Six, $1025 to $1295. The New and Finer Pontiac Six, $775 to $975. Pontiac Six Commercial Cars, $585 to $770. All prices at factory. Delivered prices include minimum handling charges. Easy to pay on the General Motors Time Payment Plan.

"MILKING ONLY ONE TEAT"

is the title of a very interesting and instructive folder which every dairyman should read. It can be had *free-of-charge*, by sending your name and address to

"NEPONSET" 31 Station St., Hyde Park, Mass.

When writing an advertiser tell him you saw his ad in Hoard's Dairyman. He will appreciate knowing it.

Why build *danger* into your Home?

You can have *safety* from fire—just as easily—at no extra cost—by using Sheetrock, *the fireproof wallboard.*

Send us the coupon below and we'll mail you interesting information on how easy it is to build *safely.*

FIREPROOF . . INSULATING . . VERMINPROOF . . NON-WARPING . . TIME-TESTED . . TAKING ANY DECORATION . . EASY TO PUT UP AND PUT UP TO STAY

Sheetrock is made from pure unadulterated gypsum, ⅜ inch thick and specially surfaced for strength, with square folded edges for nailing strength and perfect union.

With the exclusive USG reinforced joint system all joints are sealed and concealed, and the smooth flat surface of Sheetrock takes any decoration, wallpaper, paint, or *Textone*, the plastic paint that combines both tone and texture in beautiful results.

You can always tell Sheetrock by the USG Sheetrock brand on the back of every sheet, with the Underwriters' stamp of approval. Made only by the United States Gypsum Company. Your local dealer has it in stock or can get it for you promptly from our nearest mill.

Sheetrock is inspected and approved as an effective barrier to fire by the Underwriters' Laboratories, Inc.

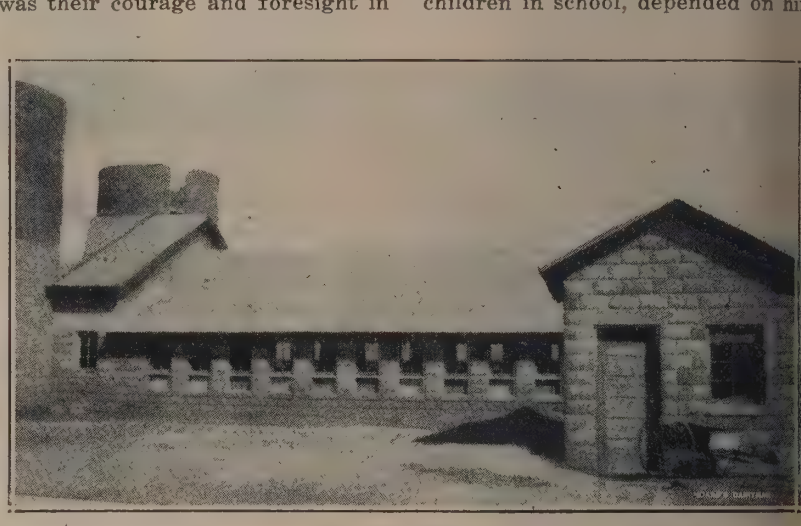
She Has Weathered the Storm



GRACE GORDON, VIRGINIA

IN the spring of 1924, Mr. and Mrs. J. C. Courter of Virginia felt that the dream of years was near fulfillment. They were $20,000 in debt but they had recently purchased a farm on the highway and built their modern dairy, cement block barn, silos, and dairy house and had one of the finest herds of Guernsey cows in the United States. They had started life on a farm away back three miles from the highway with nothing but their determination and courage to better their condition.

In 1917 they borrowed $1,000 and bought their first three Guernseys. Mrs. Courter said, "People thought we were crazy." A few years later they sold $2,500 worth of this stock and spent the money in buying a four-year-old bull, Langwater Foremost. Mrs. Courter showed us his picture, saying, "If it hadn't been for Foremost we would still be away back there off the road," but I think it was their courage and foresight in buying him. You know ten years ago public opinion in this section of Virginia didn't have much use for cows of any kind, let alone registered stock costing thousands of dollars. They said dairying could never pay here, that we couldn't raise enough feed. If we could we couldn't get anything for our milk and that the market would soon be glutted, and so on. You know it takes courage and grit to live and work our convictions when everybody thinks we are fools, but that is what the Courters did. About four years ago they sold Langwater Foremost for $20,000, keeping three of his sons and all of his daughters and bought and built their "dream dairy."

Then one afternoon in the last week of April, 1924, Mrs. Courter watched a cyclone pick up a neighbor's house, dash it to pieces in the lot beside her house, uproot great trees all around her, one falling on the corner of the house, and then whirled in its destructive fury to the new cement dairy buildings, and crushed and scattered them as if they were paper. In the barn were not only the fifty head of Guernseys which she and her husband had striven for years to acquire, but also her husband and two little boys. In the span of a few seconds' desolation, ruin and sorrow reigned at Courtland Farm instead of hope and joy. Mrs. Courter was left alone to care for her eight little children for her husband was fatally injured. What should she do, what could she do, her husband gone, and $20,000 in debt; some cows dead, others injured; and eight babies to raise—her youngest children twins but a f months old—and the eldest ch barely in his teens.

Friends advised her to sell every cow she had and then go and buy a few grades and sell little milk. She said, "No, I kn how hard it was to get what have; if I sell them and buy grad soon I will have nothing." She s off enough to enable her with w insurance she had to pay off all her debts, and she started to rebu Courtland Farm. Today, just th years later, only a few large uproo stumps, a pile of broken planks, one old badly crippled imported remain to tell the story of t storm. The barn is rebuilt on same foundation, is filled with ord making Guernseys producing s cial Grade A 5% Guernsey milk the Richmond market at a premi far above ordinary milk. She sur has weathered the storm to h done what she has done, kept children in school, depended on hi

THE BARN ON COURTLAND FARM REBUILT ON THE FOUNDATION OF THE WRECKED BARN

labor, contended with the adve weather conditions which we h experienced the past two years, "kept even," seems almost incre ble. Had she listened to her frie she would probably be selling n for about three dollars a hund and would not be preparing st for the state fair exhibit as she now doing.

Mrs. Courter is breeding not show animals but for year round p duction under ordinary farm co tions. She does not believe in for production and thinks the seven- test a farce.

Mr. Ingham, in a recent local st of Mr. Courter's work, stressed vision for Guernseys in Southw Virginia. Mrs. Courter is helping bring his vision to pass. She is only carrying on his work but sh making possible better cows for poor farmer. We asked what charged for a baby bull calf. " ten dollars I will register and tra fer them." I gasped and said, " thought we were having one given us when we got it for twenty-fiv "Yes, I know most breeders ask m but then there are so many scr through the country."

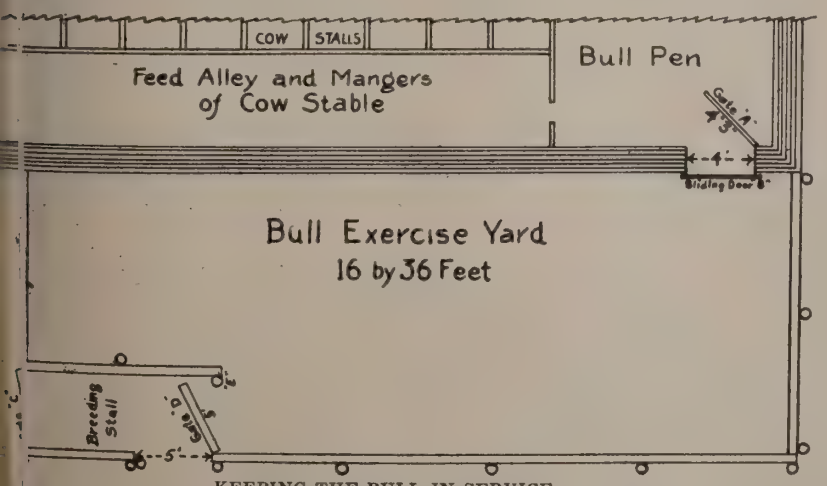
To each one of her children gives a registered heifer on th tenth birthday.

Ice cream bars are richer and m digestible when coated with ch late, creamery butter, and dry sk milk. This is the most recent use of skimmilk solids in the form. The new coating is delici and more popular than the coati now used.

A Wisconsin Bull Yard

HOARD'S DAIRYMAN:—In 1918 I rchased a five-year-old bull I de- ed to keep in breeding condition. ıad previously kept my bull in a all pen in the corner of the cow ble, but before the arrival of the w bull I cut a door through the n wall from his pen and built an rcise yard along the side of the n and in the cow yard. I kept s bull in service for four years, and en I sold him he was a sure and ck breeder although he was then r nine years old. Since then I e purchased three other old sires I ascribe their continued potency he exercise yard.

he accompanying drawing shows r I arranged it so my herd sire ld get exercise and still I would have to handle him. It keeps me and it keeps the bull safe. I can te use of an old, proved sire even e may be inclined to be ugly. The can be shut either in the pen or l whenever I want to do work in er one, and I never have to get re he can get me.



he door B shown in the drawing is g on a sloping track so it can be ned and closed from the cow le feed alley by means of a rope pulley. To keep the bull from ing the sliding door off its track n he is in his pen, I built Gate A, lowest bar of which is a foot above floor so the gate will open and e without interference with the r on the floor. I have had to re- this gate a few times because the has played with it when open. one point of weakness in my plan I don't know how to avoid it un- my conditions except to use bars I might slide through from the alley.

e breeding stall is so constructed when I desire to breed a cow the is closed to shut the bull in his cise yard, the cow is led into the ding stall, and the bull is then ad- ed. After service the bull is driv- ack into his yard and the cow re- ed from the front gate of the ding stall. At no time do I have e in the same pen or yard with ull.

e fence is built of six-inch planks ed six inches apart and it is six e high. I used large cedar posts, eight feet apart. To insure st the bull pushing the fence the posts are set rather deep in ete and on the outside of the ise yard.

e bull spends practically all his in his exercise yard, particularly the cows are turned out. He nly keeps in good breeding con- , but the walking and pawing in raveled yard keeps his hoofs in reasonably good shape. I have not handled a bull with the staff since this yard was built, and I find it convenient in every way.

Wisconsin. J. S. C.

KEEPING THE BULL IN SERVICE

The arrangement has been found safe and practical after nine years of service. The breeding stall is 5 feet by 12 feet, with 5-foot openings. Gate D is kept closed against post E with a chain. After the cow is led into the breeding stall gate D is closed against post F and gate C admitted. Following service the bull is driven back into his exercise yard, gate D closed against him, and the cow led out by opening gate C which is kept closed at all other times. A stanchion may be built in gate C or a breeding rack put just back of it to hold the cow. If a stanchion is put in gate C the breeding stall need not be over ten feet long.

Two Kinds of Cows

There are two kinds of cows on our farms today,
Just two kinds of cows and no more, I say.
Not Jersey, or Guernsey, Ayrshire, or Holstein,
For it isn't the breed of cows that I mean.

Not the fat, or the lean, or the large, or the small,
Nor the ones that stand in the up-to-date stall.
No, the two kinds of cows on our farms that I mean
Are the cows that lift and the cows that lean.

The lifter is one that brings large returns,
The leaner costs more for her keep than she earns.
Wherever you go you will find the breeds' masses
Are always divided in just these two classes.

And, strangely enough, you will find, as I've seen,
There are about ten lifters to twenty that lean.
And the dairyman finds by testing and weighing
That these noble lifters do all of the paying.

—FRANK E. ROUNDS.

The Mark of Quality

Firestone Dealers

ARE PIONEERS IN BALLOON TIRE SERVICE

Another Reason Why They Serve You Better and Save You Money—

Specializing in the manufacture of tires has enabled Firestone to concentrate upon tire development, with a record of many notable contributions to more economical highway transportation.

Firestone pioneered the low-pressure tire, and Firestone Service Dealers were the first to offer car owners Full-Size Balloons, with the latest methods and equipment for their expert care and repair.

Firestone Dealers have kept up-to-date on tire development and service—continually progressing and improving their ability to serve you better and save you money.

It will pay you to call on the nearest Firestone Dealer and let him tell you how to get more mileage out of your tires. If you are in the market for new tires you will be surprised at the low cost of a set of Firestone Gum-Dipped Balloons. See the Firestone Dealer and let him handle your tire requirements.

If Your Dealer Does Not Handle Goods Advertised in Hoard's Dairyman—Ask Him Why!

EDITORIAL COMMENT

THE average price paid by the creameries of Wisconsin for fat for the month of March was 56.6 cents per pound. The lowest price reported was 42 cents and the highest, 62 cents. This variation of 20 cents a pound causes us to wonder what kind of cream was produced that would only bring 42 cents a pound for its fat, when butter sold at an average price of 50.3 cents a pound. The patrons who received this low price for fat should direct themselves to finding out whether it was the poor quality of cream or whether it was an incompetently operated creamery that caused the low price.

MICHIGAN T. B. PROGRESS

The state of Michigan is making splendid progress in the eradication of bovine tuberculosis. It started its area testing work in 1921, and now has 34 counties which are modified accredited areas, 20 counties which have completed one or more tests, 18 counties on the waiting list, and 73 counties which have adopted the area plan.

Fortunately the dairy stock of Michigan has so far shown a low percentage of reacting animals, making the expense of eradicating bovine tuberculosis in that state relatively small. If the work can go forward at the rate it has the past two or three years, it will not be many years before the state will be free from tuberculosis.

Those in charge of the work are asking for an appropriation of only $250,000 a year and $100,000 for additional funds to take care of eight counties on the waiting list in the Detroit milk area. It is very important that this appropriation of $350,000 be made, for the city of Detroit has passed an ordinance requiring all milk and cream sold in that city after January 1, 1928, to come from herds under state and federal supervision.

It is an investment for Michigan to make this appropriation, and its legislators will be short-sighted indeed to the welfare of that state if they fail to provide funds to carry on the work. The longer the time taken to eradicate tuberculosis, the greater will be its cost.

BUILD ON PAPER FIRST

This admonition we commend to the earnest consideration of every farmer when he starts to build, be the building ever so simple. Even before he starts to build on paper or to plan, he should investigate other buildings in his neighborhood and study the various bulletins and circulars on every building project.

Time and money spent on investigations and on planning will be the very best investment that can be made. It will not only save actual dollars in building expense, but there will be greater certainty that the building will prove exactly what is wanted and that its use will prove a lasting pleasure. Failure to do these things has too often resulted in illy arranged and inconvenient buildings, has entailed larger cost in construction because lumber was wasted or was of higher cost than a different type of construction, and so on through all the mistakes that come from hasty and ill considered action.

In this and a succeeding issue we have sought to present a discussion of each of the more important buildings on the dairy farm. We have tried to make these practical and useful, yet we realize that nearly every building is an individual problem and that there is no standardized plan for dairy barn or other building that will fit dissimilar locations and conditions. We do believe, however, that the suggestions made are valuable, particularly if they will arouse a desire for more investigation.

In order to select the type of building construction, materials, labor, and feeding devices best suited to his needs and pocketbook, the prospective builder should get all the suggestions and help available on the subject and study them carefully. Bulletins from the state colleges of agriculture and from the U. S. Department of Agriculture, as also literature from concerns manufacturing material and equipment of various kinds, can usually be had for the asking. Several of the concerns advertising in Hoard's Dairyman maintain special architectural departments to assist prospective builders and an inquiry of them places one under no obligation to buy their particular materials or equipment. There will be no charges for answering a general inquiry, but if special plans and specifications are asked for, and we believe they are desirable in every case, a reasonable charge that may be agreed upon before work is started will be made.

Building on paper first is the safe way, the economical way, the best and only sensible way. In these days when every foot of lumber saved is money earned, when every hour's labor saved is money in the bank, it pays to build on paper first. If one can't do it for himself, and most of us can't, then let somebody who knows build our paper barn or paper house for us and agreeable to our enlightened opinion of what we need.

OLEO INTERESTS ACTIVE

Indiana dairy forces have been able to secure a new law on labeling and branding oleomargarine and it contains a provision forbidding the use of dairy words and dairy pictures in advertising it. A similar bill to this was passed by the Indiana legislature two years ago under the supervision of Mr. W. B. Barney, representative of the Holstein-Friesian Association of America, but it became lost somewhere between the legislature and the governor. This taught the dairy forces a lesson and they were careful this year to see that the bill enacted by the legislature was placed in the governor's hands.

In Pennsylvania, oleomargarine merchants are making an effort to repeal part of the law relative to licensing and inspecting retail distributors of oleomargarine. It is essential that this provision of the law be maintained in order to prevent bootlegging of this so-called substitute for butter.

Dairy interests must be ever alert to secure legislation and to keep it on the statute books which will prevent the illicit sale of oleomargarine. Scientists have shown that butter is a superior food product and it is an injustice to the consumer and producer of dairy products to permit any so-called substitute to be sold as a dairy product. We need an adequate tariff on vegetable oils as it is essential that we protect our home industries and an industry which is essential to maintaining a fertile soil and provides our most perfect food.

CHICAGO PRODUCERS MEET

A report of a meeting of the Pure Milk Association of Chicago stated that about 200 dairy farmers were present. This does not seem like a large number, and some may think the occasion unimportant because there were not several thousand in attendance.

We have attended meetings of milk producers in Chicago when many hundred were present and the excitement run high. If a person were not seasoned in what constitutes a sound, progressive farm conference, he might be misled by numbers and fiery speeches. Such gatherings accomplish little.

Most farm organizations that render a substantial service to their members and to agriculture started in a small, quiet way. There is nothing very exciting or stimulating about principles and practices that develop sound business enterprises. The fact is, meetings which discuss these things are likely to be rather dry and wearisome. For this reason comparatively few care to attend and go through with the ordeal of laying plans and coming to an understanding of what must be done to build a substantial organization for carrying out the will of members and rendering them the service necessary to put their industry upon proper basis.

The Pure Milk Association of Chicago is star ing in a small way and so far it has kept its fe on the ground and its head out of the clouds. It making progress, and when producers in the Ch cago territory once understand its purpose and o ject, we are confident they will join it in lar numbers and it will ultimately become the kind an organization they need to market their mi upon a proper basis. When this organization fully complete, it should mean better prices to t producers, a better milk supply for Chicago, and better service to the dealers.

BLIND CONDEMNATION

We sat in the annual meeting of the Land Lakes Creameries, Inc., and listened to the fo lowing resolution which condemned its greate market and declared that its industry had n benefited to any degree by protection:

"Due to protection the industrial East has e joyed and is enjoying a high degree of prosperit industrial wages are higher than ever before, a profits as indicated by the prices of stocks a bonds are at an exceedingly high level.

"Agriculture, which has not benefited to any d gree by protection, has been at such a disadva tage that it is now practically in a state of collap as it is impossible for our farmers to buy all their supplies on a highly protected market a sell at a world price.

"Considering these facts, we condemn unqua fiedly those interests, political and commerci dominating the industrial East which with t highest degree of selfishness have prevented t passage of all measures tending to give agric ture any degree of protection.

"We believe that this policy which has proved disastrous to agriculture will in a short time pro equally disastrous to the cities which have so f benefited from the suffering of our fa population.

"Therefore, we demand that agriculture be gi en the same tariff protection now accorded indu try and labor."

Plenty of men in this great audience were o posed to this resolution, knowing full well that misrepresented facts. Rather than to precipita an argument which might bring discord into th splendid organization, they permitted it to pa without opposition.

It seems to us we would be negligent in o duty if we did not point out wherein this resoluti misrepresents facts and how it reveals the sho sightedness of those who prepared it.

In the first place, butter, the chief product so by the Land O' Lakes Creameries, Inc., enjoys tariff of 12 cents a pound. At present butter se for about 50 cents a pound, or $1,000 per ton, a a ton of butter is protected to the extent of $24 In short, the dairy industry is one of our best pr tected industries. It would be interesting if so member of the resolution committee would poi out the industry that is better protected.

The protected industries of the East have, wit out doubt, brought that section prosperity. Th have paid a wage which permits the consumer buy Land O' Lakes butter at from 55 to 70 cents pound. Would those who favor this resolution ta away this prosperity so the wage earner would unable to pay this price for their butter?

It seems passing strange for a group of m whose industry is so well protected by the tariff declare it has no protection and to condemn section that is purchasing 70 per cent of its pro ucts. The men who favored this resolution sh themselves to be extremely ignorant of the facto which have made their organization one of t most prosperous institutions in the Northwest.

Would it be safe to place in the hands of th men who favored these resolutions the respon bility of laying plans that agriculture may be m prosperous?

Influence of Age on Butterfat Percentage

have some heifers that produce milk contain-
a lower butterfat percentage than is desired.
I expect these heifers to give higher testing
as they advance in age?
iddlesex, Vt. W. R. T.

n the average there is little change in the per-
age of butterfat in milk as an animal advances
ears. The percentage remains fairly constant
cows reach 8 to 9 years of age when it grad-
declines. A heifer giving milk testing 5 per
would be expected to give milk testing about
per cent when 12 to 14 years of age.

Meeting Market Milk Competition

n milk that averages 3.3 per cent butterfat as
mes from the herd be satisfactorily raised by
rding the fore milk so that it will meet com-
ion in a retail milk route? Can milk be col-
by feeding corn meal, hominy feed, or some
feed to the extent that it will meet the com-
ion of milk of deeper color? Would a change of
is be more satisfactory? If so, how many
nseys would be needed to supply the same
nt of milk as 30 Holsteins?
rthage, N. Y. F. B. C.

ne inquiry does not state how much the fat
ent must be raised to meet competition. If the
peting milk is assumed to contain 4 per cent
it would not be practical to raise the fat con-
of the 3.3% milk to 4% by discarding the fore
. It would require the withdrawal of too much
milk.

here competition of this kind is of serious na-
more market milk producers are meeting it
iscarding some of the low testing cows and re-
ing these with Jerseys or Guernseys. It is le-
to standardize milk by mixing the complete
from different breeds but in most states it is
legal to change the fat content of the normal
of a single breed by withdrawing or adding
ne normal milk. Normal milk of a single breed,
low 3% fat, is also not legal milk even though
ing has been done to change the fat content.

the best outlet for the product of a dairy herd
is locality is for market milk and the compe-
n indicated is of a serious nature, it would
advisable to either replace a part of the herd
cows of the higher testing breeds or make
complete change. On the average, Guernseys
produce about 75 per cent as much milk as
teins. On this basis one would need 40
nseys.

Computing Herd Averages

indly instruct me as to what is the general
tice in finding yearly herd averages. Are all
cows that have been in the herd during the
figured in, or just those that have been in
for a period of seven months or over?
rcellville, Va. L. H. C.

arriving at herd and association summaries
the year, it has been the general practice to
ude all cows that have been in the association
nine months or longer. This would exclude a
er that freshened, say, the fifth month that the
ciation was in operation and she had only
n months in the association. It would also
ude any cows that were purchased during the
and had not been in the association for nine
ths or longer. However, it would include any
s that were in the association at the beginning
ne year and were not sold before nine months
he association year had passed.

ne newer method and more satisfactory way
omputing averages is to use what is known
ne "cow month" and "cow year" basis. Under
method, the monthly averages of a herd are
puted by dividing the total production of the
by the number of cows in milk and the num-
of cows dry. In securing the average for
year, the number of cows in milk and the
ber of cows dry, together with the total pro-
ion of the herd, are entered each month in the
lar herd summary in the herd record book.
he end of the year the two columns listing
number of cows in milk and the number of
dry are totaled. These two totals are then
d together and divided by 12 which would rep-
nt what is known as the number of cow years.
nder this system of securing averages, every
that has been a part of the herd is consid-
in the average, including cows that have been
hased during the year, heifers as they fresh-
and the records of cows that may have been
during the year. It more nearly represents
true average of the herd.

ossibly the following statement of a herd that has recently come to our hands will illustrate the method of securing the herd average:

Month	Cows in milk	Cows dry	Milk lbs.	Fat lbs.
May	13	2	8,339	363.5
June	13	2	7,778	382.6
July	15		4,986	229.5
August	12	3	5,761	271.6
September	14	1	5,939	273.8
October	15		8,530	405.5
November	16		9,987	509.0
December	17		11,852	550.5
January	17		11,870	576.2
February	21		12,532	630.4
March	20	1	13,959	631.9
April	20	2	14,102	713.6
Total	193	11	115,635	5538.1
Average, 17 cow years			6,802	325.8

It will be noted that for the month of May this herd had 13 cows in milk and 2 cows were dry. In July the 2 dry cows freshened, making a total in all of 15 cows in milk; but the following month 3 more cows went dry. In November a heifer freshened, in February 4 heifers freshened, and in April 1 heifer freshened. The total production for the year was 115,635 lbs. milk and 5,538.1 lbs. fat. The cows were in milk for 193 monthly periods and cows were dry for 11 monthly periods. Adding these two together, we have 204 cow months during the year. Dividing this by 12 gives 17 cow years. This is equivalent to an average of 17 cows for the year. Dividing the total fat and milk by 17 will give the average yearly production of the herd. The number of cow years will seldom come out an even number, in which case it would consist of a fraction like 10.6 or 8.3 cows for the year.

Name, Postoffice, and State, Please

We have an inquiry dated March 26 from C. L. G., Lincoln County, Wisconsin. The inquirer will look for a reply on this page. When he sees this, will he please send us his name and postoffice? We desire to make a reply by personal letter but fear the postal employees will not accept our letter if addressed to C. L. G., Lincoln County, Wisconsin.

Last week we had one from a man who signed his name and gave his postoffice but failed to give his state. Our postal guide told us there are three postoffices in the United States by the same name as given by this inquirer. Our mailing list indicated that he is a reader and not a subscriber. What could we do? In order to serve him promptly we sent a reply to each of the three postoffices and reached the right man. Two letters came back, as we knew they would.

Something like this happens every week. We do the best we can but cannot always deliver replies to inquiries, in which cases the careless inquirers are, no doubt, disappointed. Some of it is due to carelessness; others, no doubt, assume that their inquiries with our replies will be published and that all that is needed is their initials and state. To these let us say that only a very few of the inquiries received are used for publication; all inquiries received are replied to with a personal letter whether used for publication or not. It is our policy not to pay any attention to unsigned letters.

Always sign your name, give your postoffice and state. If you do this you will get a reply if the postal employees do their duty, and they rarely fail.

Lameness in Pigs

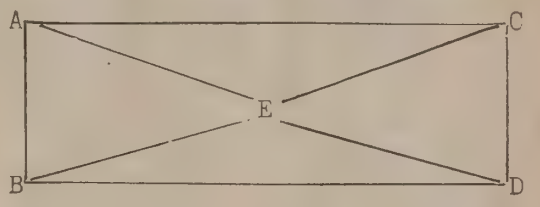
I have a brood sow that has gone down in her hind legs. It is only with great effort that she can get up on her hind feet. She seems very sensitive and sore in her hind legs, and when down rests with them crossed. My spring pigs are getting the same way. I am feeding whey, ground oats, barley and corn and boiled potatoes. What is the trouble and what can I do for it?
Thorpe, Wis. J. W.

The condition of lameness, stiffness, and occasional partial or complete paralysis in pigs is caused by a lack of minerals, particularly lime, and by a deficiency of the anti-rachitic Vitamin D.

Of the feeds now being fed all are low in Vitamin D and only one is comparatively good in calcium, that being the whey.

The remedy is to incorporate about 10 lbs. of bright green alfalfa meal or ground alfalfa hay with each 90 lbs. of ground oats, barley, and corn, mixing it thoroughly and feeding it in a self-feeder so the pigs will be forced to consume a proportionate share of the alfalfa. Continue the feeding of whey. In another feeder allow the pigs free access to a simple mineral mixture composed of equal parts by weight of salt, finely ground limestone, and wood ashes or bone meal. Do not look for immediate recovery. It will take several weeks for the pigs to get back to normal, if they are very far advanced in the condition.

Sows that are heavy milkers frequently go down behind if they have suckled large litters of pigs and have been fed rations low in minerals and Vitamin D. In addition to the remedy prescribed for the pigs, we would give this sow an ounce daily of calcium phosphate for several weeks.



Standardizing Cream

How many pounds of 5 per cent milk will it take to make 100 lbs. of 30 per cent cream? Having 50 lbs. of 30 per cent cream and want to reduce it to 15 per cent cream, how much skimmilk must there be added?

How much solid matter, including butterfat, does 100 lbs. of 5 per cent contain? How much 3 per cent milk?
Davenport, Iowa. E. D.

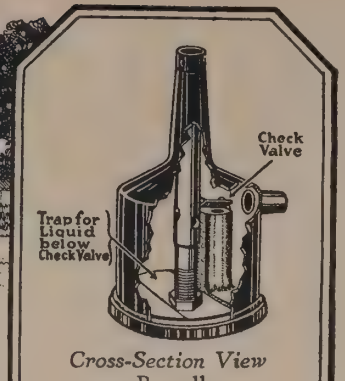
It will require slightly over 600 lbs. of 5 per cent milk to produce 100 lbs. of 30 per cent cream. This is computed by figuring the pounds of fat in the cream and dividing this by the per cent of fat in the milk. In the particular example given, it would be 100 times .30 equals 30 lbs. fat, and 30 divided by .05 gives 600 as the number of pounds of 5 per cent milk. There would, of course be a small amount of fat lost in the skimmilk and it would probably take a little over 600 lbs. of milk testing exactly 5 per cent to produce 100 lbs. of 30 per cent cream.

To reduce 50 lbs. of 30 per cent cream to 15 per cent would require the addition of 50 lbs. of skimmilk. The most simple rule for the standardization of milk and cream is indicated by what is called the rectangular method, as follows:

At the point "A," put the test of the cream or milk used; at "B," put the test of the skimmilk or milk used; at "E" put the test of the cream or milk desired. Then in a diagonal line, take the difference between the figure in the center and at "A," and place it at "D." Likewise, place the difference between "B" and "E" at "C." The figure at "D" will be the number of pounds of cream or milk to be used of the test "A" and at the point "C" would be the number of pounds of skimmilk or milk of the test given at "B."

For instance, if 15 per cent cream is to be made from 30 per cent cream by the addition of skimmilk, place the 15 in the center of the rectangle, 30 at "A," and zero at "B." This would leave, making the subtractions, 15 at "C" and 15 at "D." This indicates that it requires the same amount of skimmilk as of 30 per cent cream to produce 15 per cent cream.

If 20 per cent cream had been desired, then it would have required 20 lbs. of 30 per cent cream and 10 lbs. of skimmilk to produce cream testing 20 per cent. In this case, it requires twice as much cream as skimmilk to produce the 20 per cent cream from 30 per cent cream.

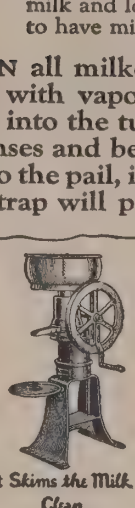


If a given number of pounds of cream of certain test is desired, the amount of cream and skimmilk to use is secured by first finding the pounds by the rectangle method, and then using the following formulas to get the total amounts to be used. To get the number of pounds of high testing cream, divide the amount at C by the total of C and D, multiplying this result by the number of pounds cream desired. To get the amount of skimmilk divide the amount at D by the total of C and D, multiplying the result by the number of pounds of cream desired. If 150 lbs. of 15 per cent cream is desired from cream testing 25 per cent and skimmilk, the figure at C would be 15 and at D it would be 10. Applying the formula we divide 15 by 25 (15 plus 10) and multiply by 150, the result showing that it will require 90 lbs. of 25 per cent cream; likewise dividing 10 by 25 (10+15) and multiplying by 150 gives 60 lbs. of skimmilk as the required amount to produce 150 lbs. of 15 per cent cream.

Five per cent milk will contain approximately 14.15 lbs. total solids per 100 lbs., as compared with 11 lbs. total solids for 100 lbs. of 3 per cent milk.

It Milks the Cows Clean

A scene sketched from a photograph taken on the farm of George Cusick, Parish, N. Y.



Cross-Section View
Burrell
Sanitary Moisture Trap

This Feature Is Essential For Low Bacteria Counts

"It is easy to make clean milk with the Burrell Milker. I consider the Burrell Moisture Trap absolutely essential for the production of clean milk and low bacteria counts. I supply the village of Parish and have to have milk of low bacteria count."—*George Cusick, Parish, N. Y.*

IN all milkers, the space in the pail above the milk is filled with vapor during milking. Some of this vapor is drawn into the tube leading to the vacuum pipe line. There it condenses and becomes contaminated, and, if allowed to flow back into the pail, it contaminates the milk. No ordinary check valve or trap will prevent this—but the Burrell Moisture Trap *does*.

It Skims the Milk Clean

For many years, the wonderful Link Blades of the Burrell-Simplex Cream Separator have made it famous as the *closest skimmer*. It has a greater capacity for the size of its bowl, for the speed at which it is operated, and for the power required to run it than any other separator. It is simple, light and easy-running. But, above all, *it skims the milk clean*—and that's what you want in a cream separator. Four sizes—350, 500, 750, 1000 lbs.—hand or power driven.

It Prevents Contamination

The Burrell Sanitary Moisture Trap catches any condensed vapor which flows back from the pipe line. The check valve, being located above the liquid in the trap, prevents an inrush of air from carrying this contaminated liquid into the pail. The Burrell Sanitary Moisture Trap is a necessary safeguard against high bacteria counts.

4 Exclusive Features

There are four exclusive features which make the Burrell the *perfect* milking machine. The first three are interdependent—each increases the efficiency of the others. (1) The *Automatic Controller*, which regulates the suction to suit exactly each individual cow; (2) the *Air-Cushion Teat Cup*, which supports and compresses the teats by air alone; (3) the *Positive Relief Pulsator*, which gives complete rest between pulsations and assures natural circulation; (4) the *Sanitary Moisture Trap*, which entirely prevents contamination from the pipe line.

The Burrell Milker is noted for its simplicity. It is a single tube system, with only half as many rubber parts as the ordinary type of milker.

Send For Valuable Free Books

Here are two valuable, illustrated books that are free to dairymen. One pictures and describes the Burrell Milker and explains how "*It Milks the Cows Clean*". The other tells about the Burrell-Simplex Cream Separator—all about its simple, sanitary, rugged construction, and how "*It Skims the Milk Clean*". Every dairyman should have both of these interesting, practical, helpful books for handy reference.

Sweet Clover for Pasture

E. B. FITTS, PENNSYLVANIA

THOMAS Beaver, who operates a dairy farm on the outskirts of Bellefonte, Pa., has demonstrated in an impressive and convincing way the value of sweet clover as a pasture crop.

A field of thirteen acres near his barn and along the Bellefonte—Lock Haven Highway was seeded with sweet clover with oats in the spring of 1925. Following the oats harvest cattle were allowed to graze lightly during the fall months and considerable feed realized. Early last spring his entire herd of 22 Holstein cows was turned into the field and kept there day and night until September, excepting when in the barn for milking. The cattle had all they could eat and were barely able to keep up with the growth of the clover until late in the summer. No supplementary feeding was done excepting grain and of this much less used than during previous seasons. The cattle milked better than ever before and when the writer saw them early in August they were sleek and contented and in vigorous working condition. An increased milk flow of about 1,500 lbs. per cow over the previous year, when the cows were on ordinary grass pasture, was realized and the amount of concentrated feeds used during the summer reduced about twenty per cent.

An adjoining field of 15 acres seeded to sweet clover in wheat spring and this was used to sup ment the pasture as the feed g less during the fall months. This ond field will become the main ture during the present year.

It is Mr. Beaver's plan to dev three fields near his barn to a th year rotation of sweet clover, sil corn, and oats or wheat, respectiv He will thus have each year a f for pasture, another for silage c and a third for grain. He belie that this rotation will provide a m mum yield of milk per acre and low cost. In addition, his cows always be close to the barn, alw have an abundance of feed, and ways be in good physical conditi

The writer believes that sweet ver has the possibilties of great fulness as a pasture crop. Natu grass pastures have generally come sadly depleted and supply little feed excepting during ea summer. Sweet clover pasture s plies feed in abundance during most the entire summer and gi very large yields per acre.

Pasturing arable land is a revo tionary idea in many communit but Mr. Beaver and other progress dairymen are demonstrating that is a practicable and profitable pr tice.

Improving Marsh Soils

A new bulletin has just been issued by the Wisconsin Agricultural Experiment Station that should be of considerable interest and service to many Badger farmers. Bulletin 392, entitled "Fertilizers and Crops for Marsh Soils," discusses types of marsh soils, drainage, fertilizer needs, methods of application, and crops best suited to such soils.

As illustrations of the possibilities in crop increases from the application of fertilizer the following results are cited: The 5-year average of corn on peat marsh soil at University Farm was 22.8 bushels per acre on untreated land; this was increased to 70.6 bushels with the application of 12 tons of manure, while 200 lbs. of muriate of potash per acre resulted in 67.7 bushels per acre. The cured hay per acre was increased from 2,205 lbs. on untreated soil to 3,625 lbs. by manure and to 3,645 lbs. by the potash.

On an acid peat soil at Marinette no treatment resulted in a failure of barley and brought only 66 bushels of potatoes per acre, whereas one ton of ashes (potash 5 per cent) resulted in 26 bushels of barley and 142 bushels of potatoes. One ton of ashes and 300 lbs. of acid phosphate per acre resulted in 36 bushels of barley and 196 bushels of potatoes per acre.

At the Coddington Experiment Farm, about 12 miles south of Stevens Point, no treatment gave 3.3 tons of corn silage, 16.47 bushels of oats, 8.3 bushels of rye, and .8 ton of mixed hay per acre as a five-year average. The application of 150 lbs. of muriate of potash per acre gave 5.2 tons of corn silage, 34.06 bushels of oats, 22.84 bushels of rye, and 1.2 tons of mixed hay per acre. Eight tons of manure per acre gave 5.6 tons of corn silage, 28.89 bushels of oats, 16.96 bushels of rye, and 1.1 tons of mixed hay per acre.

The authors of the bulletin do not argue for increase cultivated acreage by draining and treating extensive marsh tracts, but rather that the improvement of small marsh tra on existing farms could well be dertaken. The bulletin tells how t may best be done.

A NEW BOOK

"QUALITY IN DAIRY PRODUCTS"

—BY—

PROF. E. H. FARRINGTON
Chairman of Dairy Department

Holmen Co-operative Creamery

O ned and Controlled by Patrons

H w the Holmen creamery became ue co-operative organization, v d and controlled by its patrons, a related recently by the manager, Keppel, before the annual con- n of the Wisconsin Buttermak- s Association at Fond du Lac.

Te Holmen Co-operative Cream- y Association was organized in 8 At the annual meeting of the o holders in 1922, it was voted to a a new creamery on a new site. he officers found that some of their o holders were not patrons, and m of their patrons were not stock- l rs. Under the terms of the build- g lan which called for a bond issue 0,000 to be retired in ten years o a fund created by retaining one- al cent for each pound of butter a during the year, patrons, not t k h o l d e r s, were contributing toward the payment of the new creamery, the title to which rested with stockholders, many of whom were not patrons.

To remedy this situation the articles of the association were amended (1) to grant every patron the privileges of a stockholder and (2) to offer to refund to any stockholder the money paid for stock certificates.

"These by-laws do not compel any stockholder to dispose of his stock," said Mr. Keppel. "But it can be made unprofitable to continue to hold such stock. We did this by stopping the payment of interest beginning the following year.

"We are now a non-stock co-operative association in possession of an up-to-date creamery building representing an investment of no less than $40,000. This investment reflects itself not as a stock certificate to the individual, but as an investment accruing to the farm in exactly the same way a good road investment reflects itself to abutting property.

"When a farm owned by one of our patrons is sold, the equity in the creamery goes with the farm the same as the good road equity does. The new owner becomes a patron stockholder of the creamery. When he ceases to be a patron he ceases to have a voice in the conduct of the creamery."

A teacher asked her class to write an essay on London. She was surprised to read the following attempt:

"The people of London are noted for their stupidity."

The young author was asked how he got the idea.

"Please, miss," he said, "it says in the text book that the population of London is very dense."—Brooklyn Standard Union.

Picturing the Light Six Sedan

A Quality Six with a Big 7-Bearing Motor
at the Price of a Four

Before you buy any car at less than $1000 glance over and into this Nash Light Six Sedan. And be sure to drive it!

It is a Six, not a Four, and a Six with 7-bearings, *the world's smoothest type.* And most aggressive, as well. Watch this Nash step ahead when you step on the accelerator.

This car has the finest type of 4-wheel brakes in all the world. Front wheel brakes internal expanding—rear wheel brakes external contracting—*two-way* action for greater efficiency and safety.

And nowhere else will such a low price buy so much quality in finish and fittings. There are Double Beam Headlights; Air cleaner; Oil filter; Gasoline filter; Alemite High Pressure Chassis lubrication; Automatic windshield wiper; Rear vision mirror; and 5 Budd Michelin Steel Disc Wheels.

Instruments, including a gasoline gauge, are grouped in an attractive panel on the dash. All these are features you need for safety, comfort and satisfactory performance.

You always will be proud of your good judgment—your satisfaction will never end —when you buy a Nash! (5662)

A New Sanitary Finger Pull Cap for Milk Bottles

LOW COST A new sanitary cap that fits tight. Easy to remove from bottle with fingers. The household appeal of Kuvercaps gets new customers and holds the old. Try out a few and see how popular they are. The cost is small—they build new trade quickly. Ask your supply house for samples and prices, or write us. We also make "Midwest" Standard Disc Caps—noted for quality.

MID-WEST BOTTLE CAP CO.

answers the question

"What about getting a milking machine?"

You can't tell how fast a horse can trot by judging the speed of a cow. And you can't tell what a milking machine can do for you *until you use the Hinman.*

Success for 19 Years Straight

There's no question about what *this* machine can do. It *has been* a success on thousands of dairies, *for 19 years straight.* Why? *Dependable. Simple.* Only 2 moving parts. No complicated mechanism to get out of order. Valve chamber *guaranteed for life of machine* and easy to clean as a tumbler. Shortest hose.

Gentle application of vacuum and *complete* release after every suction. Soothing—cows like it. Many prize cows milked with it—made their winning records—including the champion cow of England.

Fruit Grower Makes Good With Dairy Cows

HOARD'S DAIRYMAN:—Berrien County, Michigan, is preeminently a fruit county, so much so that a bad year or a late frost puts many growers in a difficult financial position. Efforts have been made to change this by the introduction of the dairy cow. Two flourishing cow testing associations now tend to stabilize the farm industry and make every year a good one.

Fred Carter is an example of what may be done. Realizing that he needed a crop rotation, impossible with fruit, also cheaper manure and a steadier source of income, he started with a few grade cows two years ago. Up to that time Mr. Carter had had no experience with the dairy cow so he joined the North Berrien Cow Testing Association and started an intensive study of feeds and feeding.

This month Mr. Carter's herd led the association with 1,072 pounds milk and 44.8 pounds fat.

He finds that the raising of alfalfa and sweet clover fits into his farming operations and that the manure produced saves the purchase of this ... cessity from the stock yards and ... the prices received from milk in a ... fruit county are very welcome in ... in the winter months when the ... and melon checks are few and ... between. IVER IVERSEN, Test.

Cow Testing Pays in Tea

HOARD'S DAIRYMAN:—The Tea ... C. T. A. in Wise County is ... some real good for the dairy indu... in the county.

The association report for ... month of March shows an increa... the number of cows and an inc... in the average production of ... pounds milk and 53.9 pounds fat ... that of last month. These result... due to the selling of 45 poor pro... ing cows, and to the feeding of b... rations.

That the association is saving ... dairymen money is shown by the ... lowing report given of a mem... herd that has been in only ... months:

The two tests are taken for 31... periods each, and the price of th...

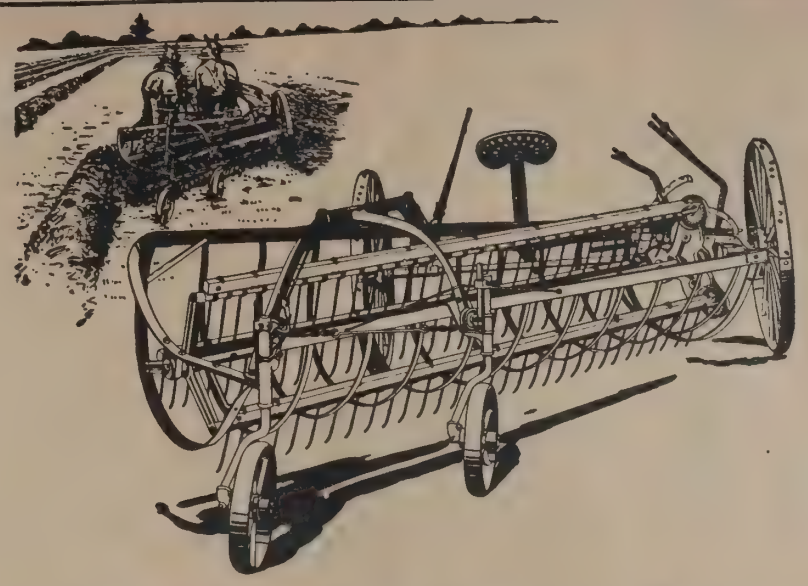
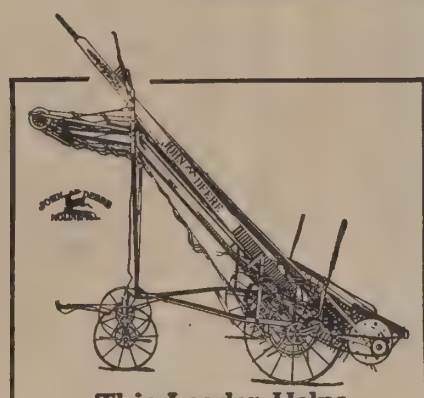
figured at 43 cents per pound in
)th tests.
In the first test the herd produced
417 pounds milk testing 4.3% fat,
189.9 pounds fat worth $81.65.
he cost of the feed was $32.86. The
ılue of the product minus the cost
feed is $48.79.
In the second test the herd pro-
ıced 4,825 lbs. milk testing 5.1% fat,
243.8 lbs. fat worth $104.83. The
st of feed was $39.02. The income
ove feed cost was $65.81.
The increase in milk production
as 408 pounds, due to better feed-
g; the increase in fat was 53.9
unds, due to the removing of the
lves from the cows and milking all
e milk from the cows instead of al-
wing the calves to get the strip-
ngs or last milk. The feed cost was
creased $6.16 in the second test.



T. H. ROYDER, Tester.

Association Organized Calf Club



HOARD'S DAIRYMAN:—The Richland
ssociation, Wisconsin, has organized
calf club with 25 members enrolled.
is a big improvement to any asso-
ıtion to get young folks interested
young stock and in learning how to
ed and develop young stock.
Five members have ordered the
isconsin farm record books; two
ve signed for the soil test by soil
ecialist from the university. Mem-
rs are in favor that the state should
propriate enough money for the
isconsin Dairymen's Association to
pervise and promote C. T. A. work.
The duplicate barn book sheets are
ing left with the members. I be-
ve it a good plan as the members
n check up on the tester very easily.
The tester helped one member pur-
ase a herd sire from another mem-
r in the association. The dam of the
lf made 387 pounds fat last year as
2-year-old. PETER NELSON, Tester.

California County Has Big C. T. A.

Los Angeles County, California,
asts a cow testing association that
quires six testers and embraces
arly 5,000 cows with full year rec-
ds. The association is under the
rection of the Dairy Department of
e County Farm Bureau.
The herds average large in that
unty—70 cows to the herd. The
sociation has 62 members. Nine
rds have more than a hundred
ws each, the largest being the
ade herd of the Adohr Stock Farms
mprising 775 cows. This owner al-
s has a pure-bred herd of 70 Guern-
ys. The Arden dairy had 511 cows
ish yearly records. The average
oduction for 4,730 cows last year
s 346 lbs. butterfat.
The officers and directors of the
sociation and local business inter-
s believe in giving dairymen some-
ng to work for. At the last annu-
meeting held last November 34
autiful silver loving cups and 240
bons were given to winners of the
rious classes.
Awards are based on a point sys-
n of scores. The Pottenger Sani-
ium, Carl Williams, manager, won
e sweepstakes trophy donated by
rm & Orchard with 149 points for
re-bred herds. Twenty Holstein
ws in this herd averaged 559.8 lbs.
f. Second place was won by Santa
nica Dairy Company with 127
ints. This herd of 37 pure-bred
olsteins averaged 441.8 lbs. fat.
The sweepstakes cup for grade
rds was won by S. W. Baekema
h 150 points and a herd average
503.9 lbs. fat on 21 cows. Adohr
ck Farms won second with 147
nts and a herd average of 354.3
. fat on 775 cows.

"Hay in the Barn Seven Hours After Cutting"

This Loader Helps Cut the Costs

The John Deere Double Cylinder Loader is the ideal machine to use with the Side Delivery Rake—a combination that saves 40 per cent in labor costs.

The loader automatically adjusts itself to handle the heaviest windrow or lightest swath. It handles the hay gently without shattering the leaves. The floating gathering cylinder, studded with flexible fingers follows the uneven ground and gets all of the clean hay.

Adjustable carrier makes loading easy in windy weather. Easily raised and lowered by man on load.

"We had alfalfa in the barn seven hours after cutting and the hay was in excellent shape. Although it was poor hay weather, we never put up hay so cheaply or that was any better."

Thus Ralph I. Lesher of Antrim County, Michigan, relates his experience in making hay the John Deere Way, using a

John Deere Side Delivery Rake

The results obtained by Mr. Lesher explain why farmers in all sections are adopting the John Deere Way.

They know that the leafy, green, high-protein hay produced by curing the John Deere Way is good for their stock.

They know that hay made the John Deere Way grades uniform and brings high prices on the market.

The John Deere Way is simple and sensible. The John Deere Side Delivery Rake with Curved Teeth and Inclined Frame is the only machine that is needed. It provides for protecting the leaves in the shelter of loose, fluffy windrows, from the time the hay is cut until it is ready to store. The leaves are the "bran" of the hay, and when you save the leaves, you save 65 per cent of the feeding value.

The curved teeth lift the hay. The inclined frame gives greater capacity where the volume of hay is heaviest. Most of the leaves are protected; they do not become brittle and shatter as they do when exposed to the sun's rays.

See these machines at your John Deere dealer's. Write for folders describing them. Address John Deere, Moline, Ill., and ask for Folder SD-414.

JOHN DEERE

JOHN DEERE MOLINE, ILL.

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

The ration for the Pottenger Sanitorium herd for July consisted of a grain mixture composed of 200 lbs. each of wheat bran, ground oats, and rolled barley; 100 lbs. each of corn meal and cottonseed meal; 50 lbs. of cocoanut meal; and 12 lbs. of sugar refinery bone. Twenty-three cows consumed 340 lbs. of this mixture during the month, or about 15 lbs. per head daily. In addition the herd consumed 200 lbs. dried beet pulp, soaked before being fed, and each cow consumed from 17 to 20 lbs. of alfalfa hay daily.

Tuscola C. T. A. Shows Gain

HOARD'S DAIRYMAN:—This association has completed another successful year—successful in that there has been another substantial gain in average production over the previous year. The C. T. A. stands for more economical production of milk and fat. It aims to accomplish this by culling out the poorer cows, by assisting in the arrangement and care of buildings and equipment, by considering herd management, and by fitting the cheapest, correct ration to the individual cow.

The C. T. A. does not wish to encourage the horse-race aspect. It encourages the making and publishing of records only as a means of giving evidence that its aims are being accomplished, and as a stimulant to interest.

The report of last year's work gives conclusive proof that the dairymen of Tuscola County are coming to the front. The average fat production per cow in 1924 was 262 lbs.; for 1925 it was 306 lbs.; for 1926 it was 348 lbs. In 1924 thirty-one cows qualified for R. O. P. certificates; in 1925 forty-nine cows qualified, and in 1926 eighty-four cows qualified for the same.

Suppose a dairyman had ten cows which produced fat at a rate similar to the average production of the association, and sold it at 45c per pound. His average gain per year in terms of cash would be $193.50 from the ten cows. The cost to him for ten cows would be $45 per year.

The difference between a cow chewing her cud and a flapper chewing her gum is that a cow always looks as if she were thinking.

Connecticut Milk Producers' Association

Marketing about half the milk produced in the state, from 3,352 members representing approximately half the commercial dairy farmers of the state, is the record of the Connecticut Milk Producers' Association upon rounding out a decade of operation.

With contracts for 302,000 quarts of milk daily sold in 35 different towns during 1926, the association has marketed *all* the milk of *all* its

CLIFFORD HOUGH

contracting members *all* the time. "Our pooling contracts deserve credit for this accomplishment," says General Manager C. E. Hough in his eleventh annual report, January 3, 1927. "In 1926 our membership produced and sold more than 12 million dollars' worth of milk. This volume has increased every year since we began operation."

That members of the association have received, as a result of co-operative effort, two million dollars more for their milk than they would have received had prices in surrounding territory prevailed, is the opinion of Mr. Hough. If this sum were divided equally among the members it would amount to $600 per farm.

"The government census figures show that in the last five-year census period, Connecticut has increased her cow population by one per cent. Our dairymen are spending a million dollars a year for the purchase of cows. They are apparently doing this because they consider the cow a profitable animal to own. Could we have purchased these cows if our income had been two million dollars less per year?" asks Mr. Hough.

"Government reports record the present value of Connecticut land at $77 an acre or approximately wartime value. What would be the value of our land if our members received two million dollars less a year and could not buy the cows to maintain fertility or to sell dairy products from?

"I will venture the assertion that without co-operative milk marketing in Connecticut there would be many abandoned farms and lower values would prevail on all farms occupied to the extent of many millions of dollars."

Increasing the membership, the milk contracts, the producing area, the number of markets and dealers, the price of milk, the number of cows, the value of farms, the stability of business, the public's confidence in milk, the consumption of milk, the dealers' confidence, the confidence and understanding of the membership, the prosperity and happiness of the members—these are the results of co-operative marketing in a decade of operation by the association.

The following table shows the growth of the association for the past six years and the price increase:

Year	Membership	Ave. price 4% milk per 100 lbs.	Quarts milk under contract daily
1921	1,445		58,000
1922	2,008	$3.48	118,000
1923	2,487	3.71	204,000
1924	2,934	3.64	224,000
1925	2,923	3.84	234,000
1926	3,100	3.84	277,000
1927	3,352		302,000

The last month reported, November, 1926, shows an average of $4.14 per 100 lbs., the highest price paid members in the history of the organization.

Producing Certified Milk

Scout John S. Thomson of Troop 159, Brooklyn Boy Scouts of America, has written the following article on producing certified milk. It appeared in "The Council Ring," the publication of the Brooklyn Boy Scout Council:

"A certified cow leads a darn hard life!!" That's what I said to my dad after I had visited a certified farm from which some of the milk certified by the Kings County Milk Commission is obtained.

Miss Cow lives in an individual stall with her neck in an oblong collar affair. The "collar" is arranged so that she can stand up or lie down in comfort, eat her meals from her own trough and drink her water from her own private water fountain. It is also possible to adjust the collar in such a way that it is impossible for her to lie down when the dairymen are ready to milk her, clean her, or fit up her stall.

For bedding, wood shavings are used. They are sweet, clean, and easily handled.

At the back, on the floor of the stall, is a ridge which is placed across the width of the stall and so arranged that Miss Cow, when she lies down, keeps herself on the clean floor covered with wood shavings.

Back of stalls runs a ditch where all her waste matter is deposited. It would not be very comfortable lying on that ridge and that is why she keeps her belongings inside the stall, out of the waste and thus clean.

Certified cows only go out of the stalls once in a while for exercise in the yard and a change of scene in the pasture. The food they eat is carefully planned so that she gets nourishment of the right kind to keep her healthy and make her milk of the best quality.

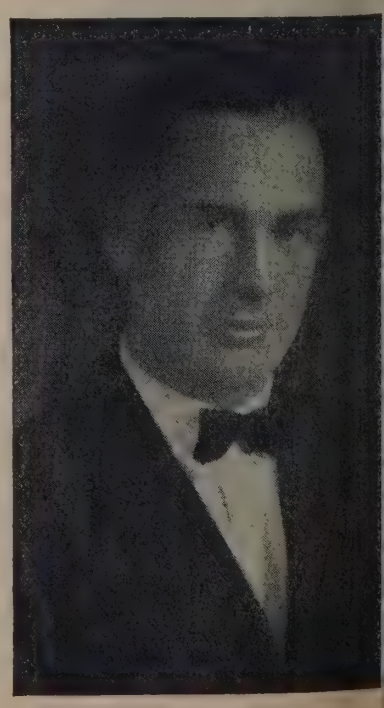
Before milking she gets a thorough currycombing. Her tail is wiped off. Her flanks and udder are washed. She is made so clean that dirt cannot get into the milk. It just isn't there.

The men who do the milking are as clean as the cows. They have shower baths. They have to wash before they work, and get all dolled up in white suits and hats that have just come out of the sterilizer. The milk pails are sterilized in a dry, hot room and so are the stools the milkmen sit on.

When the milker has a full pail he immediately takes it to a receiving tank. He pours it into the tank through a strainer made of sterilized gauze. From the tank the milk runs through a cooler. The cooler is made of covered coils of cold pipes over which the milk trickles.

From the cooler the milk goes through a pipe to the bottle-filler. It enters the bottles through a strainer of sterilized gauze. The bottling ma chine is a round tub that revolves. I has nipples on the bottom that fit ir to the necks of the milk bottles. Th milk bottles are taken from a meta box in which they have been steri ized by steam and placed on an auto matic conveyor. When they get unde a nipple they get pushed up and re lease just enough milk to fill then Then the bottle is conveyed throug the capping and sealing machine From there it goes to the man wh places the hooded, sealed bottles c certified milk in cases and cover them with ice.

The bottle of milk is now ready t be sent to the home of the bab who must have the cleanest mil obtainable.



Wild Onions

HOARD'S DAIRYMAN:—For the pas three years we have eliminated onio flavor from our milk by using the fo lowing home-made mixture: Equ amounts by weight of salt and pow dered charcoal, one-fourth amou each of baking soda and powdere sulphur, all well mixed. We usuall add a little cottonseed meal to mak it more appetizing. Two days befo turning the cows out we start fee ing the salt mixture, one heaping t blespoonful at a feed. At first w mix each spoonful of the salt mix i one pound of the grain. As soon a the cows get used to it we put it d rectly into the manger and put th grain on top of it.

Our cows are turned to pasture b 6 a. m. and brought in by 1 p. m Some people say the onion flavor wi not be noticeable when the cows a brought in that early even if the are not fed the salt mixture. Our cu tomers can taste it for two days u less we use the salt, then the mo critical ones never have a sing complaint.

We do not turn cows out on o pasture until about the middle April, not because of the onions b because we have found that it pa big dividends to let the pasture get good start. Last year we had a ve early drouth and one of long dur tion. All early grazed pastures ga out, but our pastures carried through without causing a slump the milk production. We have tw pastures and alternate grazing fro one to the other, usually about eve three weeks. In this way we car more stock to the acreage than could do in any other way.

Virginia. GRACE GORDON.

Ernest M. Wright, newly selected field secretary of the Iowa Holstein Breeders Association, Inc.

News from Washington, D. C.

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, D. C., April 26—Preparations are now in hand for the general census of 1930 which will take place, unless something goes wrong with the necessary appropriation bill to pay the cost, during the month of January, 1930. In this census an effort will be made to get a more accurate count of the dairy cows which has proven a difficult problem. It has been easy to get a record of the number of cows milked during the year, but to segregate these into "dairy cows" and "beef cows" has proven another story. The item required on each farm schedule of total amount of milk produced, while it is believed to have produced a fairly accurate total, has in detail resulted in some very amusing figures being submitted, figures which at best have seemed to be pure guesses.

Continued reports reaching Washington indicate the seriousness of the corn borer situation, and while great expectations are had as to the effectiveness of the extermination campaign now well under way through federal and state co-operation, the general opinion is held here that its steady, although retarded, progress into the corn belt is indicated, and that great changes in farm systems will inevitably result. "The corn borer will not destroy the corn growing industry," says one careful student in the Department of Agriculture, "but it will make it necessary to handle the corn crop differently."

The Bureau of Dairy Industry just at this time is instituting a careful study into the methods of handling bottled milk, to determine the conditions and causes of the rapid and often hard-to-understand increases in bacteria count experienced in milk which presumably has had the most careful pasteurization and handling. Numerous cases have been reported where apparently without cause milk which has been going on week after week with a fine record of low count, suddenly develops a much increased count. The specialists of the Bureau have been surveying numerous milk plants to determine the causes for such phenomenon. In most cases they are successful in locating some weak place which has developed in the system in use. Careless opening of doors in cooling rooms is one frequently found error. Most of the error found is traceable to some human fault or failing. An interesting report will be issued on this study.

The principal dish set before the Dairy Pilgrimage visitors at the luncheon served to them by the Bureau of Dairy Industry at the Department Laboratories was waffles and maple syrup. The waffles were made with the new condensed sour milk, the manufacturer of which has been developed by the laboratories. The maple syrup was supplied by A. M. Loomis, Secretary of the Dairy Federation, and came from a sugar bush in Vermont alongside the bush on the John Coolidge farm, now owned by the President.

A last minute disappointment at the Dairy Pilgrimage was the absence of Secretary of Commerce Herbert Hoover who was scheduled for an address Thursday morning. Secretary Hoover was detailed by President Coolidge, on the Saturday morning before the Federation gathering here, to go to Memphis and take charge of the work of rescue and restoration in the flood situation in the Mississippi and Arkansas Valleys.

A consular report, received last week at the Department of Commerce from Frankfort-on-the-Main, Germany, indicates that German scientists have discovered that the new ultra-violet rays can be used to detect the adulteration and misbranding of dairy products, especially milk, cream, and butter. Under these rays from a quartz lamp, according to this report, butter shows canary yellow, while oleomargarine is bluish white. Adulterated butter can be detected by the change from yellow to the more bluish color. Whole milk shows yellow, skimmilk shows practically no color at all, and milk which has stood for cream to rise shows a yellow band at the top with an absence of color below the cream line.

Jessie M. Hoover, Milk Specialist of the Bureau of Dairy Industry, and her assistant, Florence L. Hall, have just issued an interesting summary of their work conducting "Milk for Health" campaigns in various places in the United States. An increase of 27 per cent in the milk consumption of the United States is noted. These two workers have taken part in more than 60 campaigns. An average of 12 per cent reduction in undernourishment of school children has been noted in the communities where this work has been done.

The U. S. Treasury has recently announced a decision which sets at rest the controversy over cooking compounds made and colored to look like butter, which have been escaping the oleomargarine tax. It is as follows:

"All vegetable or animal oils or combinations thereof, churned, emulsified, or however mixed, colored to look like butter, crystallized, salted, (or unsalted) and worked, will be deemed to possess a sufficient similarity to butter in flavor, texture, and appearance to bring the resultant product within the classification of oleomargarine.

"All compounds referred to above as being taxable as oleomargarine which are found on the market on and after the effective date of this Treasury Decision will be held subject to the tax."

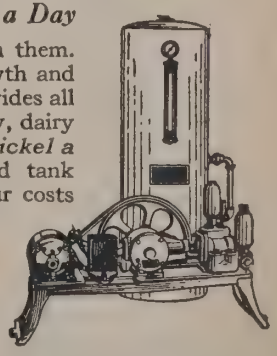
The important feature of this decision is the holding that similarity in "texture and appearance" equally with similarity in flavor to butter brings the product within the scope of the oleomargarine law. This treasury decision is mandatory on all Collectors of Internal Revenue, but obviously their effort to impose the tax may result in further refusal to pay by manufacturers, in which case this would go to the federal courts. In view of this possibility, another case just decided in the U. S. Court of Claims is of great importance. This is a case in which the Jelke concern brought suit for the refund of taxes paid on a fat compound which they held to be a cooking compound but which was as a matter of fact "churned in milk" and therefore which had a flavor similar to the flavor of butter. The court, after a full hearing, rendered a decision against Jelke, holding that the churning in milk was clearly an effort to make the product "in semblance of" butter, and hence oleomargarine, subject to the tax under the oleomargarine law.

The Great EMPIRE Milking Machine

more MONEY from your cows

BECAUSE the calf-sucking action of the Empire Milking Machines gets more milk per day for more days than hand-milking.

BECAUSE one person with an Empire easily does more milking than any two hand milkers.



BECAUSE you can save the wages and keep of a hired man whose work the Empire does—an Empire Milking Machine gives you more milk from your cows—makes dairying a better, more profitable business. Sold on easy payment plan. Send for Empire booklet, "How to Milk for Bigger Profits" —mail the coupon today.

B B MARVEL
CREAM SEPARATORS
More Cream from Every Can of Milk

The permanently balanced, ball-bearing Marvel Bowl assures "all the cream all the time." No neck springs or bushings to wear loose or cause vibration. When you re-run skim milk from your separator through a B B Marvel, you will want the extra cream from every can of milk. Sold on easy payment plan. Write for Empire booklet: "The Latest Development in Cream Separators."

EMPIRE WATER SYSTEM
All the Water You Need for a Nickel a Day

More water for cows means more milk from them. Plenty of water for hogs means faster growth and heavier hogs. An Empire Water System provides all the water you need for the barn, for laundry, dairy and kitchen work, for a bathroom—*for a nickel a day*. Complete Empire motor, pump and tank equipment for supplying 300 gallons per hour costs about what you pay for a top quality radio set—saves work and provides comfort and convenience 365 days in the year. Sold on easy payment plan. Write for "The Empire Book of Better Water Systems."

Clean Milking Means Clean Profits

YOU have doubtless found that few, if any, can be trusted to do your milking as carefully and thoroughly as you would do it.

If milking isn't done thoroughly it isn't satisfactory. There is not only a waste in every milking but cows tend to dry up ahead of time. When figured in terms of dollars such losses are serious in the course of a year.

You can be certain that your milking is thoroughly done when you use a Perfection Milker. The Perfection milks thoroughly because it uses the same natural action as the calf. The new two piece teat cup, besides being easy to wash, milks cleaner, faster and with less vacuum. Low vacuum means contented cows. Contented cows give more milk. They yield freely to the gentle suction and the downward squeeze of the Perfection.

The Perfection milks clean and clean milking means clean profits.

The new 2 piece Teat Cup. One pull and it is all apart for quick and easy cleaning.

A record of fourteen years of successful service is your best guarantee that a Perfection Milker will give you reliable, satisfactory service. Send for a copy of our new catalog.

Perfection Mfg. Co. or **Perfection Milker Co., Inc.**

The "Jay Bee" Humdinger Will Outlast Any Feed Mill Made

Easy Payment Plan

See the Humdinger at work on your farm without cost to you. Prove to your own satisfaction it's the best, fastest, most economical mill made. 4 sizes—7 H. P. to 30 H. P. *Ask about our easy payment plan.*

Heavy steel construction. Practically unbreakable. Lifetime service. No burrs, knives, gears nor rolls to dull or break. No heat, no friction. Does not heat grain. Grinds any hay, roughage, or grain—fine as wanted. No breakdowns. Always dependable. Lowest grinding cost. Unequalled as grinder—feed saver—money maker. Feeding booklet—literature—FREE. Stock in principal cities. Infringements prosecuted.

J. B. SEDBERRY Inc., 268 Hickory Street, Utica, N. Y

Seasonable Live Stock Notes

IT is the beginning of another pasture season in the northern states. The yield of a given pasture depends on many factors. One of the most important of these is to prevent overgrazing. The rate of growth of pasture depends much on the amount of leaf exposure to light. A pasture that is continually grazed down closely to the ground cannot make maximum growth. It is especially important to rotate hogs from one pasture to another as often as the growth indicates a need for relief. The new growth is the part most relished by hogs as well as the best feed for them.

Grain to Cows on Pasture

Our correspondence from subscribers indicates a desire to know how much grain should be fed to dairy cows on pasture. A quick way to answer the question is to feed all the grain the cows will pay a profit on. This avoids wasting grain on scrub cows and gives the good cows opportunity to do their best. Three important factors govern the amount of grain that should be fed. They are (1) the abundance and quality of the pasture available, (2) the condition of the cows, (3) the milk producing ability of the cows. If the pastures are good a capable cow will make a pound of fat a day without grain. Cows capable of producing more than a pound of fat a day must have some grain if they are to continue in good condition and produce all they are capable of producing.

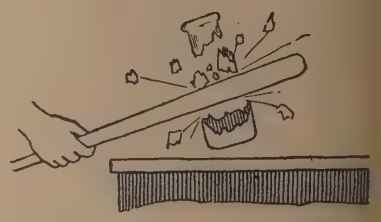
Seed a Little Rape or Sudan Grass for Pasture

It is not too late to put in some rape for hog pasture or some sudan grass for either hogs or cattle. Both are splendid pasture crops and where one is not assured of sufficient grazing from the established acreage small fields not included in the regular rotation, fields near the farmstead may be turned to good account with rape or sudan. Rape is seeded 6 to 8 pounds per acre on a fairly fine and firm seed bed. The seed must not be covered too deeply. Sudan grass may be seeded 15 pounds per acre on a seed bed prepared as for corn. Sudan is ready to pasture about 6 weeks after it is planted. Rape will carry 20 to 25 hogs per acre, sudan 15 to 20 per acre. A good many one,- two,- and three-acre plots near the buildings frequently grow up in weeds. Why not turn these to useful production?

Late Winter Calves Too Young for Pasture

Late winter calves offer a problem in feeding management at this time of year. The temptation is to escape the job more or less by turning such calves on pasture. This is a mistake. These calves are not ready for such a ration. They are not accustomed to eating grass; their digestive capacities have not been developed and are not large enough to handle the amount of grass necessary to supply the nutrients for normal growth even though they could eat enough of such feed. Successful dairymen do not put late winter calves on pasture at all the first summer. They continue them on grain, hay, and skimmilk, giving opportunity for exercise and direct sunshine in a yard near the barn.

Give the Bull Something to Do



To leave the dairy bull confined in his winter quarters is to deprive him of a useful means of keeping fit for effective service. It has been demonstrated repeatedly that exercise is a potent factor in keeping bulls fit. In the swing from the winter routine work to the busy time of planting don't forget to give the bull a fit place for exercise.

Cull Out the T. B. Chickens

What have you been doing this spring and now to keep the new generation of chicks protected from diseases and parasites? Is your flock of mature chickens free from tuberculosis? If not, what are you doing to keep the disease from the baby chicks? These are important questions right now. County agents and poultry specialists who cull thousands of flocks each year will tell you that quite a large percentage of farm flocks have some tubercular chickens in them. It has been clearly demonstrated that tubercular chickens will infect hogs. It is known that the disease is kept alive in the flock by transmission from the older chickens to the young ones that follow in their scratching paths. Now is a good time to examine all of the older chickens in the flock and to remove, kill, and burn those that are tubercular. If you don't know what a tubercular chicken looks like, find out—ask your county agent.

Examine the Fit of the Collar

It is time to examine closely the fit of collar and harness of the work horse. The fit may have been all right at the beginning of the season but, like many things, needs adjustment. Warm weather causes the harness to stretch. As the horses get

Nobody does this to your bottles

THATCHER Bottles

can stand almost anything but wilful intent to break them

ACTUAL experience of dairymen and exhaustive laboratory tests have definitely proved Thatcher Superior Quality Bottles are the hardest on the market to break. But no wonder! They are scientifically constructed to resist breakage.

The use of only the purest flint glass, perfectly tempered in lehrs used by Thatcher exclusively, makes Thatcher Bottles stronger, tougher and more uniform in quality than any other milk bottle made. If you want "more trips per bottle," use Thatcher Superior Quality Milk Bottles. Our Trade Mark is blown on every Thatcher Bottle for your guarantee and protection.

Posters for advertising bottled milk are supplied free to dairymen who will use them on their wagons. Several factories assure prompt deliveries. Write today for samples and prices of Thatcher Bottles.

to the heavier work there may be me change in the size of the neck d condition of the shoulders. Every rse that does his work willingly serves a well-fitted harness.

Castrate Pigs Before Weaning

Young male pigs should be castrat- at about 8 weeks of age and before ey are weaned. To do this shortly ter they are weaned and before they e fully adjusted to their new ration to give them a heavy setback. Ex- eme cleanliness is imperative for ccess both before and for several ys after the operation is performed.

To Prevent Self-sucking

Some cows on pasture develop the bit of sucking themselves. One ay of preventing this and at the me time not interfere with the cow grazing, is to put a halter on her, sten one end of a smooth, stout ck securely in the ring or to the in strap; run the stick between the re legs and fasten the other to a lt placed around the cow's chest.

Time to Set Flytraps

The more flies that are captured d killed during the early part of e season, the less there will be to ntaminate food and antagonize ople and animals later on. The fly- ap is not a cure-all for controlling es; breeding places must also be minated. The flytrap is a great lp if properly placed and baited. Farmers' Bulletin No. 734 of the . S. Department of Agriculture, ashington, D. C., gives descriptions how to make and operate flytraps.

hosphate Pays in Missouri

The average net return from the of steamed bone meal as fertilizer various outlying soils in experi- nt fields in Missouri has been $9.79 each 4-year rotation over a iod of 20 years. The net return m acid phosphate in the same ro- ion but for less time has been 36. The use of rock phosphate shown a net loss of $1.79 for h 4-year period.

When acid phosphate was used h manure the combined net return s $20.81 for a 4-year rotation. e return for manure alone was), leaving the net value of the acid sphate as $10.81. On the same is rock phosphate with manure has wn a loss of $2.93 per rotation.

The Missouri Station ordinarily ommends an application of 250 nds per acre of the 16 per cent l phosphate or its phosphorus ivalent in the 20 per cent phos- te for corn and a slightly less unt for wheat.

arm Building Insulation

OARD'S DAIRYMAN:—Dairymen and k raisers in increasing numbers giving more attention to the fact h a certain percentage of the feed sumed by animals is used to keep n warm. In view of this they are ding their barns, poultry houses, houses, etc., with better con- cted walls to prevent loss of heat n off by the animals. The money t for insulation is saving dollars eed consumed. The stock is more fortable during the cold winter ths and as a result will make e money for its owners. There are he market today various kinds of lating material and lumber sub- tes, some are flexible while oth- are stiff boards or sheets. Each has its particular advantages use. The value of an insulation rial must be judged by its dur- ty and its ability to resist the smission or loss of heat through it. e insulating value of materials for this purpose varies consider- and in view of this care should be exercised in selecting the material used to get one made by a reliable concern whose product has proven its value and has a low heat loss. When selecting an insulating material for the walls of the building to be built or remodeled, consideration must be given to the application so that it will give satisfactory service. Without exception, all good insulating material must be protected from rough usage in order to stand up and give satisfaction over a period of time.

Walls of barns and stables are subject to very rough usage and must be of very durable material. The so-called hard insulation boards will not stand up when used in such buildings as a finish material or sheathing except when used on ceilings or above the reach of animals.

Wood walls are commonly insulated in two ways; one method being to place the insulating material between the studding and sheath the interior with matched lumber as a finish to protect the insulation. Another method is to nail the sheets of insulation to the interior of studding and then apply matched boards over it.

Concrete, stone, and brick walls may be insulated by setting up studding or furring strips against the inner surface, to which the insulation is nailed. Matched boards are then applied over the insulation. New concrete walls often have the furring strips to which the insulation is nailed built into it when it is poured.

For barn ceilings and buildings such as poultry houses where it does not receive rough usage, a stiff insulating board will be satisfactory as a finish without a protective covering. If it is desired to have a better looking job the joints between sheets can be covered with wood strips which will divide the surface into panels and when painted presents a pleasing appearance.

Many of the stiff insulation boards are so constructed that they make a good plaster base and are often finished by plastering directly upon them.

This is a very satisfactory way of finishing the interior of a poultry house.

Wisconsin. THOS. BURTON.

AT LEFT: *Mowing and raking alfalfa in one operation with the Farmall, 7-ft. Farmall mower, and combined side rake and tedder. An ideal combination for speeding up operations and improving hay quality.*

BELOW: *Raking over 100 acres of hay a day. The rakes are dumped by trip ropes. This outfit is used on large acreages and is considered the most economical way of raking hay.*

Modern Haying Calls for McCORMICK-DEERING Power & Hay Tools

THE McCormick-Deering dealer has much to offer you in hay tools and haying methods that turn alfalfa and grass into the greatest profit in the least time. He can show you the new Farmall and the full line of McCormick-Deering Hay Tools that work with it. Or he can show you an equally complete line of horse-drawn tools.

Think of the speed with which the Farmall operator above is turning alfalfa into crisp, air-dried hay. Once over the field and the hay is ready for the mow or stack. That's new haying efficiency.

The same speed and efficiency applies to every operation, whether you favor self-dump rakes, combined side rakes and tedders, or sweep rakes. Mowing, raking, stacking—all are speeded up, resulting in money-saving labor economies and hay that tops the list in feeding and market value. We assure you that your local McCormick-Deering dealer can offer you equipment that will completely satisfy you, whether you operate your farm with horses or power.

Ohio Farms With Electricity

W. A. MILLER, OHIO

SAVING three of four lambs, born on a wet rainy night, by drying them with an electric glow heater has made Wm. Ell, a farmer near Marysville, Ohio, a strong advocate of complete electrification. Mr. Ell is one of 13 farmers on average farms on the Marysville power line, all of whom are co-operating with the Agricultural Extension Department of Ohio State University and are enjoying the many benefits derived from rural electrification.

The Ell Farmstead boasts electric lights in the house, barn, poultry house, and barnyard. There is also an electric percolator, sweeper, cream separator, and latest type modern washing machine. When installing the electrical system on Mr. Ell's farm, B. P. Hess of the Agricultural Extension Department of Ohio State University, in charge of Rural Electrification, located a switch just inside of the door to the rear enclosed porch of the house, as well as inside the second door to the house proper, for lighting the light on the porch.

"I couldn't see why so many switches should be used for one light until the first night Mr. Ell and I returned home after the power was turned on," says Mrs. Ell. "That extra switch beside the first door certainly does help. You know how it is returning home after dark, one must fumble and stumble about until the first light is on, then everything is easy. That outer switch makes it easy right away."

Having had the experience of saving lambs, Mr. Ell remarked to Mr. Hess, "I wish you would get me about 50 feet of wire and run a line over to that little shed over there. I have a sow that is going to have pigs soon and if we have some cold, windy nights I'll just take my little glow heater out there and fix things up."

Stopping at another of the farms we found a dairy barn equipped with light and an abundance of plug-in sockets and switches, as well as an electric milking machine. In the grain crib were grain elevator, feed grinder, and large double feed corn sheller all operated by a five-horse power electric motor. The house on this farm was equipped with a deep well pump and a water softener.

On the farm of J. P. Renner is found an imposing list of electrical equipment including a fireless cooker ironer, fan, percolator, toaster, heater sweeper, washer, five-horse power motor, two-time switches for lights in his poultry houses, a deep-well pump, a shallow-well pump, two brooders of 500 chick capacity each and an incubator of 165 egg capacity. All of this is in addition to complete lighting on the farm. Mr. Renner has water piped from his deep-well pump to five different places besides the house. "I'll never have any more use for the old wind pump," says Mr. Renner.

One of the outstanding features of electrification is the fact that in most instances it brings running water to buildings on the farm and white shining sinks to farm home kitchens. Farmers are discovering that they can pump water cheaper with electricity than they ever imagined possible. One man reports pumping 500 to 600 gallons on less than one kilowatt hour of electricity.

On another of the farms, Albert Raush, the owner, says that with his corn sheller and electric motor he shells all the corn for 39 hogs for one month with a consumption of only four kilowatt hours of electricity.

All of the farms have at least one light advantageously located in the barnyard with switches for controlling it usually located in several different buildings. Feed grinders, considered heavy users of electric current, are used on 12 of the 13 farms. Several of the farms have combination grinder and corn sheller outfits hooked up in various ingenious ways. Two electric refrigerators are being run all winter. Three farms have electric ranges and two more have orders in, so it looks like the old wood pile is eventually doomed.

Electricity, through the medium of rural electrification and the many modern appliances, has and will work wonders in rural communities. The cheery mien of the farmer's wife on the electrified farm reveals the pleasure derived from the use of her drudgery-saving devices.

The Marysville installations are a part of a national rural electrification movement now on in 22 states including Ohio. This movement is sponsored by a National Committee on the Relation of Electricity to Agriculture

From Renter to Owner

HOARD'S DAIRYMAN:—Five years ago John Sims, County Agent of Hillsdale County, Michigan, asked that a dairy record project be started in Woodbridge township. There was no C. T. A. and record keeping was a new idea, but Earl Speith, a renter at that time with a herd of grade Jerseys, consented to co-operate. Jan. 1, 1927, completed five years of record work in his herd. A compilation of his five years' work shows that his herd has averaged six cows in milk for 317 days, with an average production of 6,781 lbs. milk containing 314 lbs. fat per cow. Each year there has been two heifers added to the herd and older cows sold.

After studying his work, and knowing that he had purchased an 80-acre farm two years ago, I asked Mr. Speith to tell me something of his work. He replied by saying, "Wife and I are partners. Such success as we have had is the result of her help and understanding of the problems that confronted me." I found Mrs. Speith helped with the milking when necessary, did her own sewing, and has raised and sold $3,850 worth of poultry and eggs in the past 13 years.

Mr. Speith started farming 1 years ago with an indebtedness of about $1,000. Not being able to buy a good cow, he purchased an open yearling Jersey heifer for $17; sh

MR. AND MRS. SPEITH AND DAUGHTER, ONNELE

vas said to be pure-bred but not registered. This cow, now 15 years old, s mother, grand, or great-grand-nother to his entire herd. During he past year she milked 8,953 lbs. of nilk with a fat content of 394 lbs. At the present time he has 13 head f females, and has sold 15 head.

For a number of years Mr. Speith rove his cows five miles in order to

TURKEYS AT FEEDING TIME

ave the service of a registered Jer-ey sire. He says the neighbors used o laugh at him for going so far. In ne first 12 years $4,800 was paid or cash rental of farm. When the ew farm was purchased two years go they remodeled the barn and Irs. Speith says that the barn will elp fix the house.

Mr. and Mrs. Speith take an active art in community work, have two ildren, and are living comfortably nd within their means. Who wishes o say they are not successful?

Michigan. RAY BAKER.

Dairying in the Yakima Valley

HOARD'S DAIRYMAN:—Our country so far from Wisconsin and condi-ons are so different that we have ought Hoard's Dairyman readers ould be interested to learn some-ing about dairying out here.

Our valley is so noted for its fruit oduction that it is seldom thought as producing anything but fruit. airying is, however, an important dustry. We have a live dairymen's sociation here with one plant in r city and another one fifty miles wn the valley. Besides these there e several privately owned plants d some cream shipping stations.

As you readers probably know, we do not depend on rain for our mois-re in raising any crops. We de-nd almost entirely on irrigation lt on some of the low lands near te streams the water in the ground iso near the surface of the ground tit crops are grown by subirriga-tn. It is on these lowlands that rst of the dairies throughout the lality are operated. Pastures do vll on these lands and water is easi-l obtained for stock watering which i not true on the higher lands where cterns are the only water supply dring the winter months when the irigation water is off.

Do I hear you ask, what do we f d our cows? Alfalfa hay is the nst common and principal feed and cvs do fairly well on it alone, al-tlugh continued good production is n assured.

On our own ranch, or farm, as e tern people would call it, consist-i of 40 acres, there are about five a es in dooryards, barnyards, and w ste land where no attempt is made t raise any crop. There are also fi acres set to young pear trees and tl crops grown between the trees a not used in feeding stock. This l ves about thirty acres on which c produce the feed for our twenty c s, bull, and two mules.

We will use sweet clover in two p tures and bluegrass in the third p and are confident we can raise e ugh corn to make plenty of silage c the cows during the winter. We raised twenty tons of silage per acre last year. We find that cows that have plenty of good silage do not need much hay. We buy alfalfa, using the stack-burned hay if we can get it, as it is cheaper and also better feed. We bought some of this class of hay baled at $10 per ton last fall and later bought some hay in stack at $10 per ton and paid $2 per ton to have it chopped. Besides the hay and ensilage for winter feed we give the cows about 5 lbs. each of mill feed.

Since selling our milk in bottles we have discontinued the raising of hogs but expect to take it up again if we can produce enough pasture for them over and above what our cows take. Hogs can be produced without much grain when we have pasture and can get cull fruit for them. Ground barley is not an expensive feed with us.

Quantities of alfalfa hay are raised in our valley. A good farmer on good land should produce five tons per acre in the three cuttings. Understand me, not five tons in each of the three cuttings but five tons in the three cuttings together. Some produce more than five tons per acre but more do not produce that much.

Climate is a big asset in dairy work here. Last season we pastured for seven months, turning our stock out the first of April and yarding them on November 1. December and January are the only cold and stormy months we have and winds are uncommon during any season of the year. Irrigation is a lot of work but it is also a great convenience to be able to put up hay or any other crop, or do any of the many jobs on a farm without fear of interference by rain or wind storms.

We are selling 180 quarts of milk per day and getting 10c a quart for it. It is rather difficult to make our place pay as we are not on the place and all the help is hired.

Yakima, Wash. H. C. F.

Emmadine Farm, New York, reports that a total of 81 A. R. records have been completed by their Guernseys, less than half of them made by mature cows. The records show an average production of 11,140 lbs. milk, 580.5 lbs. fat. But one cow was fed as much as 12 lbs. of grain a day, and the ration for a majority of these test cows was over half composed of bran, hominy feed, and ground oats.

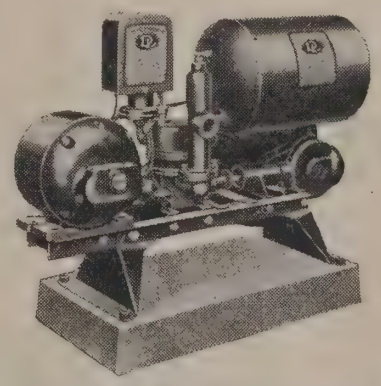
Dependable Running Water wherever you need it—

automatically provided by this Product of GENERAL MOTORS

THE first requirement of an automatic water system on a stock farm is dependability.

The resources and responsibility of General Motors — the integrity of the Delco-Light Company — the experience of over a half million users of Delco-Light products — these are your assurance of dependability when you buy a DL Water System.

And yet DL Water Systems are low in price —as low as $83 f. o. b. Dayton, Ohio. Like other products of General Motors, they may be bought on the General Motors plan of deferred payments.



Let us give you specific information about DL Water Systems. Call the nearest Delco-Light dealer. Or, if you prefer, mail the coupon below for our booklet "Water."

Farmers' Needs

—for Farmers

Farmers today know machinery. Necessity has given them a mechanical bent. They appreciate simplicity of design, excellence of material and mechanical perfection . . . And, knowing values, they buy machinery carefully.

It is not by chance, then, that Graham Brothers G-BOY has enjoyed such marked preference among farmers needing a ½-Ton Truck.

Power from the time-tried Dodge Brothers engine . . . Rugged of frame . . . Heavy duty three-speed transmission . . . Bevel gear final drive . . . Comfort . . . Bodies of various types, box, stake, canopy, all-purpose, stock rack . . . a 1-Ton Truck complete in every detail at a price made possible only by Graham Brothers tremendous production.

Graham Brothers 1, 1½ and 2-Ton Trucks and ¾-Ton Commercial Cars meet 91% of all hauling needs. They are sold complete, ready to work, with bodies to fit any business. Time payments may be arranged.

Your butter will be better

if you rely on Diamond Crystal for the salting

TO develop the full, creamy richness of butter, one need not be an expert, as many farm wives have learned. They rely on Diamond Crystal Salt to perform that function — and the result is better butter.

In creameries, where buttermaking is a business and quality is essential, Diamond Crystal Salt is used and recommended. For forty years now, Diamond Crystal salted butter has been such a consistent winner in the country's biggest competitions that it is unusual for any other butter to win.

In churning for home use, you can achieve the same results if you use Diamond Crystal. The easily-dissolving flakes mix smoothly and evenly throughout the butter, and develop all the flavor and creamy richness, with never a trace of strong or salty taste. Besides, the butter will retain its color and flavor longer.

There is a Diamond Crystal Salt for every farm use — for butter and cheese-making, for table and for cooking, for canning, for livestock, for curing meats. Ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

Diamond Crystal Salt

Free!

We should like to send you a generous sample of Diamond Crystal Shaker Salt and the interesting booklet, "101 Uses for Diamond Crystal Salt," without cost or obligation to you.

DAIRY MARKET NEWS

Twin City March Milk

The Twin City Milk Producers' Association paid $2.50 a hundred for 3.5 per cent milk delivered in St. Paul during March. The Association handled 27,838,457 lbs. milk, of which 53.5 per cent was surplus.

Cream patrons were paid 58 cents a pound for butterfat in first grade cream during March. This is 8 cents above the average price of 92-score butter on the New York market.

April Milk Prices

(From Report by U. S. Dept. of Agriculture)

Table I represents a comparison of the net prices received by producers in 111 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributors' country plant:

Table I—April Producers' Prices by Geographic Sections.

Sections	Range of prices per cwt.	Comparison of average prices 1927 Apr.	1927 Mar.	1926 Apr.

Butter and Cheese in April

The 51-cent average for butter on the New York market for the first 26 days of April gives assurance that the average for the whole month will be the highest on record by nearly five cents, except in 1919 and 1920 when butter reached 62 and 67 cents. That the price seems unduly high to buyers is indicated by the erratic course of the market as shown in the accompanying chart. Butter opened at 50 cents, rose and fell rapidly, and closed on April 26 at 47.5 cents. Apparently buyers felt prices should rule lower, and the market was very sensitive to the supply. April cheese prices declined one cent from the opening price of 23 cents on the Wisconsin Boards, averaging 22.3 cents for the first 26 days. However, the average is only one-tenth cent below March, while it is 3.3 cents above April a year ago.

March Dry Milk

(From U. S. Department of Agriculture)

The wholesale prices given below are based on reports from manufacturers covering actual sales F. O. B. factory du March:

Dry Skimmilk: Prices ranged from cents to 11.5 cents for dry skimmilk in averaging 9.3 cents a pound for sales ing 6,324,616 lbs. When packed in pound cans the price reported was 31.7 a pound.

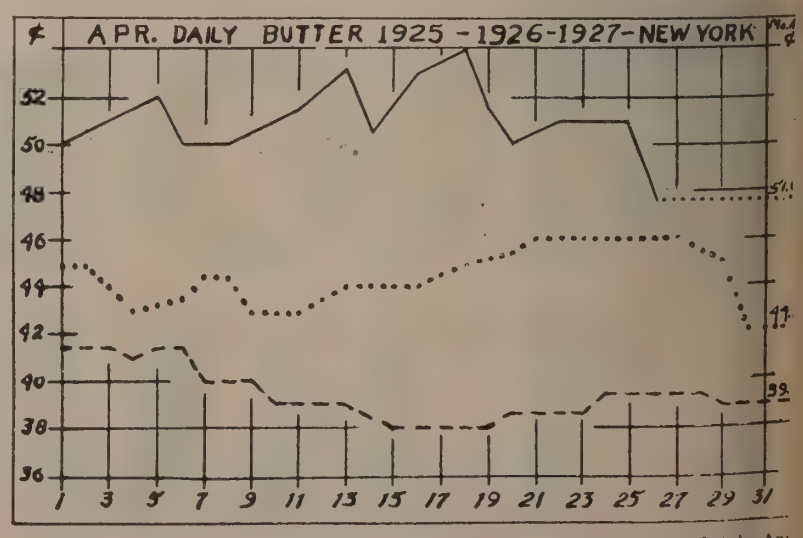
Dry Whole Milk: Prices ranged fro cents to 28.5 cents for dry whole milk, aging 27.5 cents for sales totaling 52 lbs. When packed in one-pound cans price reported was 46.6 cents a pound.

Dry Buttermilk: Prices ranged from cents to 10.5 cents for dry buttermilk in averaging 8.9 cents a pound for sales tot 2,594,715 lbs. When packed in one-p cans the price reported was 10.3 cen pound.

The Wheat Market Situation

(By the Grain, Hay and Feed Market Service, U. S. Department of Agricult

Under the influence of an urgent con ing demand wheat feed prices have made ther advances during the past two weeks though shorts and middlings have been tively weaker than bran. Pasturage has become available as rapidly as appeared sible in March and offerings of most feeds have been only moderate. Less strength i corn markets has also favored slight adva in feedstuffs prices.



Demand for bran has been especially a in the Northeast. Bran on hand at P delphia is quoted about $4 higher than June shipment and Buffalo mills are about three weeks behind on shipping ins tions. Only limited amounts of Cana wheat feeds were available in the Nort both because of slightly restricted grind and on account of the demand for these in Canada. Hardly any bran could be bo at Minneapolis until after the first of but middlings and the heavier feeds were atively easier at that market. Eastern de was active at Kansas City while large were reported to California. Flood condit were restricting inquiry for wheat feeds i South but dealers expected a good trade this territory when transportation difficu should become cleared up.

Linseed meal has been irregular. Offe of 34 per cent meal at the present wr (April 26) are scarce at Buffalo but de at that point was less active for 32 per meal, which was being offered freely prompt shipment. Limited offerings held Chicago market firm but at Minneapolis light production of the local mills was plemented by considerable amounts of from outside points, which resulted in easier situation.

Cottonseed meal has been somewhat aff by flood conditions in the South which have destroyed or damaged some meal prices have been influenced upward. S of cake and meal on April 1 were abou same as on this date in recent years with exception of last year when they were e tionally large. Exports of cake and meal been much larger this year than last but difficult to tell what proportion of e sales were made early in the season prices were much lower than at pr Crushers had around 10 per cent more tonseed on hand on April 1 than a year Demand recently has been slightly more tive and although it is mostly in carlots smaller units it has accounted for a amount of cottonseed cake and meal.

Gluten feed has moved briskly at the r tion to the "grass price" basis. Some o independent mills were practically out o market at Buffalo but the Corn Products pany there continued to offer freely at basis, which carries a premium of 50c for each successive month after Apr which shipment is made. Orders were coming in freely in central western terr

Hominy feed has advanced at most ma in sympathy with strength in the corn

The upper black line represents the erratic course of the New York market in Apr of this year when the supply of butter was very short, the dotted line in the midd the course of the April market in 1925, and the broken line at the bottom the mark in 1926 when the supply of butter was relatively large.

Some export trade was reported at Phil- ia and most of the larger mills were sold Buffalo for the next few weeks although rs at that point were pressing sales of eed, especially in transit and for imme- shipment. Demand was quiet at Balti- but prices at Cincinnati and Chicago affected by the destruction of a large elevator at Springfield, Ill., although the offerings at Cincinnati were equal to t requirements there and demand was at Chicago. Prices advanced $1—2 a t Omaha.

kage continued in fair demand but were reduced $5 a ton at Chicago in with the recent reduction at other ts.

alfa meal continued very quiet. Best s were nominally steady at Chicago and y was very poor at Kansas City al- h manufacturers were reporting an in- d inquiry from feed mixers in central . Texas dealers were expecting new crop to be on the market in that territory in

tations on April 26 were as follows:

	Bos- ton	Buf- falo	Phil- adel- phia	Chi- cago	Min- neap- olis	Om- aha
	37.00	32.00	36.00	31.00	28.25	
ings	36.50	33.00	36.50	31.00	28.00	
. S.						
l	42.00	39.00	39.75	36.50	37.00	35.10
. S.						
l		47.00		49.50	48.00	53.50
feed	36.75	33.50	35.60	29.60	32.80	
ny	33.00	29.50	33.00	28.00		27.00

andard spring bran. Hard winter wheat was $27.75 in Kansas City and $32.50 in nnati, with soft winter wheat bran $30 . Louis and $35 in Buffalo.

April Condensed Milk

U. S. Department of Agriculture)
ces paid producers for 3.5% milk F. O. tory were as follows for April, reports ng those factories manufacturing both and bulk goods:

aphic ion	No. of factor- ies	Range	Aver- age
England	1	$2.30	$2.30
e Atlantic*	12	2.20—2.56	2.41
orth Central	80	2.02—2.30	2.15
orth Central	6	1.75—2.20	2.02

d States	115	1.75—2.56	2.14

ty-three additional factories reported to be based in part on the current 's wholesale butter quotation. Twenty- actories reported prices not determined t and 20 reported plants closed.

nufacturers' wholesale selling prices for ned condensed and unsweetened evap- milk were as follows for March:

	Range	Aver- age
nsed, per case	$5.34—$6.55	$5.93
nsed, per cwt.	9.50—13.00	10.44
rated, per case	3.80— 5.05	4.34
rated, per cwt.	7.50— 9.42	8.58
nsed skim, per cwt.	5.00— 7.00	5.87
rated skim, per cwt.	3.00— 6.45	4.00

wo Wisconsin Holstein Sales

the Lake Mills, Wis., Holstein gnment sale held April 12, 59 brought $8,165, an average of with $395 the top figure. The rs were from Pennsylvania, Illi- and Wisconsin, the out-of-state rs taking about one-third of the ng.

erages for cattle of the different lasses are as follows: Nine bulls, ges, averaged $80; 6 heifers un- wo years, $71; 19 two-year-old rs, $156; 6 three-year-olds, $176; ws four years old or over, $158. and Everson did the selling.

Madison, Wis., the two days im- ately following, 116 head were for $15,770, an average of $136. top price was $270 paid for a typy 5-year-old cow.

erages for the different age es were as follows: Twenty-three averaged $125; 24 heifers under years, $94; 8 two-year-old heif- $133; 8 three-year-old heifers, 53 cows, 4 years old or over, Everson, Krause, and Pohlman he selling at Madison.

The Corn Borer and Good Plowing

HOARD'S DAIRYMAN:—The rapid spread of the European corn borer in Northeastern United States and more especially in the Great Lakes region —Michigan, Indiana, Ohio, Pennsylvania, and New York—reminds us of the fact that the plow has again become the basic tool of warfare against the pest. The grave menace of the corn borer makes every farmer anxious to do the best possible job of plowing.

During the last few years, no farm tillage operation has been more neglected than plowing because we have had tools that would give the surface a pretty thorough stirring even if the plow did cut and cover or leave some stalks on top. Much plowing has been merely a matter of turning the furrow slice up on edge rather than completely turning the soil.

Just a little sketch will show why the corn borer despises the plow operated by a careful plowman. The corn borer passes the winter as a worm hidden in the burrows of the cornstalks. They continue as worms until well along in May when they change to the resting stage. The pupa stage is terminated in late June when the moths emerge and fly during late June, all of July, and the fore part of August.

From a study of the habits of the insect in its various stages it has been found that when stalks which contain the borer are completely covered with soil, the worm comes out of the stalk and works its way to the surface of the soil. If it finds bits of cornstalks or cobs on the surface, it goes into these and completes its life cycle but if no such remnants are found, birds and other predators consume the worms. Moreover, a very little direct exposure to the sun and wind is death to the corn borer.

So it is that the plow is the one tool by which millions of these borers can be forced out of their hiding places and out into the open. And farmers in the infested areas are studying the art and science of plowing as never before. Plowing is an art that every farmer must master.

In general, wide bottom plows do a more complete job of turning under standing stalks than narrower ones. The best jobs I have seen were done with 16" and 18" plows although I am forced to believe that for the other plowing jobs on the farm, narrower plows are preferable. Years ago the jointer was considered an indispensable attachment but later this was taken off as a sop to speed. But now with the imperative necessity of doing a clean job in order to pass the government inspection, the jointer has come back into its own, especially when combined with a rolling cutter. Rolling cutters of large diameter pull easier and cut the stalks better. They do their best work generally when adjusted to about a half inch to the land from the plowshare since this causes the furrow slice to wedge in beside the last furrow when the first fitting tool is put on.

Where cornstalks are light or where they have been pastured, the combination cutter-jointer does a satisfactory job. Where they are heavy, as they are in unpastured fields of the corn belt, there is required still another simple attachment to most satisfactorily turn the trash down. On a walking plow, a chain does better than anything else but the links should not be too large. If the links are too large, they will catch the cornstalks rather than drag them under.

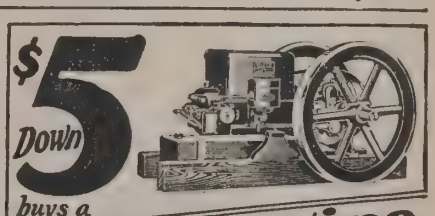
On the sulky plows, three wires attached to the cutter shank seem to do the best work, and in many cases they do better work if the stalks are still fastened at one end rather than when previously cut up with the disc. This will vary some with the plow but in general attaching the wires so they will trail back about equi-distant up and down will accomplish a good job if the wires are so long that the weight of the furrow gives them tension enough to draw the loose stalks and trash up close to the soil.

Three No. 9 wires, each from twelve to fourteen feet long, do the most satisfactory work. Attach one as far down as possible on the cutter shank, attach the next one in the middle and place the top one on the cutter shank but just under the beam. There is on the market a disk coulter—I don't mean a rolling cutter—that combines cutter and jointer functions and will become a very valuable plow attachment in corn borer districts.

No farmer should consider that these details of how to do a more complete job of turning apply only to those who are unfortunate enough to be in the large territory already infested. The fact is that now the pest is on the divide where the water on the north drains into the Great Lakes basin while the land to the south drains into the Wabash, Ohio, and Mississippi river valleys. Even the most ardent believers in the efficiency of quarantine and clean-up doubt that the pest can be kept from eventually invading the fertile acres of the corn belt. We are told by some reputable entomologists that all of us must learn to live with the corn borer and if that is so, then we can best stave off the evil day by doing a thorough job of plowing before it gets to us.

Indiana. I. J. MATHEWS.

Superintendent Gardner of the Holstein-Friesian Association of America reports that the 5-year-old cow, Pansje Prilly Abbekerk, has just completed a 7-day record of 40.39 lbs. fat (50.49 lbs. butter) and 567.1 lbs. milk. This new record breaker was bred by the Bridgford Holstein Co. and is owned by Mrs. Fred Stenzel of California.



Hot sparks—*instantly!*

EVEREADY Columbia renewals are few and far between if you use the engine for a quick start and a steady run. They supply the same sure-fire ignition at any speed. No continued cranking to get going. Bang! goes the engine on the first turn-over.

Reliable battery ignition cuts corners on the first cost and on the upkeep of farm engines. Ignition repairs and Dry Batteries shoot hot, vigorous sparks to Eveready Columbia Hot Shots in their water-proof steel cases. Install them, and no matter how heavy the rain or how wet your engine or battery is, starting is easy and the engine keeps on working until the job's done.

Used all over the world. Guaranteed for a lifetime. Runs on All fuels. Will increase your farm profits $500.00 to $1000.00 a year. Sizes from 1 1-2 to 30 h. p. Also 3-in-1 Saw Rigs and Pump Outfits. Write me today SURE for Free Book and EASY Terms Offer. Witte Engine Works, Dept. 16-45 Witte Bldg., Kansas City, Mo. Empire Bldg., Pittsburg, Pa.

The Laborer is Worthy of His Hire

One time I got some printed figures that had been worked out by a couple of women showing how much a farm woman's work was worth, supposing she was getting paid for it. If she made a plain cake they figured that she had earned so much, just as if she was hired; if it was a fancy cake, it was worth more, and so on.

Shortly after that I was talking to a very intelligent man of wide experience with all sorts of people and I asked him what he thought of my writing something about the value in money of farm women's work with a view to its appearing in Hoard's Dairyman.

"Don't do it," he said instantly. "Let the farm women alone with such ideas; no use in putting fancy notions into their heads about how much they are worth." We passed on to other topics but I couldn't help wondering if he thought farm women were so narrow-minded that the only way to make out with them at all was to keep them in total ignorance of what is going on around them.

I well remember one time when the census taker came to our house years ago. He asked my father this and that when filling out his papers and finally, in a perfunctory fashion, "Your wife has no occupation?" and my father replied, "Oh, no, none at all. All she ever does is to tend seven children, raise chickens, run the house, look out for the garden, help at the church and school, feed the hired men, and a few little things like that but of course from the census point of view she has no occupation and I guess we'll have to put her down that way."

Farm women, as well as other women, should realize the value of the work they are doing, not so that they may become discontented about it and try to start a reform or something, but so that they may find joy in it. Too many people are like the man who, when asked what his youngest daughter was doing, replied, "Nothing. She's just keeping house out on the farm." Now, no woman is going to be very happy doing work that is generally classified as "nothing." She must feel that she is doing something of enough value so that if it remained undone, some life or lives would be the worse for it. That sort of work has value whether the woman doing it ever gets—or wants—pay for it.

Sometime ago I heard a speech by Mrs. Nellie Kedzie Jones of the University of Wisconsin—a woman who has more sympathy and understanding for the problems of the farm mother than any person I have ever known. Some of her facts and figures will be sure to interest you and I am going to give you part of her talk. I am omitting the opening part on budgets for lack of space.

"There are today in this country more than 40 million females, ten years old and over, listed in the census. Of these, more than 31 millions are not listed as being occupied. One of these probably is the farm woman the hired man told about. He was telling a friend about the new place in which he was working. 'The woman turned to me this morning from baking pancakes and said, 'Do you know how many pancakes you have eaten this morning?' 'I told her I hadn't had no call to count 'em and she said, 'Well, this is your twenty-sixth' 'and I was so mad I went right out to work without my breakfast.'

"It may be of interest to know where the women who are listed as gainfully employed are working. There are 1,737 women clergymen, 1,829 women dentists, 7,200 women physicians and surgeons, and 10,075 college presidents and professors. There are 564,000 women stenographers and typists while there are only 50,000 men in the same field and it is interesting to note that in aeronautics there are 1,300 men while only eight women have entered the profession. In short, while there are over 31 million women, over 10 million not listed, there are still large numbers who, even in the census, are given credit for doing productive labor. But is it not productive labor when such meals are prepared and placed before a family of growing children that there results splendid men and women? Is it not productive labor when such meals are prepared for a man that he can carry on the finest kind of labor? Is it not productive labor when a man or woman can so be cared for in a home that every day's work is a joy and pleasure because of good health?

"If a woman spends one hour of a day night and morning milking, should she not have the credit of two hours of hired man's work? When the wage of a household worker is saved by the woman in the home, is that not income and should it not be credited to her? It seems to me very possible to say, when the mother makes a dress for herself or for the children, that it should be credited as productive labor, and so on all down the line. When illness comes, the mother who tends the sick child should be credited with the price of a trained nurse. Whatever she lacks in technical skill, she will more than make up by the love and devotion she puts into her task. Whatever is done in the home in the way of definite tasks, should be credited with the amount that would have had to be paid if the work had been hired done.

"I suspect that in many a home the woman's income, so credited, might be twice that of the man. On many days the farmer does his chores, comes in, and sits down, while the woman goes right on, rain or shine, finding tasks to keep her busy all day and far into the night. Of course, there are a thousand things done by the mother that cannot be credited; first aid for the little fellow who has pinched his thumb; understanding of the boy who has been teased by the neighbor children because he loves his dog; help for the girl who has come to the awkward age and sometimes tries to cover it up by being pert when she doesn't really mean it; smoothing the way for the boy who has come to the age when he is all hands and feet. All these are the special privilege of the mother and no one can ever put a money value on them.

"There are, however, enough tasks through the long day to credit the mother with an appreciable income. If the farmer in his budget is planning to put in his labor at so many dollars a month when calculating the money end of his farming work, there surely is no reason why the wife should not have her work listed in the same way.

"It is not necessary, and perhaps it is impossible, to list such work in the census but the woman in her heart should appreciate that she has given such service. After finishing haying and harvesting when the farmer feels that he has a right to go fishing, his wife should equally well be able to plan for a little release from her 'three meals a day, 365 days a year.' The hay and grain go to the making of better cattle, sheep, and hogs but the regular meals of wholesome food go to the making of better men and women and who shall say that this is not productive labor?"

It was with no intention of making anyone dissatisfied with her work that I decided to write this, but only with the wish to make farm mothers feel that their work has a tremendous value, no matter if they never see a cent in pay for it. It makes my heart ache to see a thing like this happen. I was eating a fine farm-raised and farm-cooked meal, prepared by a plucky but not overstrong mother of several children. At the table there was one of those beasts of men—

Miscellaneous Fashions

No. 2939—Exceedingly Smart. Cuts in sizes 16, 18 years, 36, 38, 40, 42, and 44 inches bust measure. The 36-inch size requires 3¼ yards of 40-inch material.

No. 3004—Slender Lines. Cuts in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. The 36-inch size requires 3⅜ yards of 40-inch material with ⅜ yard of 40-inch contrasting.

No. 3021—Clever Belt Arrangement. Cut in sizes 16, 18 years, 36, 38, 40, and 42 inches bust measure. The 36-inch size requires 3 yards of 40-inch material with 4¾ yards of 1¼ inch ribbon.

No. 3009—Smart Junior Costume. Cut in sizes 6, 8, 10, 12, 14, and 16 years. The 8 year size requires 1 yard of 36-inch material for skirt and 1⅜ yards of 36-inch for blouse.

No. 2639—Junior Frock with Flare. Cut in sizes 6, 8, 10, 12, and 14 years. The 8 year size requires 2 yards of 40-inch material.

No. 2741—For the Smart Matron. Cut in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. The 36-inch size requires 3 yards of 40-inch material with 1½ yards of 20-inch contrasting.

No. 2932—Youthful Apron Design. Cut in sizes 16, 18 years, 36, 38, 40, 42, and 44 inches bust measure. The 36-inch size requires 3 yards of 36-inch material with 7 yards binding.

How to Order Pattern

Enclose 10c in stamps or coins (wrapped carefully) for each pattern ordered. Address your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in the office and, since all orders are forwarded from the factory, kindly allow a reasonable time for delivery of any pattern you order.

We are always pleased to receive suggestions in regard to every department of Hoard's Dairyman.

Destroys Bacteria

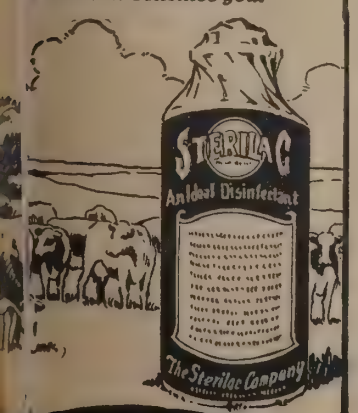
ERILAC is used as a disinfectant to roy the bacteria which make milk and ous other food products spoil. Even ase organisms which are dangerous to lth are destroyed with STERILAC.

eeps Bac- rial Count Milk Low Through the use of STERILAC all external sources of contamination are controlled with the result that milk is produced ing a minimum bacterial count.

erilac Keeps ilk from oiling To insure good keeping qualities milk prepared by the STERILAC method is immediately cooled below 60° F. Such milk is to use as food for infants and children.

Demand Good, wholesome milk is always in demand. The STERILAC method of producing milk will help you to secure a good et for your product. It will help h officers provide citizens wholemilk low in bacterial count.

erilac is eliable You can depend on STERILAC as an aid to produce milk e highest quality. STERILAC is as valuable in creameries, cheese factories, ice cream factories, restaurants, s, butcher shops, hospitals and es. It helps to keep these places scrupuly clean and provides every requirement of sanitation.



erilac Does ot Taint STERILAC is a chloramine substance which is an improvement of the Dakin ration known to destroy bacteria, and mold. It does not taint milk npart an odor. While STERILAC werful it is safe to use as a disinfect- Even if some of the STERILAC on should come in contact with milk or food products it could not spoil them as or humans. That is why STERILAC is use and makes milk, etc., safe food.

rilac is Sold s Powder STERILAC is sold only in the form of a powder. There is no loss in strength on standing. STERILAC solution will keep for a long without losing much of its strength. The STERILAC is small compared with the ced value of the milk and other food cts that are produced through its use as ary agent.

The Sterilac Company
North Chicago, Illinois

that's the only name I can think of that fits—who has the idea that on the farm things just happen without any work. He took a fancy to the red raspberries, canned the summer before, and ate and ate until I wanted to weep, for no woman ever minimizes the work that goes into the picking and canning of such fruit. If this man had had to go and buy a similarly good product in the store he would have whined in protest at the terrible price, for they are very expensive. After he had had his dish filled twice he, in a semi-apologetic fashion, accepted an invitation to have some more and Mrs. A. had to open another can. "Oh, it's all right," she said. "They didn't cost a thing. I had the cans, and the berries grew up in the pasture."

I wanted to say, "No, all they cost was hours of an aching back over the bushes, more hours over a hot stove, strength to turn those lids onto the jars, and pricked fingers that were sore for days, and if you had gone to buy them at a little food shop as I did once you would have paid $1.25 a quart or else you would have done without them."

Your work *is* valuable and things like that *do* cost something though never a nickel of money is spent, and a modest realization of one's worth in the world is one of the finest assets one can have in the way of really productive work.—LUCY THOMPSON.

Neighborly Notes

'Tis Friday afternoon in the country and this means mothers' club in the rural school districts. Let us lay aside our work for today and visit one. Driving up to the schoolhouse early in the afternoon we find several cars there already.

School is not out, but the teacher will be very glad to have us visit school until dismissal. In fact, that is one thing about a mothers' club that the teacher likes so well. The mothers come early and visit school. In this way they learn what the teacher and the children are accomplishing. Both the children and the mothers of the country have needed greatly this contact. Until recently it was a rare thing to have a mother in a rural school visit it. It was all left to the teacher. The parents did not feel that any duty rested upon them after they had hired a teacher and sent their children off each day.

We hear the little ones recite and are astounded at the words they can read and spell. The second graders surprise us with their arithmetic. We hear the upper classes recite history and geography and we are all interested in hearing their current events class. How things have changed since we attended school—and it was not so very long ago either. Now the children sing and we should like to join in the chorus. Gathering up their books they march out in orderly file to the tune of "On Wisconsin" played upon the Victrola.

After they have gone the mothers gather together in small groups and visit for a few minutes. The teacher brings forth some of the children's notebooks for us to look at—notebooks of physiology, history, geography, arithmetic, and a booklet they have made of reproductions of famous paintings and the story of each masterpiece.

The president of the mothers' club now calls the meeting to order and we hear the minutes of the last meeting read and approved. We are fortunate, for this seems to be the day for several yearly reports to be given and thus we can ascertain just what they accomplish in a year.

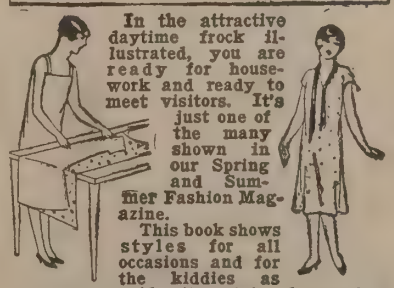
The sunshine committee gives its report and it is surprising the number of plants and cards they have distributed among those sick or in sorrow. They have also given a silver spoon to each new baby born within the district and have sent a sum of thirty dollars to a relief fund.

Several ladies who have attended a convention of mother's clubs and of parent and teachers' associations at the state capital give a report of this convention and bring back numerous new ideas for the home club, ideas they have gathered from these various other organizations and their activities throughout the club year.

Next the secretary gives the yearly report for this mothers' club and we learn that they have accomplished many things, most of which were suggested by the teacher. First they bought and fitted out a medicine cabinet to be used by the teacher for first aid. Often a child is injured while playing and needs first aid badly.

Next they purchased a scale for the children to be weighed upon each month in order to check their weight and height and find who were undernourished. These children were supplied with milk at the noon hour each day.

They had subscribed for a daily newspaper and three magazines for the school children to have for their study.



Probably the most expensive venture had been to purchase playground equipment, consisting of four teeter-totters and six swings. This was something needed very much. Children cannot expect to be kept out of mischief and out of harm's way unless they have some clean, healthful recreation. Next year they hope to add a couple of slides for the children.

The year previous the mothers' club had purchased the Victrola for the school and now the question has

New Fashion Book

In the attractive daytime frock illustrated, you are ready for housework and ready to meet visitors. It's just one of the many shown in our Spring and Summer Fashion Magazine.

This book shows styles for all occasions and for the kiddies as well as you. Also it contains dressmaking hints, an article on Beauty by an expert, an article on the right and wrong thing in dress, etc. It's a book every reader should have. Send 10 cents for your copy today. Address Fashion Dept., Hoard's Dairyman, Ft. Atkinson, Wis.

Kill All Flies! THEY SPREAD DISEASE

Placed anywhere, DAISY FLY KILLER attracts and kills all flies. Neat, clean, ornamental, convenient and cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed.

Insist upon **DAISY FLY KILLER** from your dealer.

HAROLD SOMERS Brooklyn N. Y.

Gallons of
Hot Water
from the
kitchen pump

FURNITURE, floors and woodwork to clean, windows to wash, extra bedding to "do." Make house cleaning easier with lots of hot water! There's a simple way.

Quickly, Too

Connect a Perfection Kerosene Water Heater with your kitchen pump. With our new method you can pump either hot or cold water. Just light the burner. In 5 minutes there's enough hot water for shaving, in 10 minutes enough for washing dishes, in 30 minutes enough for washing, scrubbing or a bath.

Not Expensive

Four models—reasonably priced. Two have thermostats which put out the flame when the tank is hot. One has a 30 gallon "Stay Hot" storage tank. This keeps the water hot for 36 hours after the flame is out. They all burn kerosene—the cheap fuel. All work equally well if you have running water instead of a pump.

Free Booklet

Ask your plumber or write for full description and prices.

arisen of the purchase of a piano. Quite a discussion takes place but it seems they actually need one as the old organ has wheezed out its last tune. Finally it is put to a vote and they decide to buy one.

While the two ladies who serve are preparing their lunch, the other ladies discuss how they will raise the money to pay for the piano. Many ways are suggested. One lady tells how an adjoining district has put a water system into their school and paid for it by serving hot oyster suppers in the winter and having bazaars. Another school raised their money by food sales. Still another raffled off two quilts, and another had given a series of card parties and charged so much a person. Another lady suggests a box social and still another that an entertainment be given some evening at the school with special music and a good speaker. The latter they decide to adopt and charge admittance and then after the program they will serve a free lunch. A committee is appointed to attend to the details of this and secure a prominent man to speak if possible.

The teacher has a few things she wished to talk over with the mothers and she seems to appreciate so much the opportunity to meet the mothers in this way. This concludes the business and the meeting adjourns.

The lunch is delicious—chicken sandwiches, angel food and hickory nut cake, and coffee. Everyone present is taxed ten cents and after shaking hands with the teacher and other ladies we take our departure.

Eggs for Supper

Of all the great variety of products from which the busy housewife can choose the evening meal, nothing has greater possibilities from the standpoint of easy preparation, economic efficiency, and nutritive value than eggs.

Eggs are usually considered a breakfast dish. They are, however, coming to be used more and more as a main course for supper. Omelets, especially, are most attractive for an evening meal. Here are a few egg receipts for supper which show how attractively and easily supper requirements may be met by using eggs:

French Omelet:—4 eggs, 4 tablespoons milk, ½ teaspoon salt, ⅛ teaspoon pepper, 2 tablespoons fat. Beat eggs slightly, then add the milk and seasonings. Put fat in a hot omelet pan; when melted, pour in the egg mixture and cook slowly. As it cooks, stir with a fork until the whole is of a creamy consistency. Place on hotter part of stove to brown quickly underneath. Fold and turn on a hot platter. Before folding, grated cheese, chopped meat, jelly, etc., may be added.

French Omelet, Spanish Sauce:—2 cups tomatoes, 2 onions (chopped), 1 green pepper (diced), 3 tablespoons fat, ½ teaspoon salt, ½ teaspoon sugar, ⅛ teaspoon pepper. Melt fat, add other ingredients. Cook 10 minutes. Spread half the mixture over half the omelet, fold, place on platter and garnish with remainder of sauce.

French Omelet, Onion Sauce:—2 onions (chopped), 3 slices bacon (diced), 2 tablespoons flour, 1 cup milk, ½ teaspoon salt, ⅛ teaspoon pepper. Brown the bacon slightly, add the onions and cook slowly 10 minutes. Now add the flour and seasonings; when blended, pour in the milk and cook until it thickens, stirring constantly. Place the folded omelet on a hot platter and garnish with the onion sauce.

Plain or Puffy Omelet:—4 eggs, 4 tablespoons water, ½ teaspoon salt, 1-16 teaspoon pepper, 2 tablespoons butter. Separate yolks from whites. Beat yolks in a small bowl with a Dover egg beater until thick and lemon-colored; add salt, pepper, and water. Beat whites on a large platter with a wire egg beater. Pour the yolks over them and carefully fold until the mixture is blended. Melt butter in an omelet pan and pour in the mixture. Spread evenly, place on a range where it will cook slowly for 15 minutes. The last minute the fire may be raised to brown the bottom. Place in a hot oven a few minutes to cook the top. it is firm to the touch the ome done. Crease across the top and Serve at once.

Grated cheese, minced ha jelly may be placed on the omel fore it is folded.—National P Council.

No. 2832—Afternoon Frock. Cuts in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. The 36-inch size requires 3⅜ yards of inch material with 3¼ yards of banding.

No. 2806—Long Waisted Dress. Cuts in sizes 16, 18 years, 36, 38, 40, 42 and 44 inches bust measure. The 36-inch size requires 3½ yds 36-inch material.

No. 2978—Smart Sports Dress. Cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. The 36-inch size requires 2¾ rds 40-inch material with ¾ yard of 40-inch contrasting.

No. 2804—Smartly Shirred. Cuts in sizes 16, 18 years, 36, 38, 40, and 42 inches bust measure. The 36-inch size requires 2½ yard of or 36-inch material with 1 yard of 40-inch contrasting.

No. 2805—Smart for Many Occasions. Cuts in sizes 16, 18 years, 36, 38, 40, and 42 inches bust measure. The 36-inch size requ yards of 40-inch material with ⅝ yard of 40-inch contrasting.

No. 3012—Box-Plaits Give Distinction. Cuts in sizes 16, 18 years, 36, 38, 40, 42, 44, and 46 inches bust measure. The 36-inch size qu 3⅛ yards of 36-inch material with ⅞ yard of 36-inch for camisole.

No. 3013—Particularly Pleasing. Cuts in sizes 16, 18 years, 36, 38, 40, and 42 inches bust measure. The 36-inch size requires 1¾ rds 40-inch material with 1½ yards of 18-inch contrasting.

No. 3014—Becoming to All Ages. Cuts in sizes 16, 18 years, 36, 38, 40, 42, and 44 inches bust measure. The 36-inch size requ yards of 40-inch with ¼ yard of 27-inch contrasting material.

No. 3015—Distinctly Sports Version. Cuts in sizes 16, 18 years, 36, 38, 40, 42, 44, and 46 inches bust measure. The 36-inch size requ yards of 40-inch material with ⅜ yard of 36-inch contrasting.

To order any pattern illustrated, send 10 cents to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Be sure to state nu and size and write your name and address plainly. When you order your pattern, enclose 10 cents extra and our new Fashion and Dressmak Book will be sent to you. It contains hundreds of styles, picture dressmaking lessons, embroidery designs, etc.

EDITORIAL COMMENT

FAR-FETCHED FEAR

To increase the returns of the dairy farmer and to keep production within consumptive demands we advise selling cows that do not pay for feed consumed. It is not good business for any man to milk cows that do not pay him as much for feed as it can be sold for to the elevator. In many instances we recognize that the poor cow is due to the poor way in which she is handled and fed, but we also know there are cows incapable of returning any profit regardless of what the prices of dairy products may be and such animals we advise selling to the butcher.

We were taken to task for this advice some time ago and this question was asked: "What will you say if so many of these poor cows are sold that there is a genuine shortage of dairy products and perhaps our babies can not get sufficient milk to supply their needs?" To us this is a far-fetched fear but we answered it as though the condition which our friend anticipated might happen. In the first place we said to him that there is no danger the owners of all the poor and inefficient cows will follow our advice; and, secondly, when the prices of dairy products become sufficiently high we can increase production from 20 to 25 per cent by simply giving cows better care and better feed. When we have this reserve and when prices warrant increased production through better feed and care of dairy herds, we need not fear a shortage of dairy products.

MORE MILK WANTED

According to reports, J. W. Slocum, president of the New York Dairymen's League, has urged Commissioner Harris of the New York Health Commission to permit the price of milk to advance one cent per quart. The purpose of the advanced price in milk is to stimulate production in the season of short supply.

The New York milk shed is not producing all the milk necessary to supply the city of New York and evidently Mr. Slocum considers it a mistake to ship milk long distances in order to get a sufficient supply during the season of low production.

We believe he is right in this contention. It is evident, however, that he has failed to read the addresses of certain congressmen and articles by proponents of the McNary—Haugen bill. Several of these persons have shown by statistics that the lower the price of a farm commodity, the higher the production. In other words, if production is to be stimulated in the New York milk shed, according to the arguments of certain persons, a lower price should be paid for milk.

It is perhaps just as well that President Slocum has not seen these statistics showing that low prices stimulate production, for it might be very disconcerting to him. It is our opinion he had better remain in his present state of ignorance and urge that milk be advanced one cent per quart if it is desirable to stimulate production of that product.

TO STOP TICK ERADICATION

How anyone in the present light of live stock knowledge could be opposed to the eradication of the cattle tick is difficult to understand. This insect has caused thousands of animals to suffer and spreads Texas fever among cattle wherever it exists.

Some years ago it was discovered that cattle tick could be easily eradicated by dipping cattle and by keeping them away from fields infested with ticks. Dipping destroyed the ticks on the cattle and by keeping the cattle away from the pasture, the young ticks starved to death. Thousands of square miles of territory once inhabited by the tick and inflicting suffering upon the cattle and loss upon their owners, have been cleaned of this scourge. However, we find men in the country where the tick exists, still favorable to its existence.

A bill was recently introduced in the Florida State Legislature proposing to abolish the state live stock sanitary board and, incidentally, to put an end to the eradication of the cattle tick in Florida. In discussing Senator Hodge's bill, the Pensacola Journal says:

"It is inconceivable that a man of his mature years, one who has lived in Florida for many years and has seen the struggles of those working for the best interests of the state to build up the cattle industry, should attempt to nullify the program that is making it possible for cattle raisers to pursue their business to best advantage.

"Not only are Florida cattle bringing better prices than formerly, but it soon will be possible to import thoroughbred dairy cows and develop the dairy industry throughout the state."

PRICE AND SURPLUS

According to a statement in the Illinois Agricultural Association News Service by Mr. A. D. Lynch, director of marketing, the average price for butter was 49.4 cents for March, 1927, or 8 cents higher than March, 1926. The report attributes the 8 cents a pound less for butter in March, 1926, to the 26,313,000 pounds of butter which were in the warehouses of this country at that time. We are quite willing to admit that the higher price for butter in March, 1927, is due in part to the small quantity of butter in storage. The higher price was also due to lower production of butter, to the tariff, and to other causes.

If we used the same character of reasoning that is evidently exercised in the statement made in the News Service, we would say something like this: On December 1, 1926, we had 64,377,000 pounds of butter in storage. The highest quotation for butter on the New York market for December was 56 cents, and it averaged for the month 54.8 cents, or 5.4 cents higher than in March, 1927, when less than 8,000,000 pounds of butter were in storage for that month. In other words, the more butter we have in cold storage, the higher the price, and the foregoing figures show that this is true. This, of course, is a false conclusion but it shows clearly how imperfectly many people reason concerning things that influence price.

After Mr. Lynch says that the farmers received 8 cents less per pound fat for cream in March, 1926, than they did in 1927, he draws this conclusion: "This is one of the clearest illustrations of what surplus control provided for in the late McNary—Haugen bill could do for farmers and the nation's prosperity. This small quantity of storage butter could be given away at a bargain price, or dumped into the lake so the one billion pounds consumed could have brought five or ten cents per pound more."

How does Mr. Lynch know the consumer would have paid ten cents a pound more for one billion pounds of butter? Some dairy farmers are now consuming oleomargarine because they think butter too high in price.

The butter market has been fluctuating, due to the fact that the handlers of butter fear the consumer will not buy the supply at the present quotations and the danger of increased production due to high prices. In other words, the price of butter has been as high as it is possible to keep it and still consume the butter produced. The little in storage has been very largely a stabilizing force which is not at all injurious to the dairy industry.

Let us see what happened in the fall of 1925. Butter sold on the New York market for about 52 cents a pound wholesale, and retailed at 58 to 65 cents a pound. This caused consumers to curtail consumption. In the last three months of 1925, 22,000,000 more pounds of oleomargarine were consumed than in the last three months of 1924 when butter was cheaper. The normal consumption of butter did not take place until about May 1, 1926, when its price was about 40 cents. The fact is, when prices of butter go beyond what the consumers think it worth, the cocoanut cow of the South Sea Islands comes in with her product larger quantities.

For the year ending June 30, 1909, the total co sumption of oleomargarine was 89,337,664 poun or about one pound per capita; for the year en ing June 30, 1926, the total consumption was 23 166,482 pounds, or a little over two pounds p capita. Grant that if the McNary—Haugen b had been in operation, the prices of butter wou have increased. This means more oleomargari would have been consumed and a larger supply surplus butter. Is this an advantage to the dai industry of this country? This brings about con tions for lower returns to the dairy farmer a many concrete instances can be cited to prove th More dairy products are being consumed per ca ta and at higher prices than ever before in t history of the dairy industry, due, in part at lea to educational campaigns to inform the public their food value. The last year or two there h been a slight decrease in per capita consumpti of butter in this country, indicating its price h reached a level that curtails consumption and t increased consumption of oleomargarine also in cates this. Would it be to the advantage of t dairy industry to have this continue further wh butter is selling relatively higher than at any ti in the history of dairying, except in the years 1919 and 1920 when the price of labor and fe made the production less profitable than it was 1926?

It seems to us that instead of putting into op ation a law like the McNary—Haugen bill wh would impose an equalization fee upon all butt whether produced by the poor or the good cow, it better to dispose of the cows that are not pay for their feed consumed and are only surplus p ducers. This is the simplest and the most effect way of keeping prices of dairy products on a pr itable basis. Also let us keep up the work of e cating the consumers to the importance of but in the diet so that they will willingly pay a f price for it.

FARM RADIOS

The radio has made it possible for every fa home to come in direct contact with the affairs the world. It seems to us the radio must m more to the farmer than to any other citizen. brings him music, information concerning his bu ness and discussions on subjects of national imp tance, advises him concerning the weather, a brings stories and lullabies to help send his you children to dreamland.

It is evident the farmer appreciates the ra for, according to the United States Department Agriculture, there are now 1,252,126 fa equipped with radio receiving sets. On July 1925, there were little more than a half million dio receiving sets on the farm. At this rate it not be many years before every farmer will hav receiving set and it will be possible for one per to talk to the entire farm population of t country.

The radio is something that passes human derstanding and makes us wonder what will be next great invention. It is difficult to conceive anything that would be of more value and en tainment than this invention which can pick m and speeches from the air. We accept all this a matter of course and give little heed to its won ful mysteries and the enjoyment that it bring those who live on the farm.

In a survey made by the United States Dep ment of Agriculture to gather facts concerning desires of the farmer, it was found that they fer radio talks to music nearly two to one. untary comments accompanying the formal swers indicate a strong dislike for jazz. In mu they want old-time tunes and classical music.

Aside from educational farm programs, weat and market reports, political talks are evide popular and more current news programs are demand.

U. S. National Holstein Sale

At the second U. S. National Holstein Sale held April 25—29 at Oconomowoc, Watertown, and Waukesha, Wis., 371 Holsteins from herds in seven states were sold to buyers from twelve different states and Canada. It was a good sale, well managed, that deserved even better support from Holstein buyers than it had, for if any man wanted to buy black and white cattle, he had an opportunity here to purchase good ones at very fair prices.

The Blue Ribbon sale held at Pabst Holstein Farms, Oconomowoc, on the 25th was properly named. The consignments there were unusually good, perhaps too uniformly good for the buyers to appreciate them all. Certainly it seemed as though buyers generally got full value for their money and some of them more than that.

Sixty-eight head, exclusive of small calves, were sold for $42,390, an average of $623. Fourteen bulls, three of them small calves, averaged $781 and the females averaged just over $522. Seven head, four females and three bulls, sold for four figure prices. Two of the bulls went over $2,400 and one to $3,600. The top of the sale, appropriately Catalog No. 1, was a 7 months' old son of the 1178-lb. 4-year-old cow, Bess Finderne Pride Fayne, sired by a 1,000-lb. grandson of Colantha Johanna Lad. He was consigned by Dutchland Farms, Massachusetts, and purchased by A. M. Dunn of California.

The second animal in the price list, Bell Farm Honor, is a well bred senior yearling bull from Bell Farm. He is from Bell Farm Bakker, a show winner as well as a 1,000-lb. producer and sired by North Star Ozone Champion. "Honor" went to A. C. Hardy of Ontario for $2,450.

R. V. Rasmussen of Illinois took several of the best females including Bell Farm Susie, the top priced cow, at $1,875. She is a 35-lb. 4-year-old herself, is by a son of Mabel Segis Korndyke and from Susie Abbekerk Colantha (White Susie), 35-lb. 1,113-lb. cow that was reserve All-American in 1923.

The sales at Watertown and Waukesha were intended for the purchaser who wanted first class cattle but did not want the high record unusually good ones that very properly command high prices, and those last 4 days of selling saw a very good lot of good Holsteins go through the ring.

The entire 371 head averaged $271. The 303 head sold at Watertown and Waukesha averaged $192, with 3 head going for $500 or more, two of them bulls that sold for $775 and $7[illegible] respectively. One of these, a [illegible]-ar-old, 953-lb. son of Iowana Sir Ollie consigned by Philip Linker, Wisconsin, went to the Detroit Creamery Farms of Michigan. The other was Dodge County Homestead Boy, a 6-year-old grandson of S. P. O. M., purchased by Christ Mayer, Wisconsin.

Haeger, Mack, Kelley, and Wood did the selling. The sales were managed by Haeger, Baird, and Dacey.

Following is a list of those animals selling for $500 or more and buyers:

[illegible]. Dunn, California	
[illegible]utchland Bess Quality	$3,600
[illegible]r Puls, Wisconsin	
[illegible]rilly Lyons Vassar May	$ 800
[illegible]eneral Homestead Mercedes 6th	1,100
[illegible]ar Farms, Missouri	
[illegible]von Echo Daisy	$875
[illegible]rmsby Korndyke Pauline Segis	800
[illegible]egis Sindt Flora Butter Girl	600
[illegible] Johnson, Illinois	
[illegible]urton Avon Viola	$505
E. A. Baker, Massachusetts	
Wisconsin Mercedes Fobes Ormsby	$ 750
Pearl Mooie Ormsby	1,500
Pietje Girl De Kol	715
H. E. Dickinson, Wisconsin	
Dora Ormsby Fobes	$720
R. V. Rasmussen, Illinois	
Bell Farm Susie	$1,875
Pabst Creator Ella Spofford	500
Bell Farm Cleopatra	620
Bell Farm Soldene	650
M. B. B. Beauty	1,675
A. C. Hardy, Canada	
Bell Farm Palmyra	$1,500
Bell Farm Honor	2,450
Swartz—Muckleston & Baird, Wisconsin	
Bell Farm Valor	$630
Detroit Creamery Company, Michigan	
Daisy Queen Fobes Ormsby	$500
Walcowis Sir Ollie	775
Knauf & Tesch Company, Wisconsin	
O. K. L. P. Abbekerk	$520
H. E. Shadle, West Virginia	
Ormsby Sensation Abbekerk	$540
Carnation Milk Farms, Wisconsin	
Avon Echo Viola	$900
Miss Alice Inka May	500
Waldholm Farm, Wisconsin	
No. 62	$625
Christ A. Mayer, Wisconsin	
Dodge County Homestead Boy	$750
E. M. Bayne, Michigan	
Juliet Sunnybrook Ormsby	$500

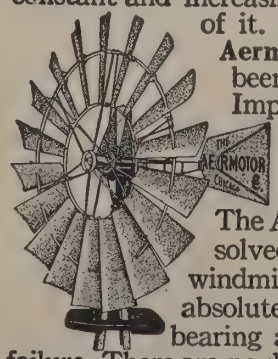
You Can Depend on a NASH

C. W. NASH has devoted a lifetime to the manufacture of motor cars.

His cars always have had a reputation for dependability, because of the way he builds them.

Years from now, the Nash you buy today will be sound and roadworthy.

The engine will be smooth, quiet, sweet running. Not alone because the crankshaft is properly supported by 7 big bearings, but also because of full force-feed lubrication directly to all those 7 bearings and to *every other* engine bearing as well. A constant, positive film of oil wherever metal works against metal.

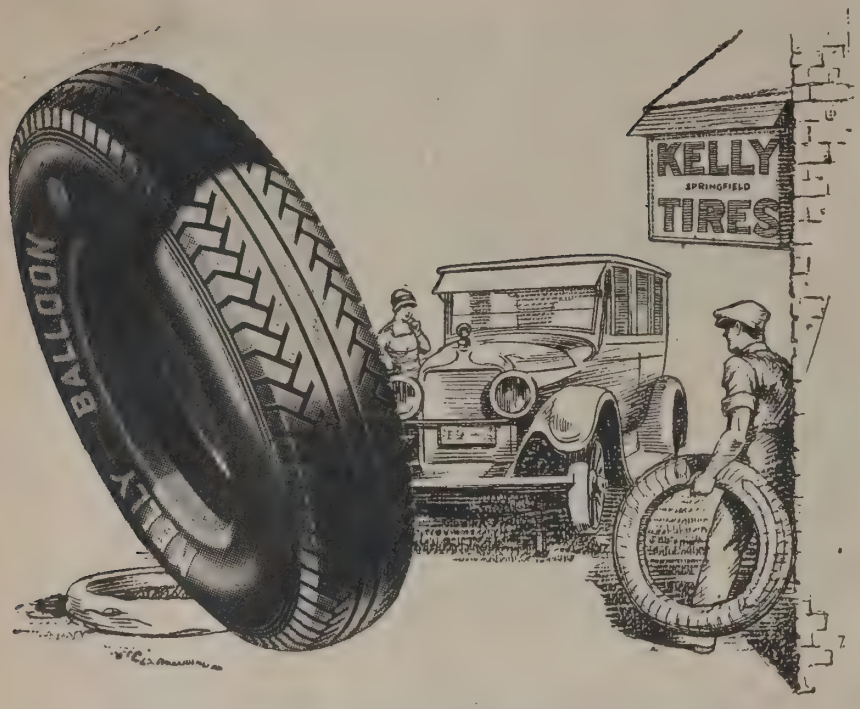


Nash bodies, also, are more durable. They are built on an exceptionally well-braced hardwood frame, and the Nash chassis is built with *tubular-trussed* cross members to protect the body from road strains.

The car illustrated above is the Advanced Six Four-Door Sedan. It is a big, luxurious 5-passenger car—very safe, with Nash Two-Way, 4-wheel brakes and Budd Michelin steel wheels—and very powerful, with the Nash 6-cylinder, 7-bearing Valve-in-Head Motor and the Nash Straight Line Drive. It is complete in every detail, even to Watson Stabilators in front, *without extra cost.*

See this Nash and drive it before you buy your new car. It is a long-lived, money-saving motor car! (5786)

A WONDERFUL SUCCESS



"Nothing succeeds like success," they say, but where success is constant and increasing there must be some unusual merit back of it. The continued success of the **Auto-Oiled Aermotor** is based entirely on merit. It has been made better and better year after year. Improvements have been added as experience has shown the way. The **Auto-Oiled Aermotor** of today is a wonderfully durable and efficient windmill.

The Aermotor Company, more than 12 years ago, solved the problem of complete self-oiling for windmills in such a way as to make the system absolutely reliable. The oil circulates to every bearing and returns to the reservoir with never a failure. There are no delicate parts to get out of order. The double gears run in oil in a tightly enclosed gear case.

A Vest Pocket Herd Book is a good investment

Car owners expect more from Kellys–and they get it!

MORE people are buying Kelly-Springfield tires this year than in any year during the company's history.

The reason is not far to seek. The tires Kelly is building today are by far the best that ever have come out of the Kelly factory. This statement is not mere talk; it is an undeniable fact, as thousands of tire buyers can testify.

Car owners have learned to expect more from Kellys, and they are getting it—this year to an even greater extent than ever before.

Yet Kelly-Springfields don't cost any more than most other tires.

"Kelly dealers everywhere—there must be one in your town"

Seasonable Live Stock Notes

THERE has been a rush to get the seeding done and the corn in the ground. In that rush to give crops the advantage of seasonal timeliness there may have been a tendency to neglect little things that promote the best welfare of live stock. The pigs may get sore mouth, calves may get the scours from moldy feed or dirty feeding pails, cows may have been turned out to pasture too soon and their grain feeding neglected, shell forming material may have been neglected in the poultry ration and the production suddenly drops, poorly fitted harness may have caused sore necks or shoulders on the hard pressed horse. After corn is planted and before cultivation begins is a good time to check up on the things that may have been neglected in the press to beat the inclemencies of an unfavorable season.

Mineral Matter for Calves

Skimmilk and legume hay go a long ways in supplying enough of the essential minerals for calves. If one wants to make certain that the calcium and phosphorus requirements of calves are fully met, the feeding of one or two ounces per head daily of finely ground sterile bone meal will suffice. It is convenient to feed it with the grain. Salt should be provided after calves are well accustomed to grain and hay. Calves under 3 months of age should never be forced to get the greater part of their feed from grass.

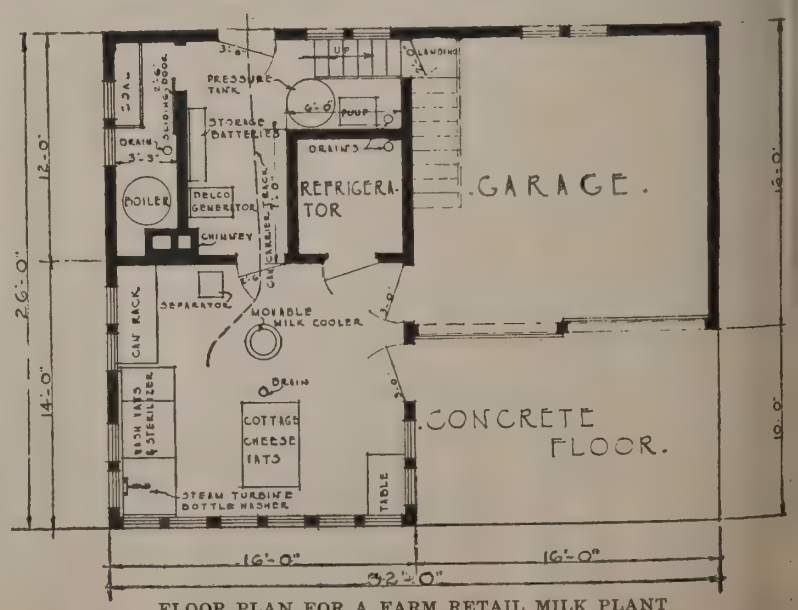
Grain Mixture for Cows on Pasture

For the month of June while the pastures are at their best, the grain mixture for high producing cows may be very simple and it need not contain over 12 per cent of digestible protein. Such a mixture could be made of 200 lbs. of ground corn or ground barley or ground sorghum grain or hominy feed, 300 lbs. of ground oats, 100 lbs. of bran, and 50 lbs. of linseed meal or cottonseed meal. The amount to feed is governed by the quality and quantity of pasture available, the level of the ability of the production of individual cows, and the condition of cows. One pound of grain for each 5 pounds of milk produced is liberal feeding.

Mineral Mixture for Cows on Pasture

The best time to feed the essential minerals to cows has not been positively determined. Scientific investigation indicates that if there is any best time it is in the summer pasture season when the cows have access o fresh green pasture and when tl y get a maximum of direct sunshine f the greatest quality. The essen l minerals to feed have been fairly v ll determined. They are calcium, ph - phorus, chlorine, and, in certain s - tions, iodine. We suggest giving e dairy herd free access to a sim e mineral mixture composed of eq l parts by weight of salt, finely gro d limestone, and bone meal during e summer season.

Amount of Skimmilk to Feed P s



A little attention at this time i f year to the amount of skimmilk d to pigs goes a long ways in gett g the greatest return for such f d. Some farmers pay little attention o this. They have so much milk to s t rid of and they dump it in the g trough and forget about it. Just f - ter weaning, from 4 to 6 pounds o f skimmilk to each pound of grain i s sufficient to make maximum gain i n dry-lot feeding. Pigs on past e need only about half this amoun o properly balance the ration.

Remove Cockerels Early

If one is interested in getting h best development possible in h pullets from a hatching of chi s the cockerels should be separ e shortly after one is able to iden f them. Profitable production o winter eggs depends to no little x tent on how well the pullets are e veloped. Late hatched pullets r handicapped in this respect. E l hatched pullets should not be allo e to lose this advantage by poor m agement in their development. e move the cockerels.

To Expel Long Round Worms f Pigs

If pigs are infested with wo n (the long round kind) the so e they are removed the better. W expellers may be made as foll s Give in capsule 2 grains of santo i 1 grain of calomel, 1 dram of a c nut, 1 dram of sodium bicarbo t for 100 lbs. live weight. Hav druggist prepare a mixture as s the above proportions, then have h mixture put into capsules in the r h quantity for the sized pigs to b treated. Another good expeller s be made by mixing 128 ounce o castor oil, 8 ounces of oil of Ch o podium, and 8 ounces of chlorof m Give one ounce to a 50—60-po n pig and 1½ ounces to a 100-po n pig. Pigs should be held off feed o 24 to 36 hours before being tre s

FLOOR PLAN FOR A FARM RETAIL MILK PLANT

The work room provides facilities for bottling milk and cream, for making cottage cheese, and for convenient storage in the refrigerator. The boiler room conveniently provides space for boiler, coil, lighting and water systems, and pump. The garage houses the automobile and milk wagon. If desired, the building may be extended to two stories to provide a farm office over the work room, with a bedroom back of this and storage room over the garage.

Milk Cooling Tanks

When milk is cooled by well or spring water, a minimum net width of 24 inches is recommended for the tank, but in case either iced water or mechanical refrigeration is used this width may be reduced to 19 inches. The tank is made only deep enough to permit water to come well up on the necks of the cans. To lighten the labor of lifting cans in and out of the tank, part of its depth is below the floor level. The length is variable, depending upon the capacity desired.

If ice is not available, milk usually can be cooled to 55 degrees Fahrenheit or lower by circulating spring or well water through the tank. A uniform flow of water is secured by

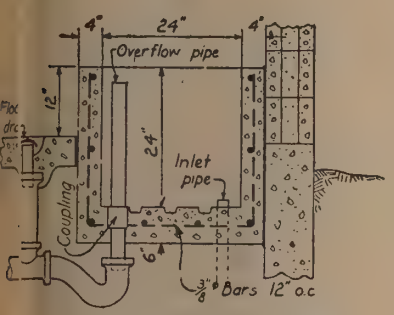


FIG. 1—CROSS SECTION OF TANK

placing the inlet pipe at one end of the tank and the outlet or overflow pipe at the opposite end. The overflow pipe screws into the outlet drain and is equal in length to the depth of the water desired. The grooves in the tank floor permit water to circulate freely under the cans, resulting in more rapid cooling of the milk. These grooves are made by pressing wood strips in the concrete at the time the floor is finished. Before the concrete has hardened the strips are removed.

When the tank shown in Figure I is to be built, the floor and walls are concreted in one operation. The floor of the tank is made 6 inches thick and the walls, 4 inches. Reinforcement consists of ⅜-inch rods spaced 12 inches apart. The reinforcement of the floor and walls is made continuous by bending the rods "U" shaped. Rods are also extended around the tank walls, with ends lapped at least 12 inches. At all intersections reinforcing rods are firmly wired together to hold them in correct position.

A 1:2:3 concrete mixture for both type of tank is considered most satisfactory. Use screened gravel or crushed stone up to 1 inch in size.

The Insulated Tank

Figure II shows details of an insulated tank in which corkboard is used as the insulating material. The concrete base below the corkboard may be not less than 3 inches thick and placed first after the reinforcing rods are arranged in place. Two-inch corkboard mopped with hot asphalt is then laid on the base, also mopped with hot asphalt. The corkboard for walls is dipped in or painted with hot asphalt at the same time. Coal tar pitch may be used if asphalt is not available. Wooden forms for both the outside and inside walls of the tank are placed next and 2-inch corkboard for wall insulation is erected, making certain that all abutting edges between sections are thoroughly covered with asphalt. Corkboard must be braced to prevent displacement. Outside and inside walls are made the same thickness as the lower base of the tank—3 inches. Forms are then filled with concrete of a consistency that will place readily. A sloppy mix should be avoided. Bolts to which wooden plate or rail around top of tank is to be attached are placed in top of walls. The concrete base of the inner tank is placed next, making it 4 inches thick as is shown in Figure II.

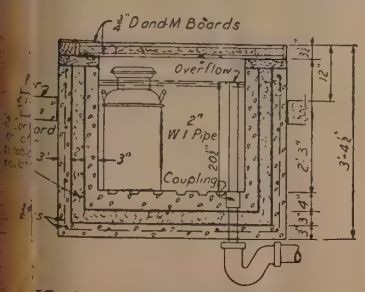

FIG. 2—CROSS SECTION OF INSULATED TANK

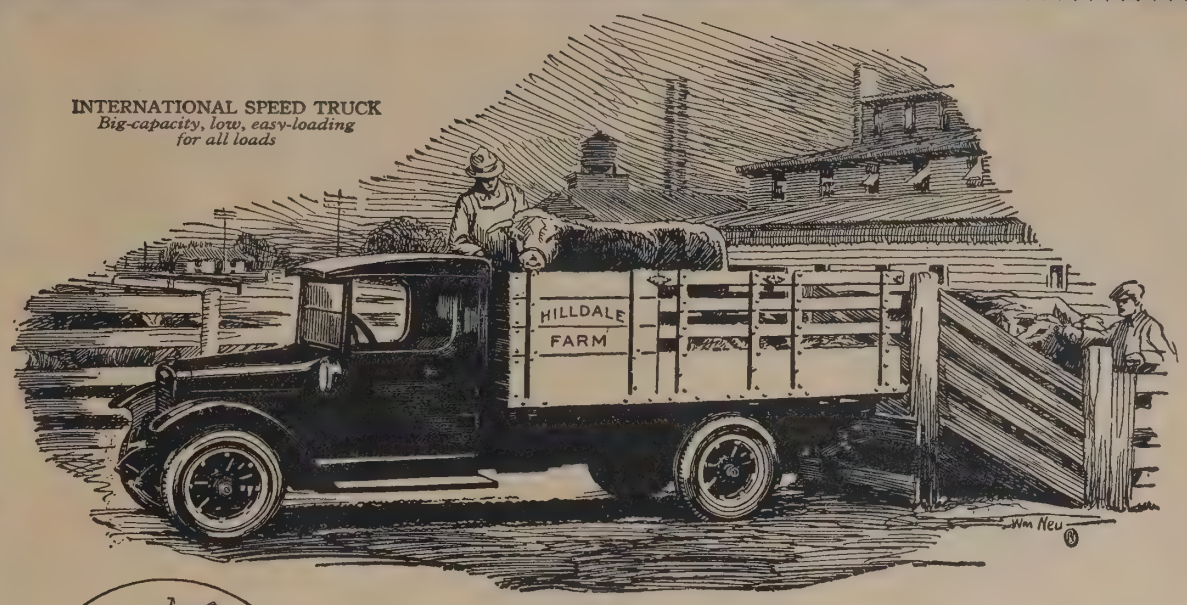

When mechanical cooling is employed use inch corkboard for insulation.

Mechanical refrigeration may be easily installed. An opening for the coil may be made in the wooden rail or in the concrete wall of the tank, according to manufacturer's directions. If it is desired to build the tank so that mechanical refrigeration may be employed at some future date, it would be well to provide an opening for installation of the coil. This hole may be filled with a wooden plug until the cooling apparatus is installed. Three-inch corkboard insulation is recommended when tank is built for mechanical refrigeration.

The wood cover for the tank should fit snugly and be of rigid construction to prevent warping. The framework is covered with dressed and matched boards after corkboard has been placed in the frame. The cover is fastened in place with galvanized hinges and should be thoroughly painted on all sides and edges.

Placing the Floor

Where the ground on which milk house is to be located is sloping, the area should be leveled off and tamped so that the entire floor rests on firm soil. A 5-inch floor made of 1:2:3 concrete is generally used, with stone or gravel not larger than 1½ inches in size. One-course construction is recommended which means that the full thickness (5 inches) of concrete is placed in one operation and thoroughly tamped. A dense, even surface is produced by smoothing with a wood float. A little 1:2 mortar may be used in finishing, if needed. —Portland Cement Association.

INTERNATIONAL SPEED TRUCK
Big-capacity, low, easy-loading for all loads

International 3-ton Truck in the dairy business, owned by Harry Marsh of Carlisle, Ia.

Eighteen farmers at Swift Current, Sask., Canada, are using International Speed Trucks, with grain bodies, as above.

Begin this year to Profit with this Truck

WHEN you come to buy the motor truck that will put your farm hauling on a fast modern basis, remember that INTERNATIONAL HARVESTER *is equipped to help the farmer as no other organization can!*

International Trucks range from the light International, the ¾-ton "Special Delivery," up to the big 5-ton Heavy-Duty unit. They include the most complete line of Speed Trucks on the market, both 4 and 6-cylinder, for 1¼ and 1½-ton loads. If the truck you want is a handy, economical, long-lasting truck for loads of moderate size, one of the Speed Trucks will suit you to a "T."

International in every size is a quality truck—big value at its price. Bodies for every kind of farm load, comfortable riding, with sturdy chassis and ample dependable power for hauling loads over road and field.

Then, SERVICE! You know International Harvester service—it is rendered in fullest measure to International Trucks. We maintain 126 Company-owned Motor Truck Branches and Service Stations in the United States, a wonderful organization of service ready to help any owner meet any emergency. Branches and dealers always close at hand.

Haul your loads four times as fast, do each half-day's hauling in an hour—so you can get back to your fields and livestock where your *profit* is waiting to be made. Let an International help you. *Write us for a Catalog.*

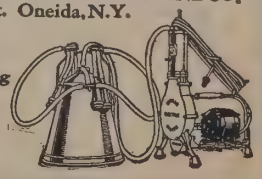
The HINMAN Electric

A smoother, sweeter-running little machine you never saw!



Just a handful. Move it anywhere. Plug in, attach teatcups. How it milks! Listen closely or you can't tell it's working. One or two cows at a time. Just *watch* the hard work being done for you—time and money being saved.

Easiest to clean. Only 1/6 H.P. required. Low in first cost. Because it uses the *Simple Hinman System*—proved right by *19 years* of success in America, and in Belgium, France, England, Australia, South America and other foreign lands.

If you have electric power, choose a Hinman Electric and the future will confirm your judgment.

HINMAN MILKING MACHINE CO.
2nd St. Oneida, N.Y.

HINMAN
PORTABLE GAS ENGINE • STANDARD • PORTABLE ELECTRIC
MILKERS

The famous Goodyear Pathfinder. Car owners have already bought nearly 5,000,000 of these lower-priced, standard quality Goodyears.

Not in any catalogue

One of the biggest safeguards of low-cost tire mileage is not to be found in any catalogue.

That is the helpful *service* performed for you by the local Goodyear dealer.

He doesn't merely sell you a Goodyear Tire and let it go at that. He sees that you get the right size and type; he mounts it on the rim; he fills it with air.

This is worthwhile service, saving you effort and time; but his biggest contribution comes *after* the sale.

As long as that Goodyear Tire is in use he helps you give it the care it should have in order to deliver the best results.

This money-saving service is available in your home town, as part and parcel of the Goodyear policy: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that users can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced Goodyear standard quality Pathfinder

Opinions, Brickbats, and Bouque

These columns are open to the readers of Hoard's Dairyman for the expression o their opinion on any subject, whether radical or conservative, destructive or constructiv wise or foolish. It may be cows or crops, religion or politics, or what at the time mo interests you. It may be critical or commendatory, but it should be your opinion. It your own editorial page but your editorial must not exceed 250 words. Hoard's Dairyma assumes no responsibility for opinions expressed.

Getting at the Milk in the Cocoanut

HOARD'S DAIRYMAN:—So much has been said recently about "farm relief" that I am somewhat like Will Rodgers, I believe the farmer has been relieved of about all he has to be relieved of.

As I see the matter, it all resolves back to the two things, producer of raw materials and producer of finished products. Almost always it costs much more to produce the raw material than to produce the finished product, but invariably the finished product sells for many times more than the raw material. The farmer is wholly a producer of raw materials, hence his low prices and financial embarrassment.

It takes a whole year to produce cotton, wheat, and other crops and he sells his wheat at approximately 1½ cents per pound and in one day's time that same wheat can be converted into bread for which he has to pay ten times as much for as he got for it.

He sells his cotton at approximately twenty cents per pound which can be converted into cloth at very little expense and a few days' time into cloth for which he has to pay from $1.50 to $5.00 per pound.

He gets about six cents per pound for his hides which, with present day machinery, cost less to tan than to skin the cow and only about twice as much to manufacture into shoes and other leather goods as it costs to skin the cow, but the farmer has to pay from $2.00 to $6.00 per pound for the finished product made from the hides.

The source of all wealth comes from the farm but not to the farmer. Here is my solution but it does not solve the whole problem, but as I see it, offers a plan by which it can be solved.

Let every farmer, when he finds a short cut to production, advertise the way he did it as in the case of J. Howard Cliffe of Pennsylvania who wrote in Hoard's Dairyman April 10 and explained how he made a short cut to harvesting corn for the silo.

Let us help one another and not depend on designing politicians to get us relief, or get us "relieved."

Missouri. CHAS. CROW.

Keeping the Sabbath

HOARD'S DAIRYMAN:—I have been a solicitor and reader of Hoard's Dairyman for a number of years and expect to continue so long as I remain a breeder of Guernsey cattle. We find it more than mere interesting O. B. B. We are inspired to better living, better service, and better returns are the results. So we wish you continued success.

The truth is what made us free. We appreciate the truth in deed as well as in spirit. Therefore, it gives me pleasure to submit the following Bible teaching about the true Sabbath:

Sabbath means rest. Six days may work be done; but in the seventh is the Sabbath of rest. Ex. 31:15. There is no questioning that under the Mosaic dispensation the seventh day of the week was the day set apart by Jehovah as a holy Sabbath.

There is no evidence whatever that anyone had knowledge of or kept the Sabbath before the time of the exodus from Egypt. Moses wrote Genesis 2:3 many hundreds of years a creation; so, when did God bless sanctify the Sabbath Day? Ans "I caused them to go forth ou the land of Egypt.....Moreover I gave them my Sabbaths." (E 20:10:12.) "And remember thou wast a servant in the lan Egypt, and that the Lord thy brought thee out thence;....th fore the Lord thy God comma thee to keep the Sabbath d (Deut. 5:15.)

The New Testament Sabbath is the keeping holy of any parti day but is a state of soul-rest. C tians, however, have followed th ample set in apostolic days (20:19-20; 20:26; Acts 2:1; 2(hence, during all the years and turies from Pentecost down to own day they have met together worship on the first day of the —"the Lord's day" (Rev. 1:10)

Pennsylvania. E. N. LYDI

Keeping Young

HOARD'S DAIRYMAN:—About years ago I wrote you about pla Japanese walnut trees as an in ment for nuts and timber. That I planted a few and sold a few t neighbors. One lot I saw a few ago and some of them were o inches through and had one-h bushel of nuts on three of the t last season. That looks to me the farmer who will plant a acres, like a good investment. make fine shade trees if wante that purpose. For timber I c say how its quality for furn would compare with our Ame black walnut, but no doubt it v be quite valuable. The nuts ar eating and it's a well known f pound of nuts is worth at least of the best beef. If we eat more and less meat we would live l and have less trouble while l As the years go by you will n the price of nuts have gone up, more than doubled, and will ke going up as the people learn th ue of them as food.

A gentleman was in our city days ago and gave a lecture on to live. He said we should l least 150 years instead of 37, th erage span of life, and the rea we do not live as nature intend to live. He gave as a sample h live, himself. Twenty-five year he was given up by the best do They said there was no help for So he called in another doctor another school of medicine ar said the first thing was a fast least 30 days. He took it, th entirely different diet was pres which he has rigidly followed and today you would think h most a spring colt although 78. said when starting on the 30-da he had such a bay window he h seen his feet for 5 years, but it gone and he can kick out the ch liers. While on the platfor kicked as high as his head. He nuts as a part of his diet. So not grow a large part of them. years ago I looked into the n dustry and found at Syracuse, one orchard of 3 acres. I di find the age of the trees but year $3,000 was taken in for th son's crop. They were black nuts.

Wisconsin. JAS. H. BIRCH

Substitute Crops for Oats and Corn

HOARD'S DAIRYMAN:—Today the weather bureau at Fort Wayne, Indiana, announced that there has been more than six inches of rainfall during April, 1927. The normal for April is but 2.91 inches, hence it appears that over a considerable area the April rainfall has been more than double the ten-year average.

And taking a look about over the area which includes some counties inside the corn borer quarantine line and some without, it is quite apparent that farmers are going to have to be thinking about substitute crops for the oats and corn which they ordinarily plant. Careful estimates are that not over two per cent of the normal oats acreage has been planted and not over 30% of the cornstalk ground of 1926 has been plowed under. And it should be remembered that all this land is ordinarily sowed to oats by this time. Even the oldest residents can scarcely remember when they sowed oats in May. The picture in the two paragraphs above is as of May 1.

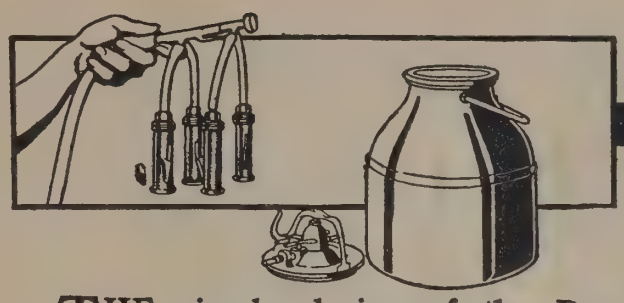
Even the most optimistic concede that it is humanly impossible to get more than 70 per cent of the stalks turned under together with what sod ground is usually put to corn by the first of June, hence the problem of determining early the most desirable of the alternatives is in season since whatever course is charted, seed must be purchased and other plans made.

Interest is quite keen in varieties of corn that mature in less time than those ordinarily planted. State entomologist, Frank N. Wallace, contends that the advent of the corn borer into the corn belt will necessitate that farmers grow earlier varieties of corn that can be planted later in the season. This has point when it is known that the corn borer moth seems to prefer to lay her eggs on corn that is from a foot and a half to two feet high. In the past, the infestations have been much worse on corn that height than that smaller. In the minds of the uninitiated, we should well revert to flint corn but the Canadians have found that this is not good advice since the flint corn generally has a smaller stalk, hence is seriously injured by a fewer number of borers than the most stocky growing dent corn. But this year, there is quite a portion of the corn belt that will plant early maturing dent corns such as Golden Glow and Wisconsin No. 12 in June, rather than plan substitute crops.

Among the substitute crops that give most promise for the dairyman and the stockman, none offers more than soy beans. True, the past two falls have been very discouraging to the soy bean grower but some of the difficulties which have been experienced can be overcome by different methods of sowing and the use of different varieties of beans. The fact of the matter is that the soy bean, while in itself a very valuable crop, has never found its exact niche in corn belt rotations. If sowed in rows, it competes with corn for time in cultivating and if sowed to hay, it runs into the usual unseasonal rains when haymaking is over and that out of season. If grown for seed, difficulty of curing and cost of threshing are drawbacks.

The farmer who has a rotary hoe can fill his soy beans solid, using from four to six pecks of seed to the acre and then cultivate them twice or three times with the rotary hoe. In this way, he will have clean beans and get away from the competition of corn. Perhaps the Manchu has better reputation than any other single variety both for yield of seed and hay. Those who have tried this variety rather generally like it better than the Ito San. From present indications, the Dunfield is to be the coming bean because of its habit of not shattering either in the late fall or winter. Last fall, several farmers who had planted Dunfield soy beans were able to cut their beans with mowing machines and thrash them the same day and such a thing could not be done with any other variety. And then, if the soil should be too wet for teams to get on the field, hogs and sheep can gather the beans during the days in the winter when the ground is frozen. This gives them an appreciable amount of high protein feed, at the same time inducing them to get that exercise which is so essential in winter.

In the territory which is under the corn borer quarantine now, general practice on most farms is to have some permanent pasture. And on the whole where permanent pasture is all that is provided for summer feeding, there are generally about six weeks in July and August when the picking is rather slim. Those who experience this difficulty can turn some of this late plowed soil into milk by planting it with sudan grass. This substitute would have a limited use but five or six acres on each farm would work in very well. This can be sowed in June and would furnish some pasture in late July and August.

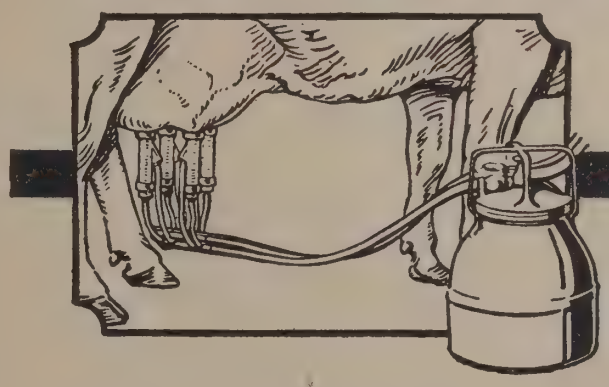


There is quite a large part of this territory where a limited acreage of navy beans could be planted to good advantage except that they would require cultivating.

With the weather as it has been, it seems that this should be THE summer for live stock men to plant alfalfa. Alfalfa seed is relatively low in price, limestone and fertilizers are at about as low a level as they have ever been, and there is much to lead one to believe that alfalfa planted now would be a long time investment that should yield very satisfactory returns. In fact, at the present, the only men in this territory who can see another shower coming and still look pleasant are those who have a relatively large acreage of alfalfa, sweet clover, or grass land.

Some of this land will, of course, be fallowed during the summer and sowed to wheat and rye next fall but everything indicates that a fair portion of this, at least, should be sowed to alfalfa.

Indiana. I. J. MATHEWS.



The De Laval Milker is Easy to Wash and Clean

THE simple design of the De Laval Milker makes it extremely easy to wash and to keep clean. With a brush, some hot water and a few minutes' time, the entire machine can be thoroughly washed. The few parts requiring any washing at all are illustrated above. There are no seams in which dirt can accumulate, or crevices to harbor and provide breeding places for bacteria.

Hundreds of producers of Grade A and Certified Milk in every section of the country declare the De Laval Milker an invaluable aid in the production of clean milk, and an assurance of regular premium money.

This is but one of the advantages to be had with a De Laval for it soon saves enough time to pay for itself and will milk your cows better.

Facts about the De Laval Milker

1. **650,000** cows now milked the De Laval Way.
2. De Laval Milkers now in their eleventh year of use.
3. **83.27%** of the users report average saving of 2 hrs., 12 mins. per day.*
4. **97.13%** of the users say it agrees with their cows.*
5. **99.4%** of the users say they get as much or more milk as by hand milking.*
6. **9.49%** average increase in production per cow reported by those who have records.*
7. **94.80%** of users say their De Laval is easy to keep in a clean and sanitary condition.*
8. Average bacteria count of all reporting, **14,542**—**62%** report counts of 10,000 and less.*
9. **96.45%** of De Laval users say their milker is "the best," "one of the best," or a "good" investment.*

*Based on reports from 1844 De Laval Milker users in all parts of the U. S. and Canada.

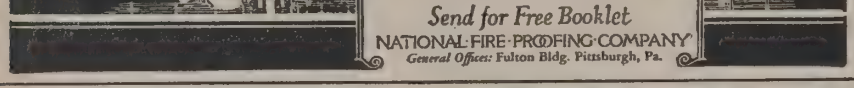
"When I Drive These Last Two Red Tops I Will Have Built My Fence Over In Three Years!"

JUST drive in a RED TOP Steel Fence Post alongside a rotting wood post, fasten the same fencing to it with the RED TOP handy fastener and *that* post job is done for many years. It is the simplest and easiest and most economical way to replace posts. Adds many years of service to the fence you now have. Gives the farm an orderly and business-like appearance. Adds to its value. Makes intensive farming practicable and profitable. Saves a lot of valuable time each Spring that is usually frittered away on repairing and re-stapling fences and replacing rotted and broken wood posts.

Red Top
GUARANTEED
Steel Fence Posts



RED TOP Steel Posts are not only best for replacements but should be used when erecting new boundary or cross fencing. They hold the fence perfectly and permanently, outlasting 4 or 5 ordinary wood posts. Easy to install. One man with the RED TOP One-Man-Driver can drive 200 to 300 posts a day regardless of the condition of the soil. The work can be done at odd times. The next time you are in town throw on a load of RED TOPS and take them to the farm. When you have a couple of hours replace a few posts and note the improvement in the fence line. You'll never notice the slight cost. RED TOP Steel Drive Fence Posts reduce a week's fence building job to a little more than a day.

With the RED TOP Post Driver, one man can drive 200 to 300 posts a day

Ask the RED TOP dealer to show you this guaranteed Post. Note aluminized, weather-resisting finish that adds to both the appearance and life of the post.

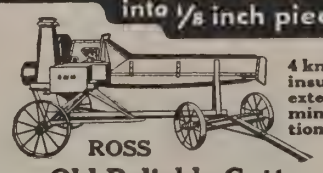
GEHL *Lightest-Running* **SILO FILLER**

Low speed means less power required, less vibration, hence longer life. The Gehl has all steel construction, non-breakable, boiler-plate fly wheel. Absolutely self-feeding. All gears enclosed—run in oil.



What a University Test Proved
A Gehl cut 19.26 tons per hour with only 13.26 H.P., elevating 35 feet and running 465 R.P.M. —the lowest power of any cutter in the test. It will do as well on your farm.

Auto Type Gear Shift for changing length of cut. Wonderful no-choke blower fills highest silos with low speed—3 H.P. and up will run Gehl cutters. **Dealers everywhere** — Write for name of nearest dealer.

Wayside Musings Unity in the Home

JOSEPH S. MORRIS, WISCONSIN

IN the Bible story of Jacob and Esau we note this statement: "Now Isaac loved Esau and Rebeka loved Jacob." There was a division in sentiment and that division was bound to spell trouble. Nowhere else in life is greater tact, caution, fairness, and love more essential than within the home. The spiritual union of the home rests upon mutual trust and mutual love. When the sentiment of the home divides and more is given to one of its members than to another, unhappiness generally follows.

We have a saying that "blood is thicker than water," meaning by that that we are expected to stand by and to defend all the queer, unreasonable, unjust, and stubborn actions of those who are kin to us because of this "blood is thicker than water" idea.

The fact is, that genuine love within the home must be corrective. The member of the family, whether it be son or daughter, who seems somewhat different and more difficult to discipline, is in all the greater need of understanding and sympathetic love. It is quite easy to favor the one who seems most pleasing to us but we dare not forget the needs of all. The world is a hard place for those sons and daughters who have been allowed to go on with their objectionable ways until those ways have become deeply imbedded in character. Certainly we shall always be more or less bound by ties of blood and that fact gives us the strongest reason in the world for trying to tactfully, understandingly, sympathetically, and sometimes sternly loving the members of our home into the kind of beings who will make it possible for us to own the relationship with pride.

It seems to me that Jesus of Nazareth gives us a fine idea of what is meant by spiritual unity. He had been busy dispelling evil spirits from people and his enemies accused him of being the prince of these evil spirits because he was able to cast them out. Jesus said to his accusers, "You are wrong; every house divided against itself shall not stand; if I were the prince of the demons I would not be casting out those who belong to my own house. Be consistent; the unity of the home is a unity of spiritual likeness in tastes, ideas, thoughts, expression."

Of course, the great hope for the spiritual unity and peace of the home ought to be looked to before the initial step is taken in the establishment of the home. It is pitiable to se people whose ideas, tastes, ideals a as far apart as the poles entering u on the enterprise of building a hom Sometimes people differ radically their religious views. They ought stop and consider whether there any possibility of compromise or a justment. Religious differences a exceedingly difficult of adjustmen Again we find one of the partners the marriage compact very religiou faith means everything in the wor to this one while the other party the proposed union may be dispos to scoff at the idea of religious fait So soon as the first enthusiasm wedded life is gone they will be fa to face with the reality of their e tirely different ways of thought a life. Should children come into su homes, and come they do, need v wonder if there is not that spiritu unity, peace, and love that is so e sential to the best development children?

Of course, two thoroughly reaso able and fair-minded people m succeed in composing their differe es and it is a splendid exhibition manly and womanly courage when is done. Sometimes the father quite willing to let the mothe splendid influence have its way. have known some men who, thou they themselves never took any pa in things religious, were very ca ful to permit no word to be said th would in any way weaken the wo being done by the mother to have t children grow up with a sweet a happy faith. I admired these m very much but I am constrained wonder what the difference mig have been had these men found possible to step out and set the e ample for their sons and daughte

Love is a wonderful thing and it truly remarkable that human bein do so well in the great sphere of t home. The tragedies come in t homes where there is no capacity f adjustment. We cannot overlook t fact that children are specially sen tive to what I shall call lack of sp itual unity. We may be very clev but we are not clever enough cover the fact that there is not th sweet accord that shows itself in t look, the manner, the day-in-and-da out little courtesies that are so l in their significance.

And yet, tragic as is the case of home of divided affections, there not much that outsiders can do better the case. There is nothi that is in worse taste than "m dling." Men and women must fi their own way to spiritual unity.

ATTRACTIVE FARM HOME OF D. M. YOUNG, ILLINOIS

THE FARMER'S POULTRY HOUSE

R. M. HOOPER, Manitoba Experimental Farms

DURING the past decade there has been considerable development in the poultry industry in estern Canada. Coupled with this velopment has come improvement in ethods of feeding, management, id housing.

The old time poultry house in which e poultryman sought to provide armth for the laying stock during nter, is becoming a thing of the st and is being replaced by houses which more emphasis is laid on yness and abundant supply of fresh r. In the old style of house the at-mpt was made to retain the heat nerated by the birds in order to aintain the heat of the house. Fowl nerate very little heat in compari-n with other classes of live stock, d very little circulation of fresh air uld be allowed. A well constructed use under this system could be kept asonably warm but the air would evitably become foul or stagnant, nich is not conducive to health in e flock. Houses that are capable of ing kept warm by the animal heat nerated usually have few windows. here little or no circulation of fresh r is allowed the house will very soon come damp. Damp houses with in-equate light and poor ventilation, nether warm or cold, will inevitably ing disease of some kind.

Colder, But Drier and Healthier

The new type of house in which ovision is made for ventilation is mewhat colder than the old style, t better results in winter egg pro-ction are obtained. It has not been oved that hens will lay better in d houses than in warm ones, but it s been amply demonstrated that esh air and dryness in the house are sential to health, and health is a ime factor in egg production. The sults of investigation in the ques-n of proper housing indicate that ds kept in the fresh air type of use not only produce more eggs ring winter but the fertility of eggs ring the hatching season is in-eased and the vigor and vitality of e flock and the chicks are improved. here provision is made in the hous-g of poultry to keep them healthy, better results will be obtained and greater profits made.

While there are no hard and fast rules as to general type or dimensions of house, there are certain principles of construction that should be followed in order to insure the house being adequately lighted, well ventilated, and dry. Briefly, the essentials in construction are: the slatted ceiling, the straw loft, and the glass and cotton front. While no definite size or type of house can be stated to be the best for all conditions, the houses shown in the accompanying illustrations are most highly recommended for farm conditions in Manitoba.

A BROODER HOUSE

This picture shows the brooder house at the Experimental Farm, Brandon, Manitoba. With the exception of the roof, the construction is the same as the "Farmer's Poultry House." The space between the ceiling and roof does not allow sufficient space for straw for mature birds in winter.

These houses are sixteen feet wide and thirty-two feet long. One partition is made in the center, making two pens sixteen feet square. Each pen will accommodate fifty birds. Where it is desired to have smaller matings in the spring each of the pens can be sub-divided and four pens of twenty birds each accommodated. A few details of the construction of a house of this type may be of interest.

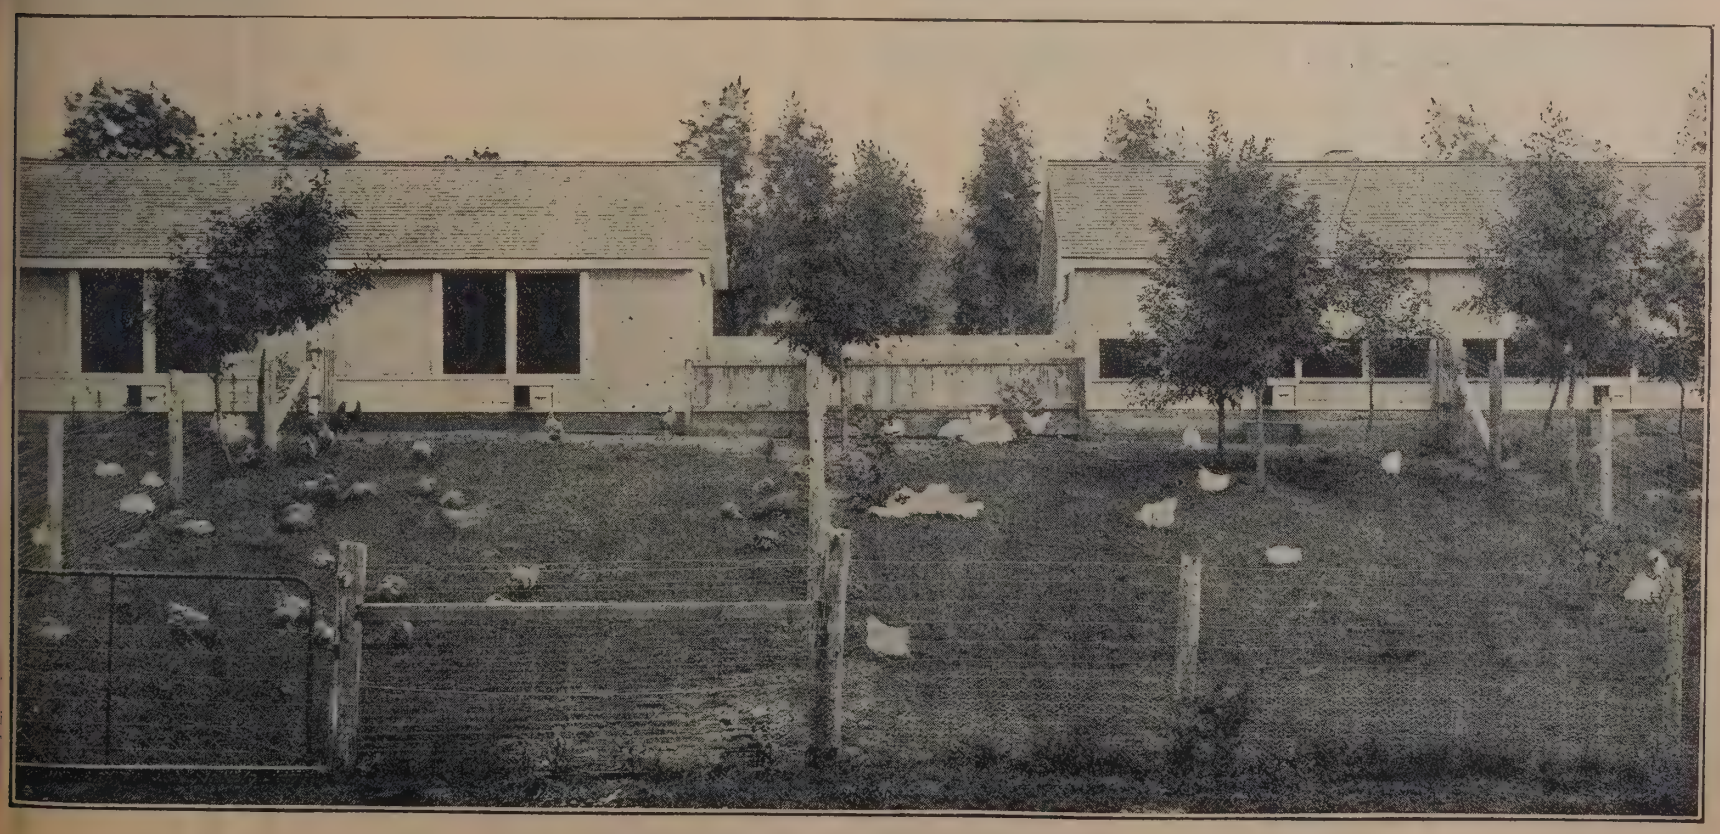
Building Details

The location of the poultry house is best on well drained soil so dampness will not enter the pens through the floor. Natural protection in the way of trees is helpful as a windbreak. The house should face the south, that is, the side with the cotton and glass should have a southern exposure. In making the foundation it is not necessary to dig ditches. The floor and foundation are made together of concrete. A good plan is to have a layer of five or six inches of small stones. On these stones the first layer of concrete may be filled. The first layer of concrete may be made of coarse gravel and cement in the proportion of ten to one. The finishing coat should be made of sand and cement to make a smooth surface. Bolts should be embedded in the concrete at the outer edges to fasten the sills.

For sills, two by four or two by six pieces may be used. Two by four pieces are used for studding and are spaced at 24-inch centers. Tarred or other building paper is put on under the siding. Paper is also used for the inner wall before putting on the shiplap lining. By boarding the outside and inside of the studding a four-inch dead air space is left. If it is desired to construct a house that will have better insulation, this can be accomplished by filling the dead air space with straw or planer shavings. Inside partitions are made of studding and wire netting to within thirty inches of the floor, the remainder of one-inch boards. Rafters of two by four material are used. The sheathing is of one-inch material, on top of which may be used ready roofing or tarred paper and shingles.

The Straw Loft

Two by four material is used for joists and on the under side of these the boards are nailed for the ceiling. Boards one by three inches spaced three inches apart on the ceiling allow free circulation of air from the pens to the straw loft. The space between the ceiling and roof is filled with straw. In each gable a door should be made at least thirty inches square. It is a good plan to have the gable doors slide vertically and hung from the peak by a rope or sash cord. In this way the doors can be opened sufficiently to allow outside air to pass through the straw and keep it dry. In extreme weather or when a direct wind is blowing, the doors may be partially or altogether closed.



The front or south wall of the house is made up of one-third cotton, one-third glass, and one-third wood. The arrangement of cotton and glass is shown in the illustration. The house at the right in the larger illustration has the glass and cotton arranged in continuous rows, while in the other the panels of cotton and glass are alternated. The arrangement of cotton and glass in continuous rows has advantages over the other system. The windows are placed about eighteen inches from the floor and are fitted so they can be removed during the summer. The cotton panels are hinged at the top so they can be opened during the summer and during mild weather in winter. Poultry netting of one-inch mesh is used over the windows and cotton panels to keep sparrows and other small birds out.

One door is made in each end of the house. For convenience and economy of space the doors are best made near the wall with the cotton and glass. One large window is used in each end of the house. They are made adjoining the door in each end.

Equipping the Poultry House

The equipment recommended for this type of house includes a dry mash

(Continued on page 577)

THE MANITOBA STRAW-LOFT POULTRY HOUSE

This picture shows two "Farmer's Poultry Houses" that have been used at the Experimental Farm, Brandon, Manitoba, for several years and with splendid results. Many houses of this type are now in use throughout the province. Note the different arrangement of cotton and glass in the two houses. The continuous rows of cotton and glass, as shown at the right, have advantages over the other arrangement.

HOUSING THE HOG

A DISCUSSION of the subject "Housing the Hog" involves not only hog houses but also a system of management. Twenty or thirty years ago the central community hog house was the "jack of all trades," meaning that it served every need of the swine herd every month in the year. During the past decade or so changes have come rapidly in methods of feeding hogs and in methods of preventing parasites and certain diseases. Because of this, one cannot think of hog houses without giving thought also to the way they are to serve the best interests of the herd. Let us discuss types of houses first and then give thought to housing.

There are two well defined classes of hog houses, each class comprising a number of types differing in design and construction but all for the same main purpose. The central or permanently located house represents one class and the colony or movable house the other.

The essential features to be considered in any hog house are warmth, dryness, abundance of direct sunlight, ventilation, sanitation, convenience, serviceability, durability, reasonably low first cost, and minimum cost of maintenance. It is not easy to get all of these in the same house.

The most common mistakes made in building hog houses are incorrect placing of windows to get direct sunshine at the right place at the right time, improper construction of floors, inadequate ventilation, unnecessary high cost for the service rendered, and lack of ease in carrying out sanitary measures necessary for the control of parasites and diseases.

Community Hog Houses

The three types of permanently located community houses in common use are the shed-roof type, the half-monitor type, and the gable roof house built with the long axis north and south, having the windows in the roof. Of these, the half-monitor house predominates. Each type may be built with slight variations.

The shed-roof type is, perhaps, an evolution of the early shed made of poles and covered with straw or swale hay. It is simple in design, built facing the south and has only one row of pens, without alley for convenience. Windows and doors are placed in the south wall to admit sunshine and make possible the attention of the caretaker as well as providing entrance and exit for the hogs. In severe weather this type of house is cold; beating rains or snow from the south may easily get inside; it is hard to control ventilation; if well built of modern lasting material the cost per pen is higher than in the half-monitor or the sunlit houses. For the farmer who produces no more than 6 or 7 litters a year, who is willing to sacrifice convenience and the discomfort of doing much of the necessary work outside, it serves the purpose fairly well.

The half-monitor house as compared with the shed-roof type represents a desire for more convenience, for an escape from stormy weather, and perhaps is partly evolved out of the ease with which shed-roof types of houses could be converted to houses of double capacity without doubling the cost.

The cross section of a correctly proportioned half-monitor house is illustrated in Figure 1. The floor plan of the same house is shown in Figure 2. The same type of house may be built with a 4-foot alleyway instead of a driveway 8 feet wide. The pens are the same size, 6x8 feet in each plan. The principal objections to this style of house are that a large amount of space is enclosed for no other purpose than to admit sunlight to the back row of pens, the north part of the south row of pens never receives sunshine, and the house does not lend itself to perfect ventilation. For convenience in taking care of the hogs it is ideal. The most serious and most common mistake found in houses of this type is the incorrect placing of windows.

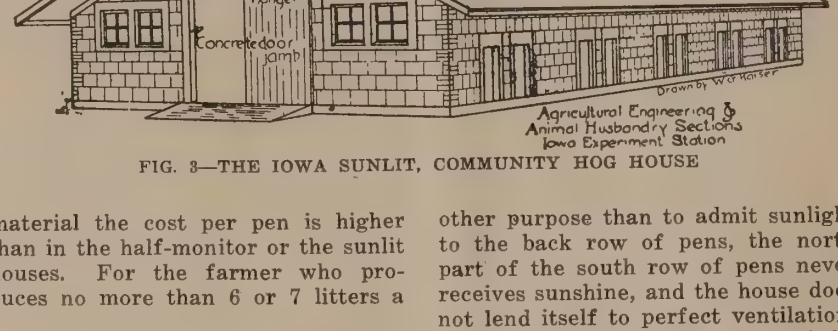


FIG. 3—THE IOWA SUNLIT, COMMUNITY HOG HOUSE

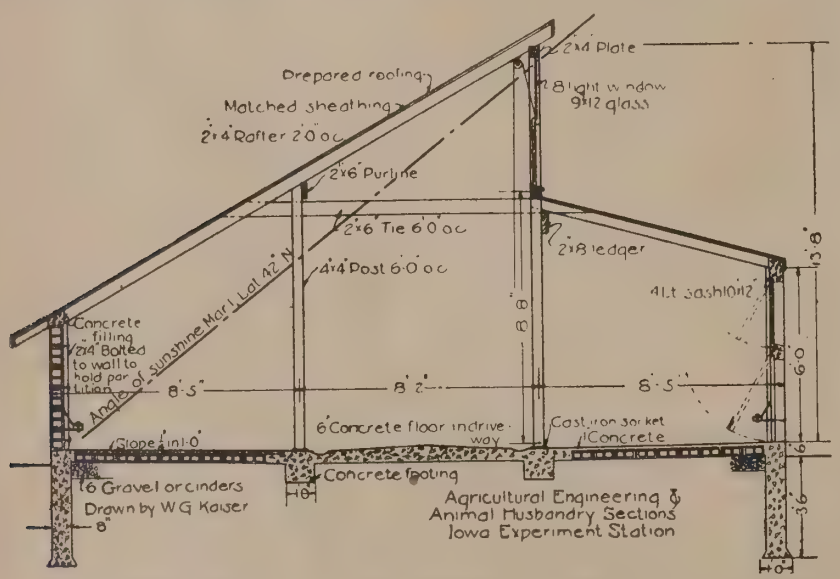

FIG. 1—CROSS SECTION OF THE HALF-MONITOR, COMMUNITY HOG HOUSE

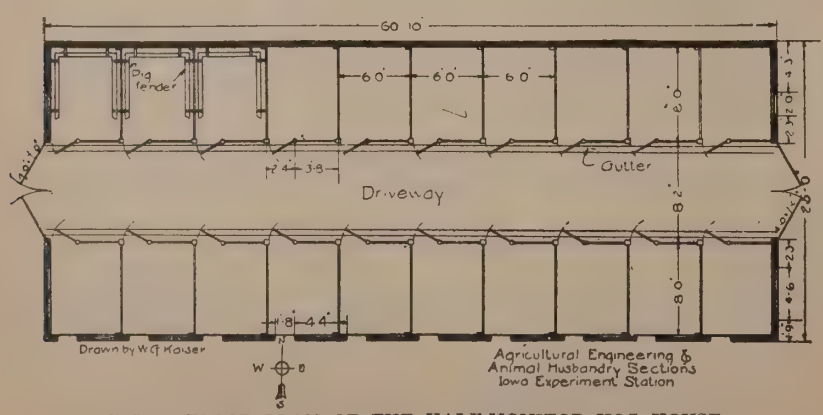

FIG. 2—FLOOR PLAN OF THE HALF-MONITOR HOG HOUSE AS SHOWN IN FIGURE 1

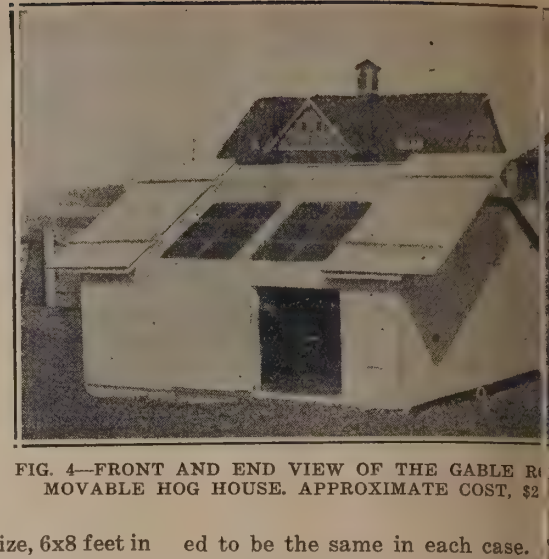

FIG. 4—FRONT AND END VIEW OF THE GABLE R MOVABLE HOG HOUSE. APPROXIMATE COST, $2

The Sunlit House

The third type of community house to find a place on many farms, particularly the larger farms where a good many hogs are produced, is the "Iowa Sunlit" house, built north and south with windows in the roof. This house is illustrated in Figure 3. The floor plan is similar to the half-monitor plan where the driveway is 8 feet wide. An advantage of this house over any other type is that the entire floor space is reached with direct sunshine. The walls are lower than in the half-monitor house. In comparing the costs of materials for a house of this type with one of the same dimensions of the half-monitor type, a 20 pen house in each case, the Iowa Station finds the latter type costs about 12 to 14 per cent less. The labor of construction is estimated to be the same in each case. "Iowa Sunlit" house presents a pleasing appearance. It must built north and south without o in sun obstructions on either si

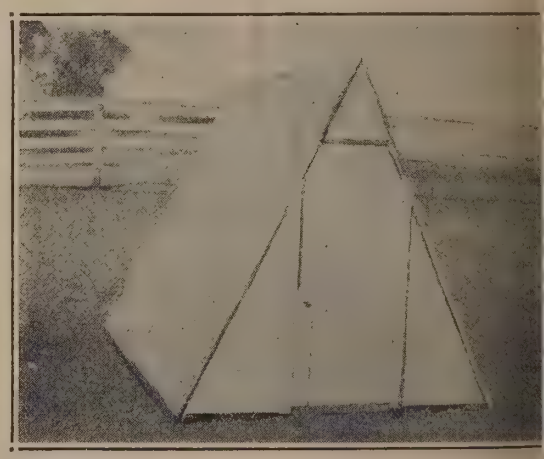

FIG. 5—FRONT AND SIDE VIEW OF THE "A" MOVA HOG HOUSE. APPROXIMATE COST, $18.

Movable Hog Houses

One of the best texts on mov hog houses is to be found in Bul 152 of the Iowa Experiment Sta In it 6 types of colony houses a lustrated, described, bill of mat given, and estimates of the co each given.

Two of these types are illust and named. Their comparative mated costs are likewise given i legend beneath the illustrations. tailed information on each type be found in the bulletin above tioned.

Housing Management

Housing the hog involves than class or type of hog house. remember visiting a farm in Ce Iowa some eleven years ago on w the owner had built a modern munity house of permanent con and clay block construction. house was ideal in its service pregnant sows and later their until the pigs were old enough t let outside. When this time the pigs scampered out on the seen contagion accumulated in yards over a period of nearly years of hog raising. It proved

HOT WATER AND STEAM FOR THE DAIRY

C. A. HUTTON, TENNESSEE

N farms where dairy cows are kept, an abundant supply of hot water is one of the greatest nveniences and an absolute necessi- or properly washing the dairy e ils. They cannot be properly ased unless the water is hot,— iz ing" hot, not lukewarm. Where lya very few cows are kept the wa- r is often heated on the kitchen o, but this method is not very sat- fs ory, as the amount of water a d is apt to be very small and it rt usually very hot by the time it c ried to the dairy house.

Te hot water heating outfit, de- gn d by the writer and shown in e ccompanying illustration, is an e: ensive and very efficient system lating water. It also furnishes a ffient amount of steam for ster- zig the cans, pails, etc. A small nt of coal or wood will heat a r l of water to the scalding point . few minutes. The same outfit a also be used for heating water r he farm laundry, bath, etc., in dion to furnishing t water and steam r he dairy.

A the water in the tr jacket or pipe il surrounding the e ot is heated it t natically moves w rd into the barrel d cold water from e ottom of the bar- ows into the jack- coil through the w pipe line. In this y all the water in e arrel is soon heat- . The barrel should s curely anchored to e wall and floor of e nilk house to pre- n the connections i; shaken loose by e movement of the n caused by the nt boiling of the tr.

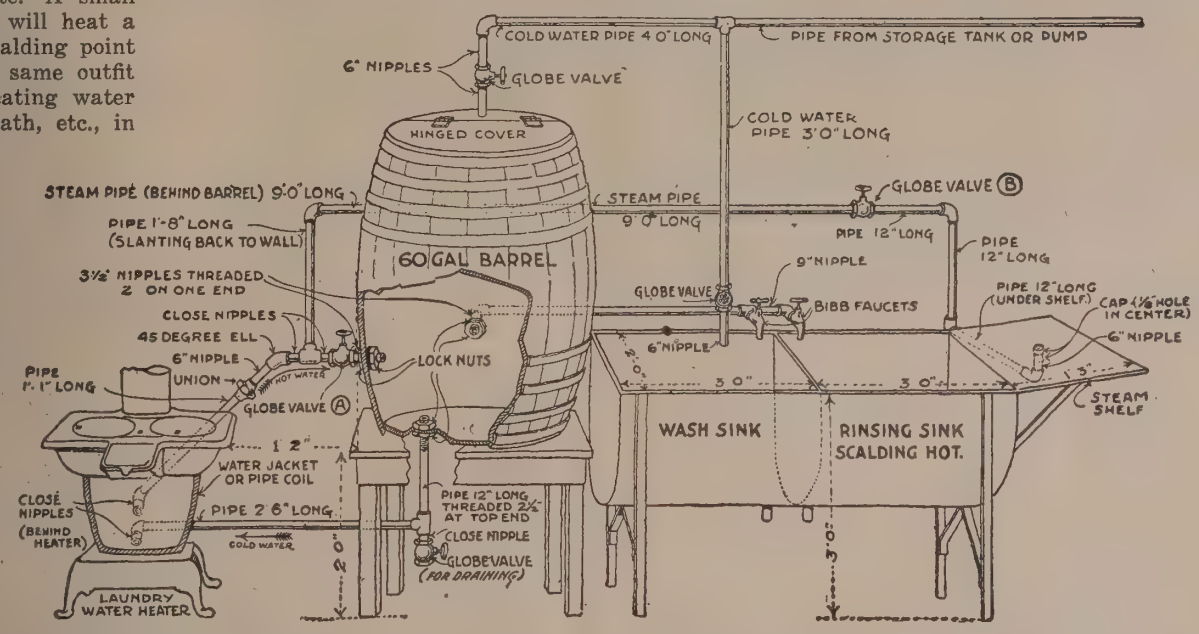
tng Up the Outfit

I setting up the t. begin at the back of the heater. Put on the connections on both the top and the bottom pipe lines until the barrel is reached. Bore three 1-inch holes in the barrel at the proper places and complete the connections to the barrel with lock nuts and washers. Then complete the hot water and steam lines to the wash sinks and steam shelf.

You Can Also Have Steam

Steam for properly sterilizing the utensils is of great assistance in properly cleaning them. The outfit shown will furnish plenty of steam in addition to hot water. When the water in the barrel has begun to boil and the operator is ready to begin washing the utensils, the globe valve A, on the hot water discharge line, is closed. This stops the upward movement of water from the heater to the barrel and the water in the jacket or coil is quickly converted into steam. The utensils are first rinsed out with cold or lukewarm water, then washed in the wash sink, laid over in the rinsing sink filled with scalding hot water, and then inverted over the steam jet for a few minutes. They are then pushed over onto the sunning rack to dry where they may remain until used again.

While steam is being generated, hot water flows into the jacket or coil from the barrel through the lower pipe, and steam will continue to flow through the steam jet as long as valve A is closed and valve B is open. When both valve A and valve B are closed the steam backs up through the lower pipe line and bubbles up through the lower pipe line and bubbles up through the water in the open barrel, making the outfit absolutely safe so long as an open barrel is used. Valve A should be kept open except when steam is wanted, because the water in the barrel will heat faster if it is open than if it is closed.



The steam pipe behind the barrel must be higher than the level of the water in the barrel to prevent the water from flowing through it before it is converted into steam.

When Barrel Tank is Not Used

To secure steam where the outfit is connected with a pressure water system or an air tight hot water tank, it is necessary to place a valve on the cold water pipe entering the tank so that the flow of water into the tank can be stopped while generating steam. If this is not done the pressure from the storage tank will force water through the steam line before it is converted into steam. Also place a pop-off valve or an air cock on top of the tank to relieve any excess pressure caused by not using the steam as fast as it is generated. When through steaming, the valve on the cold water pipe entering the tank and valve A should be opened and the water allowed to circulate freely, the same as when heating the water.

If only hot water is wanted the steam pipe and valve A may be omitted and the heater

(Continued on page 580)

AN INEXPENSIVE OUTFIT FOR HEATING WATER AND SUPPLYING STEAM FOR STERILIZING MILK UTENSILS

The following pipe and fittings are required to set up the outfit as shown, not including the cold water line from the storage tank or pump to the barrel and wash sink; 5 close nipples; 2 three-and-one-half-inch nipples, threaded 2 inches on one end, ordinary threads on the other end; 2 six-inch nipples; 1 nine-inch nipple; 8 ells; 1 forty-five degree ell; 3 tees; 1 union; 3 globe valves; 6 lock nuts; 6 washers with 1⅛-inch hole; 2 bibb faucets; 1 cap with ⅛-inch hole in center; 3 pieces pipe 1 foot long; 1 piece pipe 1 foot long, threaded 2½ inches on one end, ordinary threads on the other end; 1 piece pipe, 1 foot, 1 inch long; 1 piece pipe 1 foot, 8 inches long; 1 piece pipe 2 feet, 6 inches long; 1 piece pipe 4 feet long (hot water pipe from barrel to faucet); 1 piece pipe 9 feet long; sufficient pipe and fittings for the cold water line from storage tank or pump. All pipe and fittings ¾-inch galvanized. Many water heaters have one-inch holes for the pipe connections. In such cases two ¾x1-inch reducers should be included in the list of fittings. Due to an error in lettering the drawing the length of the wash sink and the rinsing sink is shown as 30 inches. Each should be 3 ft. long. The outfit will be more permanent if a metal gasoline barrel is used instead of the wood barrel. If an airtight barrel or tank is used with the steaming arrangement, either a pop-off valve or an air cock should be installed on the top as mentioned in the article. The outfit can be set up complete as shown, not including the wash sink, for $25.00 to $30.00.

DAIRY FARM CORN CRIB AND GRANARY

LTHOUGH dairying may be the main source of income from a farm it is well to keep in mind the farm is very much like a ifacturing plant. The buildings as the factory in which the raw rials are turned into a finished product. The shelter for the raw materials should prove a good investment and in order to do this they must last a number of years.

A building that will economically shelter the corn and grain for feed and seed on the dairy farm is shown in Fig. 3. In some cases it will be necessary to increase the length in order to secure sufficient capacity. The size should be determined by the rule that a bushel of ear corn occupies 2½ cubic feet and a bushel of grain occupies 1¼ cubic feet. The weight per cubic foot of grains is as follows: Barley, 39 lbs.; corn and cob, 25 lbs.; corn shelled, 25 lbs.; flax, 45 lbs.; oats, 26 lbs.; rye, 45 lbs.; wheat, 48 lbs. The work room is usually filled at threshing time as it is not used as a

The SIGNAL of THE SILO

The sea boasts prim light-houses, perched along the stormy shore,
To guide th' wind-tossed sailor; when his own eyes see no more;
Whilst we--we of the inland, have our Silos standin' guard
Through snow and rain and winter, with its fists a-beating hard.
And, somehow, we compare 'em, in a tidy sort of way,
With them as stand out yonder, where th' ocean roars, today.
Th' treasure-trove of cattle that are hungry with the morn
A storm-bound Silo, standin' in a restless sea o' corn

And whether made of cement, or stave, or iron, or tile,
Or woods of all creation, from up Maine ways to th' Nile,
Or whether concrete fellers get th' local upper-hand,
God bless 'em--they're ALL Silos, for th' better of th' land
A munch of tasty silage, makes th' Dairy records grow;
Who gives a hang for feed-bills and a winter full of snow
Th' herd is plump as butter...and if folks have cause to thank
It's because each farmer's Silo is a sort o' Savings Bank!

—W. L. LARNED

ALTHOUGH silo propaganda has been continued for a half century and although the merits of silage as a feed for dairy cows have been fully demonstrated for these many years, yet there are many farmers who at the present time are soliloquizing as to whether to build or not to build a silo *this* year. All the force of argument would seem to indicate favorable action, yet amidst it all there is confusion as to whether it will really prove profitable, and more confusion as to the particular type of silo.

But you ask, "Will it pay?" It is generally recognized and accepted that silage is a good feed for dairy cattle. It is palatable and succulent; it has an excellent effect on the digestive tract; and it supplements legume hay in such a manner as to make it an ideal basal ration and one with which almost any combination of available grain feeds may be used. But, will it pay? Does its cost overbalance its benefits?

There is much that can be said on this subject, but probably the best ar-

"If dairy cows were less practical and not so deeply engrossed in their daily business of milk, they would, long ago, have set apart a special day of thanksgiving in honor of the introduction of the silo."—Roy Harris.

gument is that practically every successful and prosperous dairyman has one or more silos. There were over a half million silos that proved their worth this winter in reducing feed bills and increasing milk yields. Figures of profit could be quoted but, after all, the general adoption of the silo by the best farmers is most convincing proof that it is a profitable investment.

The Kind of Material to Use

Having decided that we shall erect a silo, the next question is the kind of material to use. The writer could state his own personal preferences, but he finds that the man next to him has other preferences. Both realize that with silos, as with machinery, only general principles may be laid down. If the manufacturer has followed these, then the decision is up to the farmer. In the building of a silo there is a choice of materials, different methods of erection, various types of doors, different forms of roofs, etc. However, there are certain fundamentals that should be considered.

1. Walls air- and water-tight. The side walls of the well constructed silo are air- and water-tight. If air can get into the silage, it will cause the silage to continue to ferment, and molds will grow, thus spoiling the silage around the outside of the silo. The water in silage helps to pack the silage, displacing and forcing out the air. If this moisture is then allowed to seep out through walls or around doors, air will find its way in, resulting in spoiled silage.

2. Walls smooth, strong, and plumb. The inside of the silo walls must be smooth and plumb. Rough or irregular places on the walls prevent the silage from settling evenly and often cause air pockets to form. Unless the walls are plumb, the silage will settle away from them and allow air to find its way down between the walls and the silage. The silo wall must be strong to withstand the bursting pressure of the silage which increases with the depth of the silo.

3. Cylindrical shape. The principal cause of the excessive amount of spoilage in the early day silos was due to the shape of the silos. Many of the early silos were rectangular or hexagonal. It was exceedingly difficult to pack these silos so that the silage would not spoil. King of the Wisconsin Station suggested the use of the cylindrical silo which overcame this difficulty and greatly aided the adoption of the silo.

Size of the Silo

The successful use of silage is dependent to a considerable degree upon the size of the silo being suited to the size of the herd. If the diameter of the silo is too great, the silage will not be fed off rapidly enough to keep it from spoiling, and a slightly spoiled silage may be fed during part of the year.

The diameter of the silo is determined by the amount of silage needed per day, and the season of the year when the silage will be fed. It is necessary to remove at least two inches of silage daily in the summer, while one inch will be sufficient during the late fall and winter.

Table I—Rate of Feeding From Silos of Different Diameters

Diameter	*Approximate minimum lbs. to be fed daily Summer	Winter	†Number of mature cattle to keep silage from spoiling in summer when fed at daily rate of 40 lbs.	30 lbs.	20 lbs.	15 lbs.
10	526	263	13	17	26	35
11	634	317	16	21	32	42
12	756	378	19	25	37	50
13	884	442	22	29	44	59
14	1030	515	25	34	51	69
15	1178	589	29	39	59	79
16	1340	670	33	44	67	89
17	1520	760	38	50	75	101
18	1690	845	42	56	84	112

*This is one inch in winter and two inches in summer, which is the least amount it is practicable to feed off and avoid spoilage.

†If silo is for winter feeding, it will require only half as many cows to keep the silage from spoiling.

The height of the silo depends upon the number of animals to be fed and the length of the feeding period. In winter silage is usually fed at the rate of 3 pounds for each 100 pounds live weight of cattle or 30 pounds daily for a 1000-pound cow. The following table illustrates the application of Table I to herds of various sizes and is suggestive in determining the size of silo to build:

Table II—Feed for a 200-day Winter Period With Cows Fed 30 to 35 Lbs. Daily

†No. of mature cattle	Silage needed	Size of silo to build Diameter	Height*
	Tons	Feet	Feet
10	34	10	28
12	41	10	32
15	50	12	29
20	68	12	36
25	84	14	34
30	102	14	39
35	118	14	44
40	136	16	39
45	157	16	44
50	170	16	48

*These heights allow for five feet for settling of the silage; that is, 23 feet of silage in a silo 10'x28' would provide approximately 34 tons of silage.

†In summer double this number will ordinarily be required to feed down the silage fast enough to keep it from spoiling.

A high silo gives greater compression, which means that the air is more thoroughly pressed out with resulting better quality of silage. It also means the storage of more silage in a given space. The height should be from two and one-half to three times the diameter for best results, and it is well to set the minimum at 28 ft. to 30 ft.

Investigate the silo and one finds it well nigh indispensable to make milk economically. Act on this knowledge and larger success will follow. Returns come to him who does.

Silage is more compact in the bottom of the silo than in top, and the weight per cubic foot increases with the depth. In a silo containing 30 feet of silage the weight per cubic foot will vary from about 32 pounds a the top to 43 pounds at the bottom, the average approximating 40 po For the convenience of those des more complete information than en in the accompanying tables have prepared a silage meas

Eight tons of corn silage can be stored in the same space required by one ton of hay. Therefore same space stores three times much digestible nutrients in form of corn silage as in the f of alfalfa hay.

chart giving the capacities of of varying diameter and heigh also for contents when a portion has been fed out. This will be se Hoard's Dairyman upon recei five cents to cover cost of mailin

Summer Silage

Feeding silage during the su months is one of the best metho preventing the abnormal decli the yield of milk. It is usua cheaper feed than soiling crops has been found to be equal in fe value. A silo of small diameter be used so at least two inches lage will be fed daily. A diamet 10 or 12 feet is the usual size.

Types of Silos

There are many types of silos one of which will be satisfacto they meet the requirements have already been discussed. more common kinds of silos i the solid concrete wall, concrete concrete block, vitrified tile, w stave, wooden hoop, brick, stone sheet steel. Pit silos are com used in the semi-arid regions. mation can be secured from the

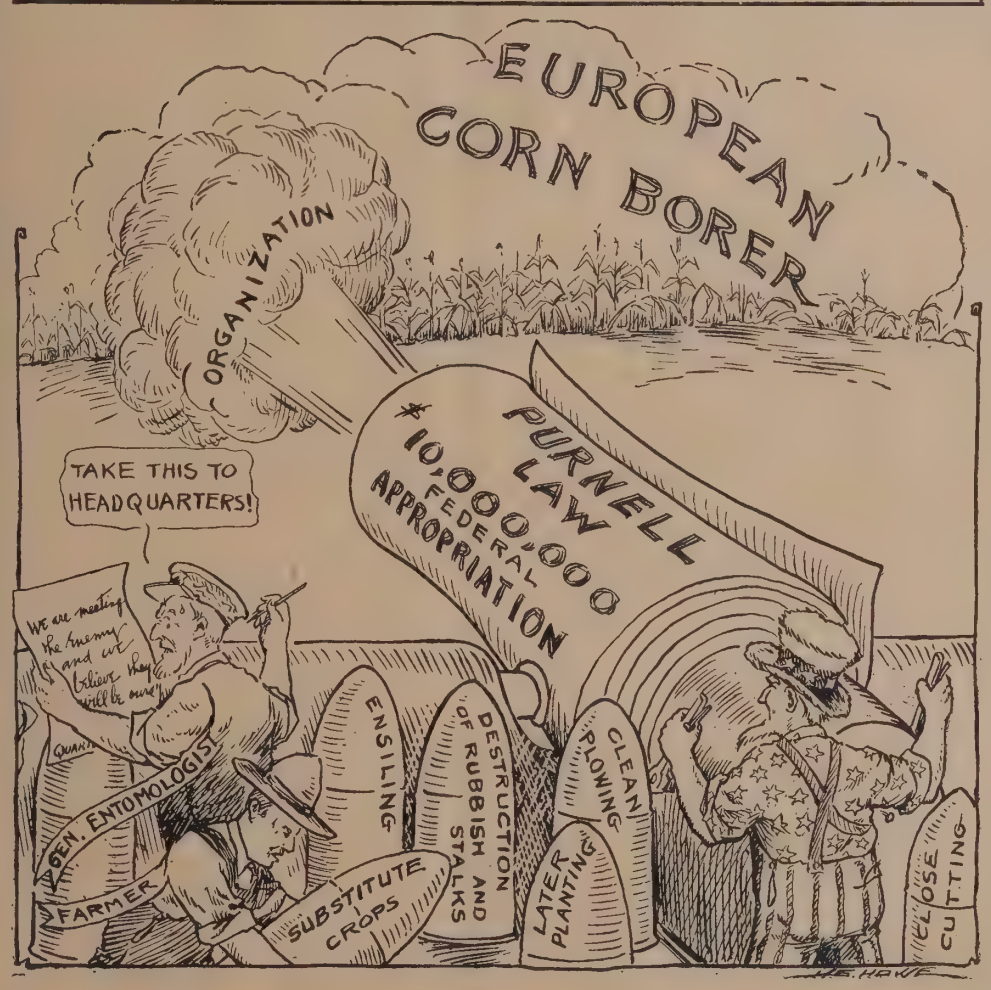
ELECTRICITY IN THE FARMER'S FAMILY

E. A. MARTINI, ILLINOIS

HE discriminating farmer's wife has learned to distinguish between modern improvements na are worth while and those that re not. Of all the improvements na bring comfort, convenience, and ati action to a farm home, elec- icy stands at the head of the list.

I has been said that electricity, tr duced into the households of the at n, has eliminated as much as 50 er ent of routine household drudg- ry The burden of the housewife as been lifted to such a degree na she is able, without neglect- g er domestic duties, to carry n er social and club activities. Mo over, beside speeding up er work and enabling her to ni it so much sooner than er ofore, the actual work is on in a far more satisfactory wa and under more attractive ur undings than before this ro erful force was at her beck nd call.



E ctricity can supply currents or ll the labor-saving devices uc as the electric sewing ma- hi , bread toaster, electric or vacuum cleaner, mangle, ra ng machine, and for pump- g ater. A first-class washing ma ine will save hours of time s ll as eliminate much strenu- us work each week. A small mot using no more current na an average sized bulb will ee the machine operating, hi the housewife goes about er ther work.

A electric flatiron on the cool, ac porch will do away with mu of the drudgery and most f e discomfort of ironing in ot weather. A small electric an will make ironing and other ro less disagreeable in hot we er. As for a hen house le ically lighted, the chickens re heated out of several hours ep and made to work over- m

E ctricity does not steal the xy n from the air, causing ill ea n. It will make home life n e farm so much more at- ac ve that farm ties will not b oken, nor boys and girls driven t city, as has happened in count- ss stances before the days of elec- ici . Farm work will seem so uc pleasanter that the problem of no ge of farm help and reduced ar production will be solved.

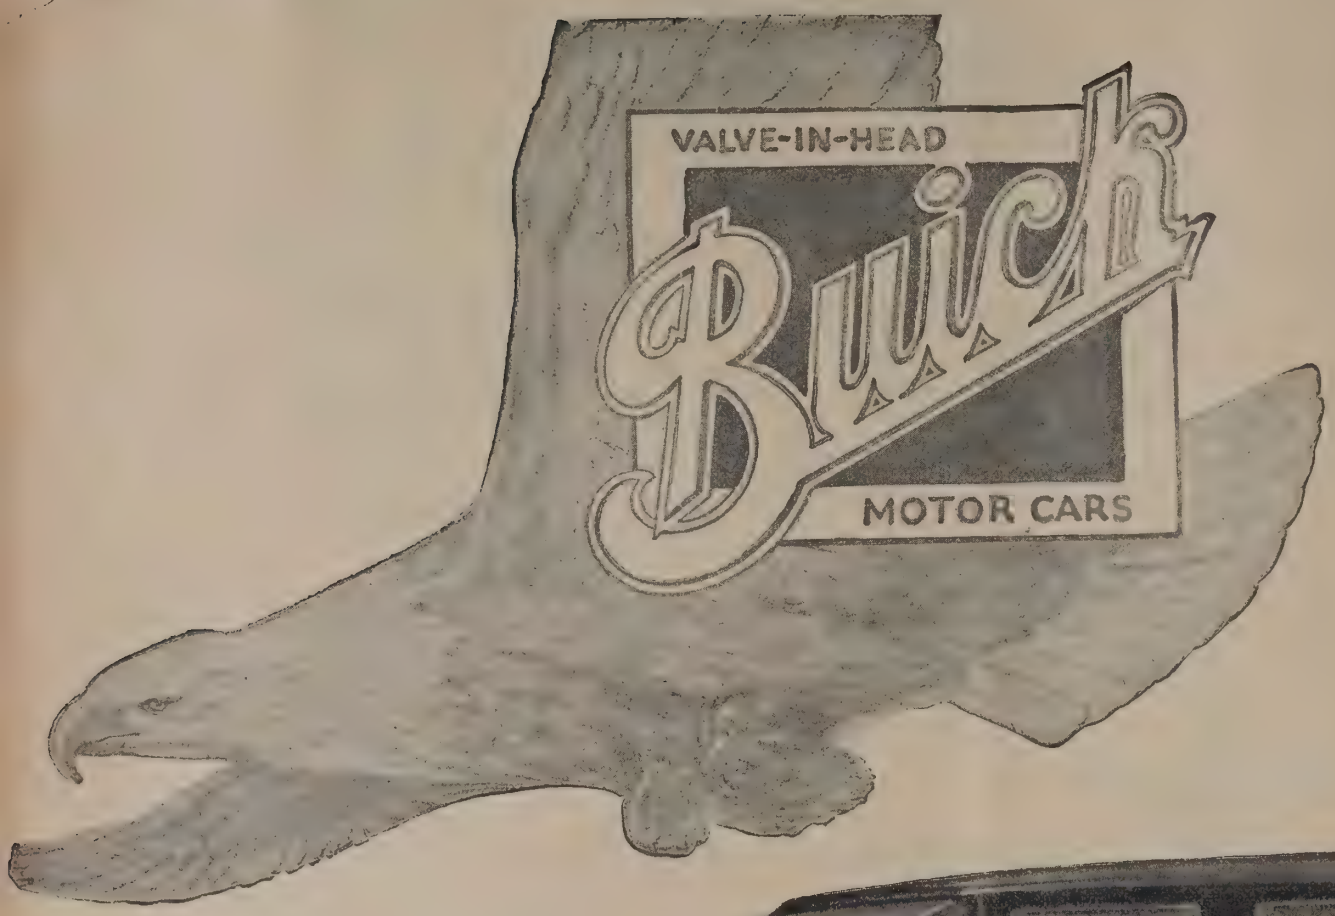
F electricity is now doing on the ar what it has done to simplify the sk f the home, not only as far as he usewife is concerned, but also t actual agricultural activities. he lectric light and power compan- s roughout the country, whose er ries include rural communi- es, ave been extending their net- or of wires in all directions into he rming and ranching communi- es nd are supplying the farmers nd anchers with currents.

WAR HAS BEEN DECLARED

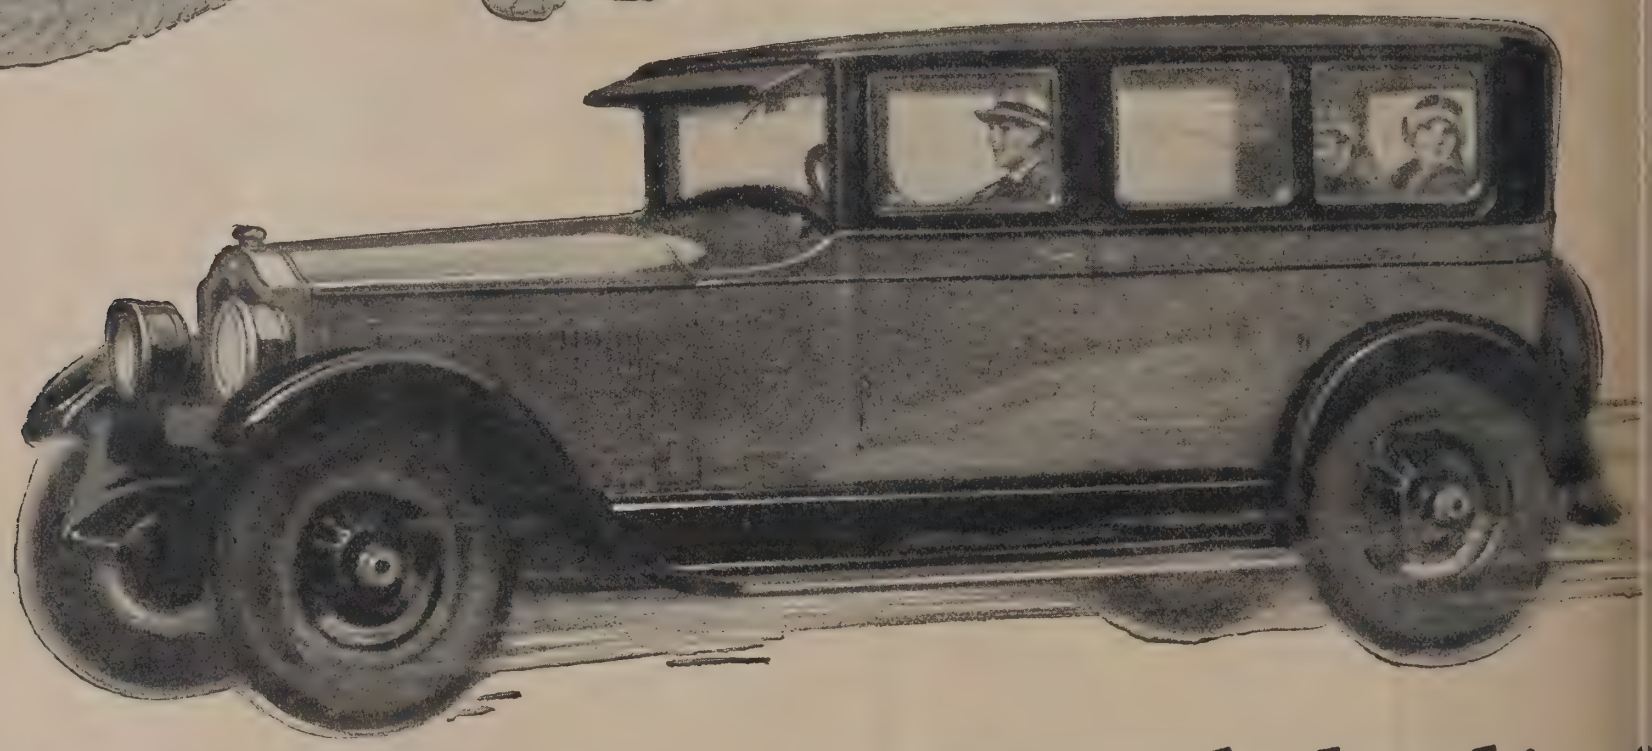
very cold if the season was winter, and this gave him a poor foundation for the day's tasks.

But with the installation of electricity in the farm houses, all this is different. True, the farmer has to rise more or less early in the morning, but this may be because he has to ship his milk in time to make a train. However, in rising he can do this in a lighted room simply by turning a switch and is no longer obliged to grope for a match to light the oil lamp. He even lights his way downstairs and instead of carrying in a load of wood for the breakfast fire, he turns a switch and immediately the heating element of his electric range starts to glow. If he wants a cup of coffee before beginning his daily tasks, the percolator is ready. All this sounds like a fairy tale, but it is all too true. Is it any wonder that today the farmer and his family get more joy out of life and have more time for self-culture and interest in public affairs?

There are a few items to be kept in mind when considering the purchase of an electric plant. The great distances so many farms are removed from town generally prohibit electricity from being transmitted to them from city plants. For this reason it is usually necessary to supply currents through private plants and it is a serious mistake to attempt this without employing an expert for the installation. It is also false economy not to buy good equipment. Poor wiring and improper connections can often do great harm. A short circuit may easily ignite the slightest inflammable object—a cobweb, dust, a straw, etc., and a fire is caused. If all work is done in strict accordance with the National Electrical Code, the danger of fire is practically eliminated.



Most private plants are either 110 volts battery or non-battery, or 32 volt battery plants, the latter being more frequently used. All the attachments such as wires, motors, bulbs, batteries, etc., for a 32 volt current are slightly more expensive and the current cannot be economically conducted for a distance of more than 500 feet, nor is it advisable to use a larger motor than ¼ horse power. Moreover, it is impossible to heat the house and difficult to use an ice machine with a 32 volt battery plant. But the cost of such a plant is the lowest except, perhaps, that of a 110 volt non-battery plant and the danger of shocks is greatly reduced on account of the low voltage. The storage battery gives power as soon as the switch is closed and also insures a few days' reserve, all this not being the case with most other plants. The 110 volt non-battery plant costs about the same as the 32 volt battery and the attachments cost less, as standard equipment can be used with 110 volt, but, as the plant is automatic and consequently complicated, it occasionally gets out of order and fails to start when current is needed. When buying or ordering any fixtures, motors, or other attachments, voltage and current must always be mentioned.



The future of our nation depends, in a far higher degree than is generally recognized, upon the farmer and his family. Anything which will in any way help these agricultural brothers indirectly helps our nation at large and should be most assiduously encouraged. That can surely be claimed for electricity.

Milk Powder in 1298

The following interesting translation from Marco Polo was recently received by Dr. Van Norman from his sister. It indicates that as early as 1298 A. D. the ancients had a pretty fair method of making powdered milk.

"When the service, that is the military service, is distant, they carry but little with them. They make a provision of milk thickened and dried to a state of paste, which is prepared in the following manner: They boil the milk and skimming off the rich or creamy part as it rises to the top, put into a separate vessel as butter for so long as that remains in, the milk will not become hard. The latter is then exposed to the sun until it dries. On going into the service, they carry with them about ten pounds for each man and of this, one-half pound is put every morning in a leathern bottle with as much water as is thought necessary. By their motion in riding, the contents are violently shaken and a thin porridge is produced, on which they make their dinner."

Vibrationless beyond belief

The Supreme Triumph of American Engineering

LUXURY AND COMFORT beyond comparison are now added to Buick performance by the latest achievement of Buick engineers—an engine *vibrationless beyond belief.*

At home and abroad, Buick has long been recognized as an outstandingly fine American motor car.

American boundaries never have confined Buick popularity. All over the world purchases prove that Buick is the car most people would like to own.

The world thinks well of Buick today because of Buick excellence already demonstrated, Buick value already familiar, and because of that rugged day-to-day dependability—always a characteristic of this famous motor car.

Now Buick has given the world new reason to pay its tribute to the genius of American engineering—an engine *vibrationless beyond belief*—without question the century's finest contribution to the pleasure of motoring.

WHEN BETTER AUTOMOBILES ARE BUILT, BUICK WILL BUILD THEM

Wooden Hoop Silos

HOARD'S DAIRYMAN:—Since the iscovery that Minnesota 13 corn will ature to produce good ensilage in e coast counties of Western Wash-gton, more and more dairymen in at section are building silos.

Will W. Henry, county agent in ing County, Washington, paved the

Twin wooden hoop silos on F. H. Thuy-er's farm of Washington that were erect-ed at a total cost of $220 each.

ay a few years ago for the erection f 25 such feed containers in his parish" when he demonstrated the se with which wooden hoop silos n be built and paid for. Henry ys that the entire cost of a 30- by 2-foot structure for lumber, hard-are, paint, and labor when labor is gured at $4 a day, need not amount more than $220.

The silo is a single wall of com-on flooring bound together every vo feet with hoops made out of four y 3-inch batting ⅜ of an inch ick. The hoops are made by bend-g the bats around a temporary or rmanent form and nailing them to-ther. The doors are continuous d made out of 1¼ inch flooring 2 foot sections. Henry says the ly necessary scaffolding are 16 eces of common 1 by 6 fence ards 18 feet long to hold the hoops place until the flooring can be iled on, and four 2x10 or 2x12 anks for the men to stand on.

Wisconsin. GUY A. PETERSON.

Try Optimism

HOARD'S DAIRYMAN:—If a pho-grapher wanted to make a picture at would give the clearest idea of e appearance of an elephant, he uld not locate his camera within o or three feet of the animal's le. In case he did, the picture uld be more like a wall, or if a fly ppened to sit unnoticed in front of e lens, the representation of the phant would be misrepresented.

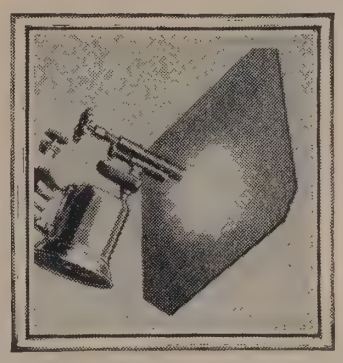
The agricultural situation is re-ving about this kind of considera-n at present. It has been riding the band-wagon of publicity for a g time, and there still seems to no shortage of wind to blow the rn of distress. Agriculture is tak-g its turn as a topic of public in-est. It gets more front-page space n a dozen prize fighters, or the mpion coffee drinker, or a three-ged chicken; it gets more edi-ial comment than short skirts. hen a subject is at this stage we e at too close range to see it most arly. Let's look at it as we look things that are ten, or twenty, or ty years past.

In the past, someone will say, re has been nothing like it. There s not—exactly. Neither was the ather last year exactly like that of y other year, but the future can judged sufficiently to convince us that we are not likely to have January weather in July.

Changes in agricultural affairs have come as surely as the seasons, although not as often. There is no more reason to doubt that another change will come than that another season will come.

About 1890 there were a number of farm organizations formed for the purpose of better farm conditions. They tried the legislative way of making things right and there was some conspicuous legislation in places. Whether it helped or hindered is unknown, but the time came at the beginning of the next century when farmers again became optimistic.

However, a few years later the worry of "the high cost of living" came along and in trying to locate the cause of professional worriers nearly ran the poor "middle man" out of breath. Also about this time efforts were made to insure plentiful production of farm products. The cost of living was getting so high that surely there seemed to be no danger of a "surplus." There was alarm over abandoned farms and alarm lest some of the boys would leave the farm.



Then there was war time, when there was a "surplus" of money and credit, when farm land made good interest on a high valuation, when farmers bought freely. This also seemed it would go on indefinitely. Overdestruction of property was the big cause of high prices then.

Now we are told overproduction is the big cause of low prices. There is another cause, or it might be said that there are two causes and both of them are overproduction. The one is the overproduction of agricultural pessimism. "Surplus" has been stood up before the public so repeatedly that it has come to look like it would feed the world for a generation. Keeping this in mind discourages any tendency to hold products. The average exported surplus of corn is a smaller part of the whole crop than the reduction caused by an unproductive season. When optimism comes again the surplus will not be a problem.

Look at present prices as only another incident of farm life. If farmers in general will do this they will be well before the farm doctors can get to them.

Polarine Costs Little—

THE PERFECT MOTOR OIL

Saves Much!

There is sound sense in the old saying about an ounce of prevention. It holds true for tractors. Keeping your tractor perfectly lubricated with Polarine is an ounce of prevention that costs little—and saves much.

Polarine is an economical motor oil. The enormous demand for Polarine has necessitated production on a vast scale, making possible the low price of this premium product.

Polarine *prevents* the trouble that makes repairs necessary. This ounce of prevention costs a lot less than a pound of cure! Repairs are an expensive cure!

Polarine is the good old stand-by on the farm—always the same—always dependable—always economical. Polarine lubricates every surface of the engine with a film of oil that protects it from friction and makes it run smoothly. Polarine takes good care of the expensive engine in your tractor—keeps it in good health—running steadily, powerfully—at a minimum of cost.

Use Polarine regularly to lubricate your tractor and you'll lengthen the life of your expensive machine—save money by preventing the troubles that cause repair bills—and enjoy the satisfaction, besides, of seeing your work done ***when*** you want it done—*as* you want it done.

Polarine is one of the major products of the Standard Oil Company (Indiana), scientifically perfected after long years of work to meet *farm needs.* Different grades have been developed for different makes of tractors and the chart will tell you what grade your tractor requires.

To get Best Results—change your motor oil at frequent intervals.

For correct grade consult chart at Any Standard Oil Service Station.

Wonderful New Method

Milks Cows as No Other Machine Has Ever Milked Cows Before!

The great Surge Milker, with its wonderful NEW Surging—Tugging Action, has taken the whole country by storm. Farmers everywhere are fast replacing their old machines with this new wonder milker. Its marvelous NEW Surging—Tugging—Action gives the cow's teat the real TUG of the calf—and, like the calf, TUGS harder and harder as the cow milks out. Cows LIKE this new Surging—Tugging Action. They contentedly give down MORE milk. For example, J. M. Eiskin of Sedalia, Missouri, writes us: "Within a week after I had installed The Surge, my herd of 20 cows showed a daily increase in milk flow of 5 gallons."

Whether you have a milking machine or not you owe it to yourself to mail the coupon below right now and learn what the wonderful Surge Milker will do for YOU.

Surge Milker

For the first time in the history of machine milking The Surge gives you this wonderful NEW advantage: Easy, Instant, Adjustability to milk each and every cow differently—just as each one should be milked. As you go along the line, with The Surge—*and this holds true ONLY with The Surge Milker*—you quickly and instantly adjust it to give each cow just the Suck and Tug each one needs. Think what that means! This one feature, alone, has induced many critical pure bred breeders to replace their other machine with The Surge. Certified Farms endorse The Surge because it is the ONLY milker with No Long Tubes and No Claws—is EASIER to clean—and really does produce clean, low count, premium priced milk every day—EASILY.

Send the coupon below now for details of our amazing FREE Demonstration Offer that enables you to prove all this yourself before you obligate yourself in any way. We want you to see and know what The Surge will do for you—at our expense—and then we are perfectly willing to abide by YOUR decision. Farmers also find our EASY TERMS a great convenience. Mail the coupon and get all this good news now.

This Bull Will Give You High-Test Daughters

Here is a bull as gentle and easy to handle as could be found. He is six years old—a perfect breeder, and a bull of good individuality.

His dam produced 978 pounds of butter from 18,347 pounds of milk in a year; and 32.36 pounds of butter from 560 pounds of milk in 7 days.

His sire's dam produced 1389 pounds of butter from 30,230 pounds of milk in a year.

This bull was used on a small herd, and when we saw his calves we bought him and have used him on some of our heifers. We now have these heifers safe with calf to him and can offer him to any breeder who can use a good bull of this age with our fullest recommendation.

A SON OF

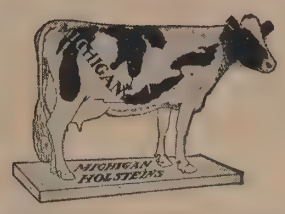
PRIDE OF SIR PIETS

FOR SALE

Born Jan. 12, 1927. A very typy calf, well marked and bred in the purple. If you will need a bull next winter buy this calf and save money.

His Sire:

PRIDE OF SIR PIETS, is a senior sire at Femco Farms. His dam is the highest record daughter of "37th" with 1327 pounds as a 3-year-old. His sire is a 42-lb. son of the famous sire, K. P. O. P. Eight 2-year-old daughters of Pride of Sir Piets have made from 20 to 33 lbs. His first 2-year-old to finish a year record made 908 lbs.



His Dam:

SOUTHSIDE CLARA ORMSBY, a splendid individual now making fine year record. Her sire is by a son of Pietertje Maid Ormsby and her dam is a 25-lb. 3-year-old daughter of a 31-lb. cow and a granddaughter of Oak De Kol Ollie Homestead, twice Grand Champion at the National Dairy Show.

SONS OF PABST PERSISTENCY

FROM PROFIT MAKING DAMS — FARMERS' PRICES

PABST PERSISTENCY is a son of King Segis Alcartra Prilly from a 30-lb. 2-year-old daughter of Creator. He is an excellent individual and every one of his 20 sons and daughters born to date are good ones. We offer bull calves 6 weeks to 6 months old by him, from good producing dams at prices which make them real bargains. Write us today.

RED ROSE FARMS DAIRY, F. B. Ainger, Jr., NORTHVILLE, MICHIGAN

A 30-Lb. Service Bull

Nicely marked, 80% white, and an excellent individual. He combines show-ring type with heavy production in a high degree. Born February 28, 1926.

His sire was a show bull, and a son of the famous 35-lb. show cow, "White Susie." She has a record of 1113 lbs. butter and 28,361 lbs. milk in 365 days at 11 years of age.

His dam is a 30-lb. cow with a 39-lb. sister and her dam made 862 lbs. butter in a year as a Sr. 2-year-old.

Production and quality are combined in this pedigree.

"GRAHAMHOLM" ONE OF AMERICA'S GREATEST HERDS

TO BE COMPLETELY DISPERSED AT AUCTION

The Grahamholm herd is the result of a quarter of a century of constructive breeding on the part of Dr. Christopher Graham, its owner. Besides having bred and developed numerous show ring winners and record-breaking producers, Dr. Graham has the distinction of being the only man to breed and develop three 30,000-lb. milk producers or to have had in service three sires that have each sired 30,000-lb cows. The herd is now at the very peak of its development and the sale offers an opportunity without parallel in breeding history.

SELLING!

GRAHAMHOLM COLANTHA SEGIS MAID
Butter 365 days 1316.58
Milk 33545.60
World's Champion 305-day producer for milk and butter over all ages and breeds. Two daughters and two full sisters selling.

8th NATIONAL Cooperative HOLSTEIN SALE

Springfield, Mass., June 2, 1927

Following the Annual Convention of the Holstein-Friesian Association of America

WISCONSIN BESS JOHANNA ORMSBY
A 1037-lb. three-year-old daughter of Sir P O M 37th, due in August by a son of a 30,000-lb. cow, sired by a son of the only 37,000-lb. cow. **Detroit Creamery Farms, Mt. Clemens, Mich.**

HIGHFIELD COLANTHA MOOIE 2d
A 25-lb. three-year-old daughter of the World's Champion in Class B.—Highfield Colantha Mooie. **John G. Ellis, Lee, Mass.**

Holstein breeders everywhere and all who are interested in the Black and White Cow, are cordially invited to come to Historic New England for the Annual Convention of the National Association and for the

8TH COOPERATIVE NATIONAL HOLSTEIN SALE

Like previous National Sales, this will be a sale of real seed stock, with offerings that appeal to the small breeder or the dairyman as well as to the breeder with a more highly developed herd.

We show here pictures of just a few representative offerings, to give you an idea of the calibre of the sale. These are females that will pay a big profit at the pale and at the same time will build your purebred herd better and better through their offspring.

Only a few bulls will be sold and these have been very carefully selected for type, records and blood lines. Every one is from a large record dam and by a nationally known sire, but the important qualification in the selection of these bulls has been TYPE.

All offerings, both male and female, have been personally selected by competent committees from the various states, mostly from accredited herds, and the leading breeders from all over the country stand back of their offerings.

For Illustrated Circular and Full Information

The Farm Home for Living

(Continued from page 494)

the development of a sturdy, self-reliant people. Such a people is sure to be, if properly educated, a strength to the nation in time of stress and well able to govern itself and help other nations not so strong.

As the farmer's work has much to do with nature and her laws, his home is usually one in which there is a sturdy loyalty to the home and to the family. The advantages of the farm home are so well recognized that many people whose work is in the large centers of population try to secure a home in the suburbs or rural section adjoining in order that some of the advantages of quiet and open space may be secured for the family.

The influence and training of the home life of young people persists through life and greatly influences their outlook and thoughts. It is therefore very important that a nation which is to maintain its enlightenment and honor must encourage the establishment and maintenance of homes that will help to develop habits of industry and thrift and will give the young people ideals of character and patriotism.

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. Let us advise you about your next sire.

MARSH FARM, WATERLOO, IOWA

BUY HOLLISTON SIRES

LANGWATER HOLLISTON, our famous senior herd sire, now has 23 A. R. daughters and 7 A. R. sons. His daughters are unusually persistent milkers and have what many call the foundation type and character. Langwater Holliston is out of a superior daughter of Imp. King of the May and he is sired by Jethro's May King of Linda Vista.

NOW OFFERING FOR SALE TWO YOUNG BULL CALVES that will be ready for service next winter. Dam of one now on test will make 600 lbs. fat. Dam of other made 583 lbs. fat in GG.

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

solve. Then swab each sore with a er cent solution of mercurochrome. that for two days and then apply ointment composed of one part of ture of iodine and two parts of eline as often as found necessary.

Sodium Fluoride for Lice—Bloating

used sodium fluoride, which was recomded to me by the county agent here, on cows this last winter and had very good lts. The dust from the powder did not afe me in the least, that I could see.

bought some alfalfa hay this last winter had been feeding it twice a day for t six weeks without any trouble. I fed thy once a day along with the alfalfa. night after feeding alfalfa hay, one of cows bloated so badly it was necessary e to tap her with a trocar. I fed a litlfalfa hay to her after that, to be sure it the alfalfa that made her bloat. Every I fed the alfalfa hay, she would start to a little, so I would take the rest of the away from her immediately.

w I make her eat timothy for a while, h is the only other hay I have at present, give her a little alfalfa. She does not in feeding in this way. What is a good to give a cow if she starts bloating ? Is soda in warm water any good? Do think this cow will get over this trouble, e can eat alfalfa again? I have had no le with any of the rest of the cows.

e place where I tapped the cow does not to be healing very well. Matter started n from it. What would you advise puton this sore? I washed the place well lysol in water after tapping and then n some carbolated vaseline.

lton, Minn. R. A. M.

hen a cow bloats, give her two es each of pure turpentine and natic spirits of ammonia in a t or more of milk. Then tie a d stick or piece of thick rope, bit- in the mouth. Tapping should one only when the cow is in imate danger of suffocation (asiation). Before tapping, clip the from a patch of skin high up in eft flank close to the last rib and under the transverse processes of spine and apply tincture of io- or a 5 per cent solution of coalisinfectant or carbolic acid. The r and canula should have been lized by boiling before use. When gas has escaped always replace trocar in the canula and with- it very slowly to prevent pull- up feed, etc., from the stomach causing infection and an abscess. fistulous sore now present will to be opened up, cleansed, and fected daily with a fresh 2 per solution of mercurochrome.

Mastitis

ve infective udder trouble or garget in rd of Holsteins. Is there any cure for ill calves, by nursing affected cows, have trouble when they freshen?

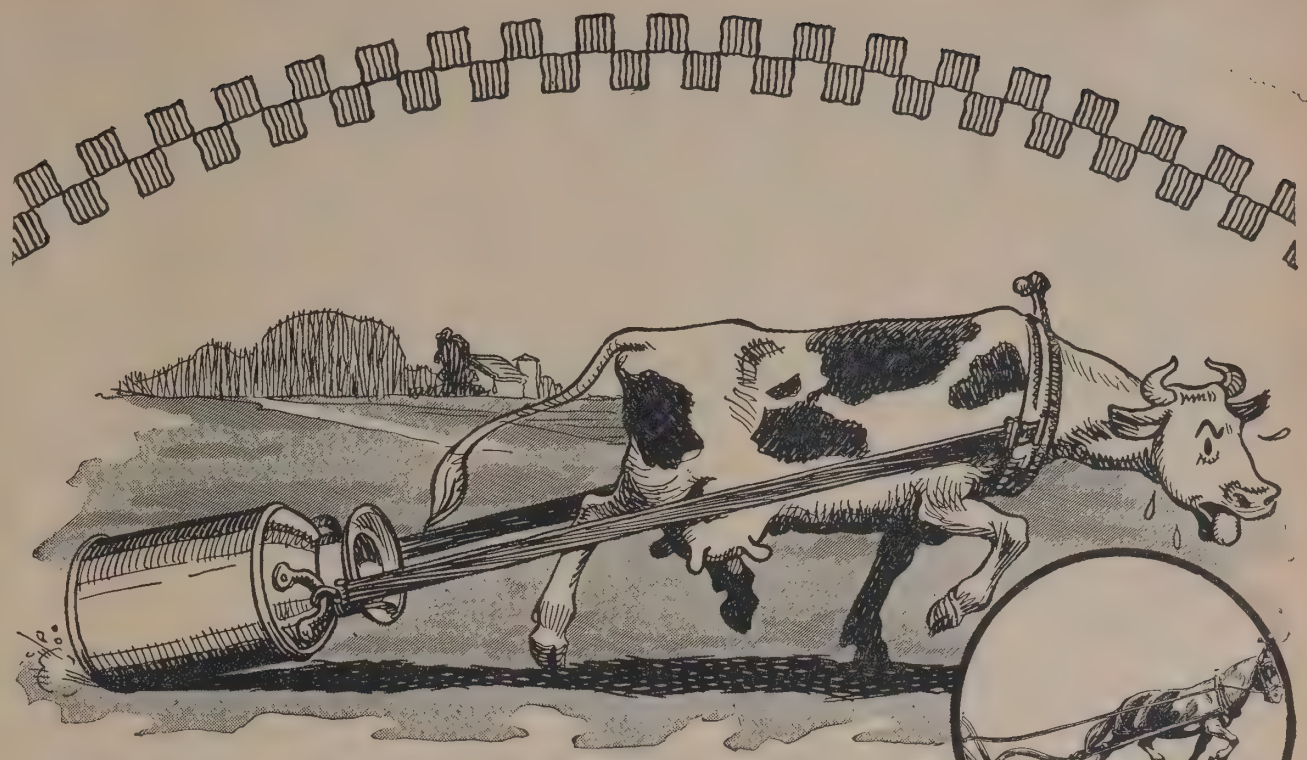
ngfield, Mo. W. E. S.

tablished contagious or streptomastitis is incurable and an af- cow should be isolated and fitor the butcher. Then cleanse, ect, and whitewash the stable, ling the floor and gutter. se and disinfect the udder and of each cow before starting to Catch abnormal milk in a vesntaining a disinfecting solution hen throw it out in a place not d by cows. Anti-mastitis serum acterin may prove remedial if at the outset of a starting case, junction with local treatment of lder. Milk an affected cow once ur from the outset of the attack it abates. Do not let a calf an affected udder. The dis- s not inherited. Elimination of ed cows, scrupulous cleanliness, isinfection of the stable is nec- to get rid of the infection.

Umbilical Hernia

ave a heifer calf four months old that navel rupture about two inches long. ould you overcome this? Our neigh- a colt with a navel rupture and a rian tied it off; that is, he drew the ether at the rupture and tied a cord it. This cured it permanently. Would ise this?

, Minn. F. F.



nall umbilical or navel rupture to subside by the time the ani- a year old. That may be hastened by applying tincture of iodine two or three times a week. Should the rupture continue to increase in size, however, a veterinarian should be employed to operate or apply wooden clamps or ligate by the skewer method. Merely tying a cord around the pulled-up sac and skin is not safe or certainly not effective treatment.

Garget

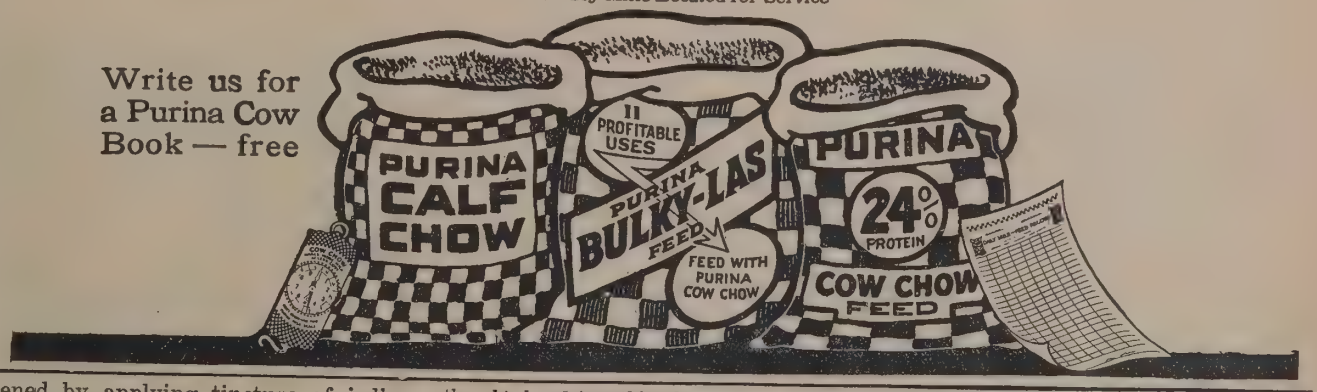
We have a registered Jersey cow that gets swelling in her udder occasionally (24-hr. garget) and we fear she may lose one quarter sooner or later as it is somewhat worse than the others. Would it be advisable to breed her the first heat period after calving? Can it harm the cow in any way to do this? We thought by doing this she could raise more calves. She is eight years old.

Chewelah, Wash. H. Bros.

A cow usually comes in heat about 28 days after calving and may be bred at that time. Dairymen commonly have their cows bred at the time that will have them calve in autumn or spring as desired. Delaying service in some instances results in suppression of the heat periods, especially in cows that readily lay on flesh. As the cow suffers from garget she should be quarantined and allow her to nurse her calves. She may be bred the first time she comes in heat.

It's hard to keep it up with nothing to eat but grass

A HORSE doing hard field work always gets his supper of grain. You wouldn't think of just turning him out to pasture. He couldn't keep up on grass alone.



Making milk is actually a bigger drain on a cow than spring work is on a horse. The energy used in making milk and repairing body tissues calls for even more grain than the horse gets.

Feed Purina Cow Chow throughout the summer. You'll have healthy cows that'll give you more milk right through the summer, fall and winter. You'll need less feed in the fall—and you'll be getting extra milk when other cows are in a slump!

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Pasturing the Herd Bull

It is still the practice of some dairymen to let the bull run with the cows any place the cows happen to be. Often we see the bull with the cows in a pasture close to the public highway and with but a slim, weak, or imperfect fence as a protection to the passerby, including the little children that go to and from school, on the little pathway by the roadside. When you come to think of it, that weak or tattered fence is merely a "bluff" to the bull. Were he to try it he could quickly break down the insufficient barrier and attack children or adults. It is certain, too, that the bull tethered by the roadside, where he has no legal right to be, could quickly break the rope or pull out the stake to which it is attached and run amuck. And what of the "perfectly gentle," "docile," "kind as a kitten" bull that is simply tied by a rope running from his nose ring to a stake? Why, he is a terrible menace, for he might, did he try, break loose at any time.

Apart from the real danger of letting the bull run at large with the cows, it is injudicious in that he will be likely to overserve cows that are in heat, overtax his powers and eventually become partially or entirely impotent in that way. Far too many bulls have to be sent early to the butcher, and overservice, lack of exercise, and imperfect nutrition are the chief causes. The bull needs work or daily exercise to keep him muscular and vitally strong but the pasturing plan, along with the cows, is objectionable. Every bull should have a roomy paddock or yard in which to exercise, and a small grass paddock having a strong "bull-proof" fence is excellent for the purpose and may be provided in connection with a separate house for the bull. It is also a good plan to fit the yard with pens, having gates to be raised by rope and pulley so that cows may be put to the bull without any danger to the attendant. Some dairy farms are so equipped and it would be well were every herd bull handled in that way that the amount of service might be controlled and the safety of mankind insured. Under the prevailing method of management the average bull is unquestionably *the most dangerous wild beast in America!*

Pasture, alone, does not fully feed the bull. When he is doing service he should be kept muscular and, to that end, it is necessary to feed him oats, bran, and oil meal, or any well balanced concentrate ration in addition to grass or other green feed. Service is a serious drain upon the system and when the bull runs with the cows and overserves, he is practically certain to become partially impotent toward the end of the grazing season. He may serve in an apparently normal way, but his vital fluid does not contain mature and vigorous sperm cells and cows served therefore fail to conceive. A certain amount of pasturing is excellent for exercise and loosening of the bowels in a healthy and wholesome way; but the abuse of pasturing, such as we have outlined here, is highly detrimental, far too commonly practiced, and in many instances the source of danger and disaster.

Sabadilla Effective for Lice

HOARD'S DAIRYMAN:—I have used sabadilla seed the last ten or twelve years and find it the only powder that will kill the big blue cattle lice. I put it on twice about three days apart and it gets them all.

Wisconsin. J. E. GORMLEY.

HOARD'S DAIRYMAN:—I have used sodium fluoride for several years with excellent results and no bad effects whatever. A little goes a long way. A few sprinkles of the powder over the neck, and if the animal is badly infested a little shaken around base of the tail, in a very few applications will destroy all lice.

Ohio. W. W. WEISS.

HOARD'S DAIRYMAN:—I have used sabadilla seed for six or seven years and I have never known it to fail. I have used it with equal good results on cows or calves. I have used a blanket after the application and have done without the covering with the same results. I never use any kind of cover if the cow is kept in the barn, but do whenever she is in the lot or pasture to prevent her from licking the powder. I have never known or experienced any bad results from handling the powder.

We use it quite liberally shortly after the morning milking and brush the cow in the evening before milking to avoid getting any of the powder into the milk. I repeat the application in about a week or ten days. It is very seldom that a third application is necessary.

One year I made the mistake and bought five pounds. I didn't use over half of this amount. When I tried to use the remainder the next spring I found it to be worthless.

I have also used oils as a louse preventive and as a destroyer but I have never had as good results from anything else as I have had from the finely powdered sabadilla seed.

Indiana. GEO. HAINJE.

Sore Teats

At present we are having some sore teat trouble in our herd. The teat swells and becomes hard and then breaks and makes a large sore that heals slowly and hangs on like a rash for weeks.

Thompson, Ia. A. T. K.

Immerse the sore teats for five minutes night and morning in hot water containing all the boric acid it will

WHEN YOU BUY DIP

3 *Things are more important than the price you pay*

First—How strong is it? How does it compare with carbolic acid?

Second—Is it standardized? That is, will it run uniform, or does it vary in strength?

Third—What kind of emulsion does it make? Milky white? Free from any specks or oily streaks on the top, and free from settlings at the bottom? A poor emulsion not only denotes an inferior dip, but a waste to you.

Dr. HESS DIP and DISINFECTANT

IS FIVE TIMES AS STRONG AS CARBOLIC ACID

It has a carbolic acid co-efficient of 5. That's why Dr. Hess Dip costs less to use, no matter what price you pay for others. It requires less of it to make an emulsion.

Dr. Hess Dip is standardized, always the same, whether you buy it in Maine or Texas, the same yesterday, today and tomorrow.

Dr. Hess Dip makes the finest, whitest milky emulsion of any dip that you can buy, and stays that way for weeks. The whiteness proves its worth.

Have your dealer place a teaspoonful in a glass of water—and see for yourself how much better it is.

Dr. Hess Dip and Disinfectant kills hog lice, sheep ticks and scab; destroys disease germs; keeps down foul odors; makes living quarters healthful. Guaranteed.

Dr. Hess & Clark, Inc., Ashland, Ohio

Pipe Smoker Fi the Right Toba for the Tropic

Happily learns that his fa tobacco smokes equally w warm climate as in cold temperate ones

Evidently, one of the proble pipe smokers who live in the is to find a tobacco that high t ature will not spoil.

Mr. R. G. Rigg of Colombia, was happy to find that he coul in South America the same t that had been his favorite sinc when he lived in Iowa.

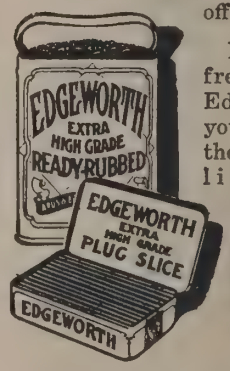
His experience may be a tip ers who have had difficulty fin tobacco that will keep its quali flavor in warm climates.

Read his letter:

October 6,

Larus & Bro. Co.
Richmond, Va., U. S. A.
Gentlemen:

Most all well-known tobaccos s well in a cold or temperate clin but very few in a tropical clin They are mostly too heavy, don't to be blended right—at least th my opinion gained from practical perience.



However, Edgeworth is the sam any climate. Again that is my opi gained by practical experience.

I cannot get the same pleasure of any brand of tobacco that I out of Edgeworth, and I have many—and paid fancy prices, too costs real money to smoke impo tobaccos here; the import duty is high.

Anyway, we cannot have everyt we would like in these countries we hold on to all the little plea possible. Now you know why I s Edgeworth.

Yours respectfully,
R. G. Rigg,
Cartagena, Colombia, S

To those who have never tried worth we ma offer:

Let us se free sampl Edgeworth you may put the pipe test. like the s you'll like worth wh and whe you buy it never char quality.

Write name a dress to Larus & Brother Co 15 S. 21st Street, Richmond, V

We'll be grateful for the na address of your tobacco deal if you care to add them.

Edgeworth is sold in variou to suit the needs and means purchasers. Both Edgeworth Slice and Edgeworth Ready- are packed in small, pocket-siz ages, in handsome humidors a pound, and also in several ha between sizes.

To Retail Tobacco Merchan your jobber cannot supply yo Edgeworth, Larus & Brother pany will gladly send you prep parcel post a one- or two-doz ton of any size of Edgeworth Slice or Edgeworth Ready-Rub the same price you would p jobber.

On your radio—tune in on WRVA, Richmo —the Edgeworth Station. Wave length 256

is anged within an hour—but he can learn to judge it fairly well. The air ould be fresh and clean to the sme; there should be no pronounced dra s over any of the stock; there sho d be appreciable movement of air ward at the intakes and upward thr gh the outtakes. Back draft- ing r outward movement at the intak , is indicated in cold weather by the melting of any frost that may hav previously formed around the ope ng.

"ssuming the conditions within the barn to be normal, or good, as desibed above, a decrease in outside temperature will, ordinarily, cau more rapid movement of air into d out of the barn and a conse- que lowering of inside tempera- ture To correct this the area of each inta opening should be gradually redied. Should the drop in outside tem rature be accompanied by high win a greater reduction of intake area will be necessary. As soon as the eather conditions moderate, the intaes should again be opened, the idea eing to maintain as great a circu a on of air as possible with the insi temperature at the desired deg e.

"ould the inside temperature not hen remain normal it may be adv able to close partially all intake on the windward side, thus relieving pressure on the inside.

" high temperature within the barn should not be maintained at the exp se of wet walls. Should the humidity become noticeable the barn may be dried out by increasing the circulation; that is, by opening the system.

"Should a portion of a large stable be temporarily unoccupied it would be well to close the outtake flue entirely in that part. This will reduce the circulation and aid in maintaining the stable temperature. The partial closing of an outtake reduces the velocity of the air in the flue, the result being too rapid cooling and consequent condensation and dripping.

"Damp walls cannot be avoided if there is insufficient insulation. Lack of insulation is indicated by the presence of dampness when the atmosphere within the stable is above the saturation or dew point.

"The success of a ventilation system depends upon the correct application of those principles which control the condition of the air. The principles themselves can be readily understood, but their application is still so largely a matter of judgment and experience that it is not possible for every farmer to be his own ventilation engineer. Farmers will therefore save much time and money if they will submit their ventilation problems to their state agricultural college, the United States Department of Agriculture, competent agricultural engineers, or to those commercial firms which specialize in the ventilation of farm buildings and which obtain results that show them to be using the best information available. The next few years will see a rapid advance in the use of properly installed ventilation systems designed to meet local conditions."

How Corn Crop is Used

The average yield of corn silage in the United States was 7.2 tons per acre in 1926, or a total yield of 31,205,000 tons for the 4,336,000 acres devoted to corn for silage. This is a yield of nearly a ton less per acre than 1925, but is three-fourths of a ton greater than in 1924.

In 1926 nearly one hundred million acres were devoted to corn, 4.37 per cent of which was devoted to silage, 12.38 per cent to hogging down, and 83.25 to corn for grain. The average yield of corn for grain was 26.4 bushels in 1926, as compared with 28.3 bushels in 1925 and 22.5 bushels in 1924.

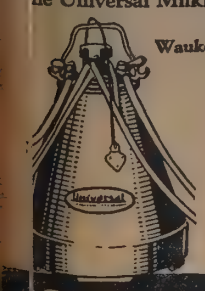
There were 522,451 silos in the United States on January 1, 1926, according to the estimate of A. L. Haecker. From this it would appear that the 1926 crop of corn provided 60 tons of silage per silo. As other crops than corn are ensiled it is probably safe to estimate that the average silo contained in the neighborhood of 70 tons, or a silo 14 by 30 feet.

"The Farm"

A new book has been added to the Rural Science Series edited by L. H. Bailey. It comes from the vigorous, prolific, clear thinking mind of Eugene Davenport. The name of the book, "The Farm," is so simple as to be misleading were it not for the subtitle. The book deals with the science and problems of soil productivity from a national point of view. It does not attempt to tell a farmer in detail how he may improve the fertility of his farm immediately but rather it presents a broad, long-time, philosophical viewpoint of the production of food, shelter, and raiment.

The writings of Davenport are known to many. Those who have been fascinated by his clear, effective style of expression will like "The Farm." Copies may be secured from Hoard's Dairyman Book Department on receipt of its regular price, $3.50.

Why Certified Dairies refer the Universal Milker



ERTIFIED dairies have a greater labor problem than ordinary dairies because of the extra care equired in looking after and milking he cows. Certified milk *must be clean* nd low in bacteria count above verything else!

n order to make a profit on his investment and labor the certified dairyman must do two things: (1) *Produce bsolutely clean milk.* (2) *Eliminate and labor wherever possible so as to old down production costs.*

is because the Universal Milker accomplishes these two things better than ny other milker that practically all rtified dairies in Wisconsin and Illiois milk their herds with the Universal Natural Milker.

ou cannot do better than follow the ample of leading certified dairies. rite for free catalog describing Universal Milkers in detail.

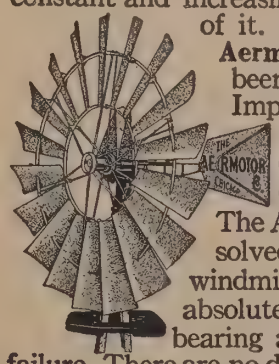
THE FULLER
AUXILIARY TRANSMISSION
FOR FORD TRUCKS

THE FULLER'S LEVERAGE WORKS BOTH WAYS

The FULLER'S job is to save you money, not alone by helping your Ford Trucks do more work, but also by actually lengthening their lives under heavy overloading.



Located at the rear end of the drive shaft, the leverage of its reduction gears works both ways. It powers the super-strong rear axle to snag huge loads through heavy sand and deep mud; and it effectively lightens the strain on motor, transmission, universal joint and drive shaft.

A WONDERFUL SUCCESS

"Nothing succeeds like success," they say, but where success is constant and increasing there must be some unusual merit back of it. The continued success of the **Auto-Oiled Aermotor** is based entirely on merit. It has been made better and better year after year. Improvements have been added as experience has shown the way. The **Auto-Oiled Aermotor** of today is a wonderfully durable and efficient windmill.

The Aermotor Company, more than 12 years ago, solved the problem of complete self-oiling for windmills in such a way as to make the system absolutely reliable. The oil circulates to every bearing and returns to the reservoir with never a failure. There are no delicate parts to get out of order. The double gears run in oil in a tightly enclosed gear case.

The Ventilation of Dairy Barns

(Continued from page 497)

In the colder climates not much over 600 cubic feet of air space should be allowed per cow, which means that the stable height should not be more than 8 to 8½ feet. Barns such as discussed elsewhere in this issue will supply a stable suitable for good ventilation. We would emphasize here the building of a warm ceiling, with underside of joists ceiled and spaces between joists closed at either end. If the floor of the second story is not covered with hay, this part should have additional insulation. Hay chutes should be kept closed with hinged or sliding doors, else they will interfere with proper operation of the ventilation systems.

In cold climates it is desirable to have double glazed sash or storm sash, as a single glass radiates heat 2½ times as fast as a board one inch thick and several times as fast as a properly built wall with a dead air space.

Properly designed metal ventilators on top of the barn are more efficient than the old fashioned wooden cupolas and provide greater protection against snow and rain. The throat opening should be large enough to permit the free passage of air and at the same time it should be so designed as to prevent wind blowing down the flue. Not every tinsmith knows the correct dimensions and home-made ventilators are apt to be inefficient if not complete failures.

The following discussion of outtakes, intakes, and operation is taken from "Principles of Dairy Barn Ventilation," by M. A. R. Kelly of the U. S. Department of Agriculture and published as Farmers' Bulletin 1393:

"Outtakes are usually arranged in pairs. When the cows are to face inward, the outtakes are placed on the outside wall on each side of the barn and often enter the same ventilator at the ridge. The flue should be made air-tight and as straight as possible, with no abrupt turns.

"It is essential that the flues be well insulated and air-tight in order to prevent, so far as possible, the cooling of the air during its passage and the condensation which will take place regardless of the material used in the construction of the flue. If the flues are constructed of wood they should be double-boarded with matched lumber and with a good grade of building paper or roofing felt between the two layers. A single layer of matched lumber is sufficient for that part of the flue above the mow floor.

"In the better installations of ventilation systems, round metal flues are being used. A round flue is more efficient than one of square or rectangular shape and of the same cross-sectional area and for this reason a smaller flue may be used. Bare metal pipes are unsatisfactory and require insulation, as do wooden flues. Metal flues may often be erected with much less labor than wooden flues and in many localities can be installed more cheaply.

Intake Flues

"The intakes should be smaller in size than the outtakes and of greater number. They are generally placed 10 or 12 feet apart and so distributed as to insure a good circulation of air in all parts of the stable.

"Intake flues should be made air-tight. If the barn wall is not ceiled or sheathed, at least the outside wall of the intake flue should be, as cracks in a single layer of sheathing will affect the efficiency of the flue. The inside wall of the flue should be insulated, otherwise cold air passing through the duct cools the inner surface of the stable wall, causing condensation and consequent dripping. During cold weather the path of uninsulated intake flues often is indicated by the frost on the wall and ceiling.

"Automatic intake valves, which are designed to prevent back drafts, have recently been placed on the market. When these valves are used the vertical part of the flue is insulated.

"Warm-air furnace registers should never be used in the openings of outtake or intake flues. They rust, break, and collect dirt and cobwebs, and during cold weather registers on intakes collect frost to such an extent that sometimes renders the entire area ineffective. The grate or slide shutters retard the passage of air. A board, either hinged or sliding in a slot, is preferable to the furnace register as a means of regulating the area of the openings.

Operation of the System

"If the ventilating system has been installed by a commercial firm the owner should obtain a set of instructions, go over it in detail with the firm's representative, and have the construction and operation thoroughly explained, so that when he undertakes the operation himself, he will be better able to adjust the system to varying atmospheric conditions.

"The barn must be kept clean, for although ventilation will remove and displace foul air, freshness of the atmosphere cannot be maintained if manure and foul-smelling debris are left in the stable. The barn should not be filled with stock, or unoccupied portions should be filled with clean straw or cut off with a temporary partition. The heat generated by the stock is the means by which a difference between inside and outside temperatures is brought about, thus causing circuation of the barn air, but if the space is too large for the number of stock there may not be sufficient heat generated to maintain the desired temperature and at the same time produce ample air circulation.

"It will not be feasible for the average farmer to determine the amount of ventilation—that is, the number of times the air in the

Camels are superb tobaccos in a joyous blend

NO DOUBT about it, you can't beat Camels, regardless of how much you pay. Here are the world's choicest tobaccos combined with a skill that makes Camel the masterpiece of cigarettes. Smoke a pack or a million and each successive Camel opens a new understanding of tobacco enjoyment. Never a tired taste in a thousand packs of Camels.

For smoking pleasure supreme, get acquainted with Camels. There is or can be no better tobaccos or blending. Camels are first in popularity, and your own pleasure, as soon as you try them, will confirm the experience of millions.

In fact, you'll agree, after a trial, that this is the one sure call to smoke contentment: *"Have a Camel!"*

...d of cork brick. Ordinary wood ... have the disadvantage of ab... ...g considerable moisture which ... expansion and warping. How... ...wood blocks are now to be had ...ave been treated with a special ...nd that renders them almost ...ious to moisture. These blocks are warm and durable and by using care in laying, a good job can be secured. Wood blocks should be laid in asphalt, with joints filled to within one-fourth inch of top with asphalt and the balance of joint filled with sand. If the joint is filled to the top, the heat of the animal will cause it to become sticky. Cork brick are laid in a one-half inch bed of cement mortar mixed one part Portland cement and two parts sand. The brick should be laid together, with no perceptible joints; any cracks or crevices between bricks to be filled with a rich cement wash.

Good roofing material can be had in a variety of kinds. The pitch of a barn roof is usually steep enough so that any type of roofing can be used with success, therefore it is for the owner to decide whether he wants a cheap roof, a medium priced roof, or the best that money can buy.

A 1000-lb. Fat Producer

The latest record in excess of 1000 lbs. butterfat has recently been completed by Redfield Diana, a 7-year-old Holstein cow bred and owned by the State School and Home for Feeble Minded in South Dakota. In 365 days she produced 30,895.7 lbs. milk containing 1,039.78 lbs. fat (1,299.72 lbs. butter) which ranks her 58th among Holstein producers and the 112th cow of the breed to pass the 1000-lb. mark.

Uncle Ab says the man who can't manage to live on good terms with himself can't expect to be on good terms with his neighbors.

INFERIOR quality often hides behind a mask of mere surface goodness.

For example, a shoe has two soles. But do you ever ask, do you ever stop to think—"What is behind the outer sole? What is the second sole?"

We cut apart several shoes that *looked like* Ward's—shoes made to sell for 25 cents less. The second sole was made of leather that cost 20 cents per pair. *When the first sole is worn out, the second sole will "disappear" with a few days' wear.*

Ward's second sole is made of 45 cent leather — as sturdy and strong and long-wearing as the outer sole.

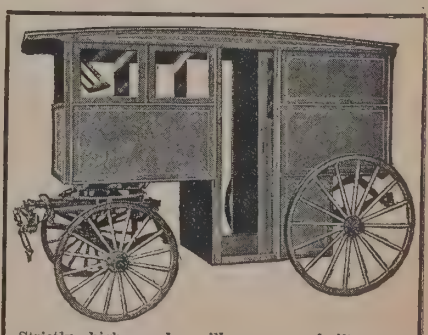
The price of the inferior shoes is *seemingly* lower than Ward's. A quarter can be saved in cash, but at a loss of two dollars in *serviceability.*

At Ward's "we never sacrifice quality to make a seemingly low price." For fifty-five years this has been the Golden Rule policy back of every article we have sold.

We do not adulterate, "skimp," or use inferior substitutes to take a few cents off the price.

Ward's prices are as low as reliable merchandise can be sold—always. And no merchandise power in the world can buy at lower prices than Ward's!

Over 60 million dollars in cash is used to buy goods in the largest quantities to secure low prices. But we never make a price a few cents lower by sacrificing *service* and *your satisfaction.*



A Price too low—makes the Cost too great.

Common Sense in New England Dairying

(Continued from page 493)

might be overthrown. The stage was set for a first-class milk war, but both sides kept their heads. NEMPA officials thought that they could compel Turner Centre to pay their price, but they veiled their threat to go into court with an offer to reduce their October price from 8½ to 8 cents a quart if Turner Centre would pay the NEMPA scale for August and September milk.

Turner Centre went back into the NEMPA fold with October, but deferred action on the milk for August and September. A meeting of Turner Centre stockholders was held on November 12, at which the action of the board of directors was endorsed, largely by the use of proxies, but still an open declaration of war on NEMPA was avoided and an adjourned meeting was called for November 27. At this meeting more stockholders of Turner Centre were present in person and the sentiment was freely expressed that if the system was in serious financial trouble the producer-stockholders would dig down into their own pockets rather than force an open rupture with their co-operative marketing association. That meant business, for fully 75 per cent of the 3,000 odd Turner Centre producers are also members of NEMPA.

This show of hands led to the appointment of a committee of Turner Centre stockholders to go over the financial situation thoroughly and NEMPA officials were invited to sit in with the committee.

Events during recent months point to a satisfactory adjustment of the controversy in time. In spite of the poor ice cream season, 1926 was a better year for Turner Centre than 1925. Instead of having earnings of only a little over $18,000, last year showed $56,890.60, and the directors found it possible to pay a dividend of $53,913.65, leaving in the surplus fund on December 31, $98,140.27.

The annual meeting which was held this last February was attended by more than 300 farmers. It was harmonious, there was no bitter criticism, and the same board of directors was re-elected with the same officers chosen for the coming year.

The committee which was appointed to adjust the difficulties with NEMPA on the August and September milk price recommended that the matter be deferred, but that a special committee of active stockholders should be appointed to meet periodically with the directors in the effort to determine when the payment should be made. The committee felt that the new management is making progress, but they did not want to handicap the company with heavy demands until it is in a position to carry them.

In other words, Turner Centre and NEMPA are not going to make the August—September milk price a *casus belli.* So there you are. The farmers were not responsible for the situation which threatened the business stability of the company which they had been buying for five years. On the contrary, they took prompt steps to remedy matters as soon as they were in a position to do so. When they thought their new board was going too far, the stockholders urged and got conciliatory methods. Both Turner Centre (stockholders and officers) and NEMPA deserve a lot of credit for the common sense they have displayed in averting a calamity which would have lost money for many people and engendered bad feeling that would have taken many years to overcome.

Farm Statistics

The 1925 farm census indicated a decline in farm population in the United States from 31,614,269 in 1920 to 29,981,693 in 1925. In the latter year there were 6,371,640 farms, of which nearly 3 per cent were located on concrete or brick pavement, 20 per cent on macadam or gravel, 31 per cent on improved dirt roads, and 46 per cent on unimproved roads.

Farm products sold co-operatively in 1924 totaled $857,652,166, an increase of 136 million dollars in five years. Supplies purchased co-operatively amounted to $75,932,799, a decrease of nine million dollars in five years. Feed expenditures were $750,440,560, a decrease of 247 million dollars from 1919. Expenditures for fertilizer were $230,528,446, a decrease of 96 million dollars. Expenditures for labor decreased 234 million dollars in five years, totaling $864,982,384 in 1924.

Milk production is given as 79 billion pounds in 1924, an increase of 12 billion over 1919. Butter made on farms totaled 642,803,267 lbs. in 1924, a decrease of 65 million pounds in five years. Butterfat sold from farms totaled over a billion pounds in 1924, or nearly double that sold in 1919. Whole milk sold from farms was 23 billion pounds, an increase of over a billion pounds in five years. Nearly two billion dozen eggs were sold from farms in 1924, an increase of 259 million dozen in five years.

The number of farms decreased 76,703 from the 6,448,343 recorded on January 1, 1920. There were 1,128,207 farms reporting a mortgage debt of $10,790,244,351 in 1925, as compared with 1,193,047 reporting a mortgage debt of $4,003,767,192. While there was a material reduction in mortgage debt, the ratio or per cent of mortgage debt to the value of farms was 41.9 in 1925 as compared with 29.1 in 1920.

Tractors on farms increased from 246,083 in 1920 to 505,933 in 1925. Farmers reported radio outfits to the number of 284,006 on January 1, 1925. The total value of farm machinery and implements was given at $2,691,703,629 in 1925, a decrease of 903 million dollars during the past five years.

The new champion 2-year-old of the French Canadian breed is Robinette, owned by the Agricultural College at St. Anne de la Pocatiere, Quebec. This heifer has just completed a year's production of 10,442 lbs. milk, 489 lbs. fat, which exceeds the former class record by 14 lbs. fat.

eding Pregnant Sows for Fall Litters

man who makes a success with pigs is just a little better herdsthan the man who makes a succwith spring pigs. About 75 per of our annual pig production is spring farrowed litters. More 25 per cent of our farms, how-, grow some fall pigs.

he success of fall pigs depends on having them farrowed early, the of August and first three weeks September, (2) in giving them a start before cold weather sets in, in providing warm, dry, clean, ventilated sleeping quarters, (4) iving them a good growing ration ng the winter, and (5) in how mothers are handled from now the pigs are born this fall. We now concerned with the feeding care of the sows that will farrow er cent of this year's pig crop.

ith the advance of the season's there is a little tendency to let e prospective mothers shift for nselves. This is a mistake. Fall well born are certainly better pects for carrying through the er than those whose mothers have neglected. With plenty of good ure forage the needs of the pregsow are simple. Simple as these one should keep in mind that w is working most of the time n she farrows 2 litters a year. wing 226 days for the two pregy periods and 60 days each for two suckling periods leaves only ays for the sow's vacation.

he needs of a mature pregnant in reasonably good condition when was bred are feeds for maintee and for developing the unborn . On the other hand, a gilt or a ling sow not well grown needs feed for growth as well as feed maintenance and litter develop. The condition of a gilt or masow at time of breeding also ld be considered in planning the n for the pregnancy period. e good practice requires that be in reasonably good condition at this time they frequently finish off the spring litter in thin flesh. This must be regained during the summer.

Corn alone, as nearly every one knows, is a poor ration for a pregnant sow. Its exclusive use results in a tendency for the pigs to be small, weak, and underdeveloped; in a higher percentage of dead pigs; in a feverish, irritable condition of the sow at farrowing time; in greater tendency for sows to develop the pig-eating habit; and inability to secrete a normal supply of milk. All of this means a much lower percentage of pigs raised.

On the other hand, it has been shown that forage crops alone are not adequate to nourish the pregnant sow. Succulence and some bulk are good in the ration but too much bulk is not so good.

The amount of grain and supplemental feeds to give pregnant sows on pasture should be governed by their condition, age, and weight. Sows in medium to thin flesh at breeding time should be made to gain 75 to 85 lbs. during the pregnancy period. The amount of feed should be increased with the advance of the period. A good general rule to follow for mature sows is to feed concentrates at a daily rate of one per cent of the sow's weight. A sow weighing 350 lbs. would receive 3.5 lbs. concentrates daily. Gilts must be fed more liberally; one and one-half per cent of their weight being given as concentrates daily.

The nutrients needed mostly by the sow are of the carbonaceous and energy kind while those needed to develop the unborn litter of pigs must be of protein and mineral nature to build lean flesh, blood, connective tissue, bone, and such like. Corn is a good energy feed but poor in mineral and protein. The small grains are also good energy feeds but a little higher than corn in protein and mineral. Legume pastures supply bulk, succulence, calcium, phosphorus, and protein. Skimmilk supplies calcium, phosphorus, a very good quality of protein, and a little carbohydrate. Tankage is an excellent source of protein and mineral matter.

A sow weighing 300 lbs. fed corn and skimmilk on legume pasture should receive daily 3 lbs. corn and about 12 lbs. skimmilk to make the desired gain. Ground barley may be substituted for the corn. Four weeks prior to breeding, the feed allowance should be increased.

AN OHIO HOG HOUSE

his hog house was found in use on the ni County, Ohio, test farm. This size type of sash with glass complete at present time can be bought for a dol- This window is a feature that aps to many farmers at once and works ight if adequately protected. In ac- usage, however, the writer has obed that such windows are distressingly ct to breakage, both by the hogs within when excited and by larger als from without when they have acto the same field.

io. G. P. WILLIAMS.

Vitamin Deficiencies in Pig Feed

The cereal grains are low in bone building minerals and more or less low in vitamin A, which promotes growth in young animals. The exception is yellow corn which has, apparently, enough of this vitamin to promote normal growth.

Closely skimmed milk is deficient in vitamin A but it is rich in bone building minerals and it supplies a high quality protein. Skimmilk and yellow corn will make normal growth and bone formation but with other cereals and white corn there will be unthriftiness.

To correct the deficiencies it has been found that the addition of a small amount of alfalfa meal or good quality alfalfa hay will bring about normal growth and bone formation.

The above applies only to dry lot feeding as is practiced during the winter. Pasture grass corrects the deficiencies found in the cereal grains and in skimmilk.

Feeding the Open Sow

Some farmers use gilts exclusively for spring litters of pigs after which time they are fattened for market. Other farmers use some gilts, some yearlings, and older sows. Where only one litter each year is raised some of these sows must be carried through the summer. The problem of carrying these open sows through the summer is up for consideration at this time.

The nutritional needs of the sows and the element of economy in supplying these requirements are the chief factors involved.

Mature sows will have lost 60—90 lbs. during the suckling period just closed. This will have to be regained. Gilts will likewise have lost weight. This must be replaced in addition to which provision must be made for continued growth.

Mature open sows will just about maintain their weight during June and July on good bluegrass or legume pasture. In order to gain the lost weight, however, they will require some grain. If the pastures are good it will seldom be necessary to feed daily more than an amount equal to one per cent of their weight. Their need for protein is at a minimum. With good legume pasture, corn and a very little skimmilk are sufficient. Four or five weeks before breeding this fall the feed should be increased.

With yearlings and the younger sows just farrowed for the first time, the feeding should be more liberal and there is a little greater need for protein. Feeding grain daily at a rate of one and one-quarter per cent of the live weight and allowing 6—8 lbs. of skimmilk in addition to which pasture is provided, is adequate for the younger growing sows.

Little Freddy was preparing to go out calling with his mother. Suddenly he called to her in a rather startled voice:

"Mamma, is this bay rum in the brown bottle?"

"Gracious, no, dear! That's mucilage."

"Oh," said Freddy, after a pause. "Maybe that's why I can't get my hat off."—Buffalo News.

WHITE COLLIE PUPPIES

We are expecting another litter of white Collie puppies about June first. If you intend to buy a dog this summer we suggest you act promptly as our supply is limited. All dogs eligible for registration. We will furnish necessary papers for registering if required. Price F. O. B. Fort Atkinson: Females $10.00, males $15.00.

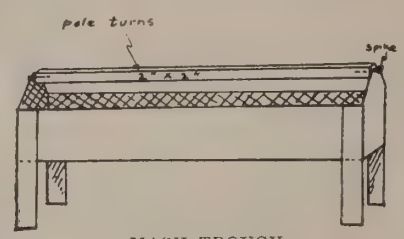
20TH CENTURY HATCHERY, Box 27, NEW WASHINGTON, OHIO

should remove the mash from them and feed them very lightly on a scratch mixture and in addition force them to drink just as much milk as possible. If this can be best done by the total exclusion of any water for drinking, it is advisable to do so.

The California Station has found that the addition of about 40% of skimmilk powder, added to their mash, has given them the most satisfactory results. Irrespective of the source, milk seems to be the one material that a person can adopt for this purpose.



Insofar as is now known there is not any sort of treatment either medicinal or otherwise that a person can adopt that is going to be of any advantage.

An outbreak of this sort or an outbreak of worms in chicks is not ordinarily as easily controlled after it has put in its appearance as it is to prevent it by proper sanitary precautions. This means particularly raising chicks on new soil every year, absolutely away from the range that the old stock has been using. If a person would just adopt these practices they will eliminate considerable amount of loss in the young stock and will be able to show more satisfactory results.—J. B. HAYES.

Roosting on Hoppers

HOARD'S DAIRYMAN:—Pullets like to roost along the sides or ridge pole of the dry mash hopper.

The drawing shows how one poultryman prevented this. He built a turning pole along the center of the hopper as shown in the drawing. A

MASH TROUGH

quarter-inch hole was bored in each end of the trough. A spike was put through the hole and driven into the end of a 2"x2" pole. The edges of the pole were left sharp. Since the spike was a loose fit the pole turned at the slightest touch and none of the birds could roost on it. Its presence discouraged them getting into the hopper and scratching out the mash and also roosting along the sides.

Iowa. A. M. WETTACH.

Cooked Potatoes for Chicks

Please tell me if cooked potatoes could be successfully fed to baby chicks. I thought I would mix some with the starting mash. We have a lot of good, solid, small potatoes that I would like to use up if it is a success.

Bloomer, Wis. (Mrs.) A. M. K.

Cooked potatoes can undoubtedly be fed to baby chicks, but I don't believe there would be any particular value attached to them. It would be simply trying to think of some means of disposing of potatoes other than throwing them away. If you can feed them to hogs, cattle, or anything else, or can think of any other way of disposing of them, with less labor, I absolutely would not advise trying to combine them with the chicks or the laying hens as a feed for them.

When potatoes are well cooked and to those potatoes when in a crumbly condition is added some dry mash, and this is all worked up into a good, crumbly sort of a mash mixture and given to the chicks, some results will undoubtedly come from it, but the results are due to the tion of the dry mash and not to particular value which may be tached to the potatoes. This ing of potatoes is one of the old that still persist and hang on some people still persist in them as a feed. Any work that been done that I know of seen disprove this practice, rather making any attempt toward re mending it.

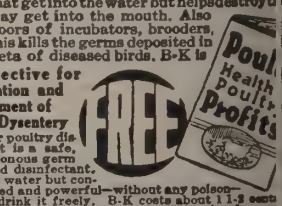
These, of course, could not be for extremely young chicks, bec a moist mash for them is usuall required at least for the first weeks.—J. B. HAYES.

Sambo was asked what kin chickens he preferred.

"Well, sah," he replied after a moments' consideration, "all has dere merits. De white ones easiest to find in de dark; bu black ones is de easiest to hide you gets 'em."—The Progre Grocer.

A hen does not quit scrat just because the worms are sc She scratches just that much h to get a living.—Northwestern fectioner.

It's not the spurt at the star the steady advance that wins suc —VIVIAN.



Save Your Chicks Fr

WHIT DIARRHE

"6-8-12 Chicks were Dying Every Day"
Started B-K —No more losses

writes Mrs. Fred Brandenburg, Randolph, Wis. "When I sent for B-K, m first incubator full of chicks started wit white diarrhea and I lost 6 and 12 a da until I had only one left. I had two mo incubators full coming off. The chicks w about four days old and I had lost about of those when I received the B-K. I at o fed it in their drinking water and also was the brooders out with B-K. The sick chicks beg brighten up and I never lost a single chick white diarrhea afterward. I can safely say that saved my last three incubators of chicks."

Start feeding B-K in drinking water fr the very first drink. This not only kills germs that get into the water but helps destroy t which may get into the mouth. Also spray floors of incubators, brooders, coops, this kills the germs deposited in the excreta of diseased birds. B-K is also effective for prevention and treatment of Cholera, Dysentery and other poultry diseases. It is a safe, non-poisonous germ killer and disinfectant. Clear as water but concentrated and powerful—without any poison—chicks drink it freely. B-K costs about 1 1-2 cents gallon of dilution ready to use. Get a jar from y dealer today. Money back if not satisfied.

Write for FREE Bulletin
on prevention and treatment of poultry diseases. It may save you hundreds of dollars this season.

GEORGE B. FERRIS, 965 Union, Grand Rapids,

btedly due to source, handling, and ious things of that sort. For this son the crude cod liver oil has been form that has been most exten- ely used. There have, of course, n a number of instances where peo- have used the refined but the price this is always excessive and it is stionable whether the results ich you get from it justify this ex- se, not because the oil does not rk satifactorily but it is merely a nparison with the price at which other form of it can be obtained. n using the emulsified, if it were rely a question of having this on hand and you wish to dispose of it, you could use it and it undoubtedly will work satisfactorily. However, when you come to compare this in price with some of the others, I believe you will find considerable variance and quite a large gap.

It has been used here in test work at the rate of 2 per cent of the mash, when the mash alone was fed to chicks. This, apparently, has been satisfactory.—J. B. HAYES.

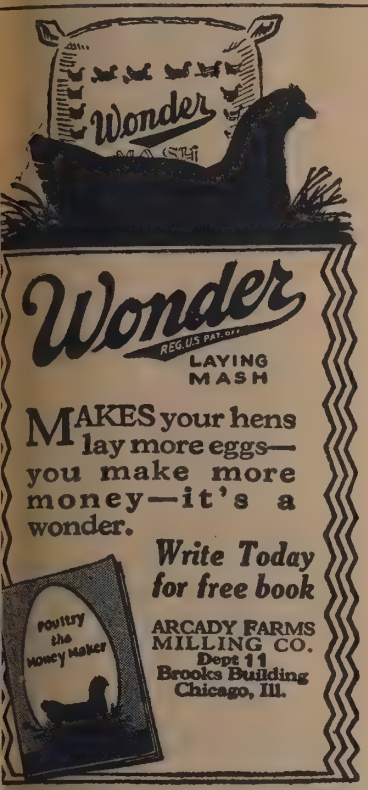
Coccidiosis

There seems to be some disease among our chicks. They are about five weeks old. There is blood in the droppings. I first noticed one chick that had it and in a day or so it was dead. Soon I noticed another and that went the same way. I am feeding chick mash and prepared scratch feed consisting of cracked corn, barley, wheat, buckwheat, sunflower seed, etc. They are fed a large quantity of sour milk and some green grass. These chicks are not having the brooder now. These chicks seem to be healthy enough. There are no other symptoms to write.

Holmen, Wis. C. M. A.

From the symptoms indicated it is undoubtedly an outbreak of coccidiosis that you have noticed in your flock of birds.

The symptoms indicated are rather meager on which to base a diagnosis in that you have not posted out any of the birds. If in posting out some of the dead ones you find that the caeca or those two pouches or more commonly called "blind guts" that we find branching off the intestinal tract are found to be filled up with a bloody material, either resembling a large clot of blood or a hard, cheesy material, a person can be pretty positive that this is the trouble. It is always safer, of course, to send in one of the sick birds to the Veterinary Department of the State Agricultural College for an examination. This makes the findings more definite and removes a considerable amount of the uncertainty.



This coccidiosis is a disease becoming more prevalent in farm poultry flocks and is one reason why the absolute necessity of a portable colony house on clean range has been stressed so much. This is the one method by which it can be kept under control.

The infection is carried in the old birds. They may not die from the effects of it, but they undoubtedly still spread it. They, in this way, keep the ground infected and when young chicks are given range over the same ground that old birds have had access to, one will find that they will in turn pick up the disease and the trouble results in that way.

In those cases where the outbreak is noted, it is necessary to pick out all of the apparently healthy birds and move them in a clean house to clean range. This means removing all the litter that was in the colony house, burning it up, cleaning it out thoroughly, and then moving these chicks out on range on which no birds have been running.

Twice weekly the litter should be removed from the house and burned up and if possible it is advisable to move the colony house every four or five days for a few weeks.

In the feed for the chicks one

Poultry on the Dairy Farm

Preventing Molt in Pullets

I have 600 February hatched pullets that I consider using for breeders in 1928. What steps do you advise to carry these birds through this fall and winter without a molt?

What maximum production is safe; that is, how heavy may these birds lay and still be able to produce good hatches of livable chicks? You say that hatchability consists more in filling feed requirements than in age of stock and it is on this point in particular that I desire more information. These birds are Leghorns raised on the Wisconsin mash ration and at eight weeks are well grown with excellent bone. While I want as many eggs as possible the value of these birds as future breeders is of first importance. I am after all the information I can get on this and hope this from a section remote from yours will not be considered amiss.

Vancouver, Wash. J. D. C.

Unless your conditions are entirely different from ours, and all of the advertising that we hear about the states of Washington and Oregon is nearer to truth than fiction, there isn't anything outside of an act of Providence that is going to allow you to carry February hatched pullets through the winter without a molt developing in these birds. Even on some work which Bittenbender did at Iowa, with a bunch of out of season hatched pullets that he carried through to something over 300 days, before production started, he was unable to prevent a molt in them. I believe a person stands the best chance of postponing molt on the biggest bulk of them by the use of artificial lighting during the winter, which in turn is going to make it possible for a person through heavier feeding to keep the birds up to better physical condition. This loss of weight is undoubtedly one of the predisposing causes for birds molting. In other words, the Iowa people have found that a pullet molts because she stops laying and doesn't stop laying because she molts. This merely means that there must be some reason for cessation of production, which then causes a molt rather than vice versa.

In the use of the 80—20 ration, we can, of course, postpone sexual maturity in the flock very satisfactorily, because it is well enough fortified with minerals to make it possible for growth or frame growth in the birds to continue without bringing them in to lay. In the old rations it was always a question of dropping out the meat scrap which, of course, meant dropping out most of the minerals, and this lack of minerals simply resulted in a cessation of growth, and that meant that you were getting a small pullet developing. With the ration as now designed, it is possible to drop off a part of the animal protein feed, which means either a meat and a bone meal or a meat scrap, dried milk, or liquid milk at the end of twelve or fourteen weeks, but retain the mineral level in the ration as originally designed and this will tend to give a larger pullet a longer growing period, and postpone pro tion until we wish it to stop.

I may be Bolshevik on this tion of hatching from pullets, see absolutely no reason aside the fact that you are not as ce of the breeding value of pullets to the fact that they haven't a y record on them, you don't know size egg they are laying, you ha record on their hatchability, various things of that sort, but from that I can't see any reason we can't get a good reasonable of production from pullets along ing the winter and use thos hatching at the same time next

This year, just as an examp that, one of the men in Wisc put a bunch of about 175 to 18 lets upstairs in the barn. He have housing space for them, s south end of the barn was made into a pen. The ends, the sides the top were covered over with as it was part of the hay mow. birds started their production i gust and September, some of while still on range. They moved in there early in Oc That bunch has been hitting a erage of 60 per cent production that time up until the present. the birds were given semi-solid termilk and at least 2 per cent liver oil in the mash they through the entire winter w any molt and without any indi of leg weakness or paralysis. produced a wonderful quality on the eggs, have not been bot with egg eating in the flock, a first hatch taken from those along late in March was a 69 pe hatch. Whether that thing co done each year or whether w repeat on it, remains to be see I can't see why, if a ration is fo and weight is maintained in the and the ration is such that it s why we can't get winter prod and hatchable eggs in the sprin

With the trend of market pr the present time, especially in ence to egg production, I am lutely recommending to our co cial farms that they get their hatched early, matured early, s producing along in Septemb early in October; that they them through just as strongly can, and if the birds want to a molt along in December or ary, they are still ahead of the I don't mean that the comm farms can afford to have all of but they can at least have on hatch to take a chance on and upon later hatched pullets a hens to carry through their p tion.—J. B. HAYES.

Cod Liver Oil

Please tell me whether em cod liver oil is good for baby Or what kind of cod liver oil d poultry raisers use? I have a of emulsified on hand and that I ask. How do you feed it t chicks and what amount?

Onaway, Mich. (MRS.)

The question of price has b determining factor in the use liver oil for baby chicks, and o son for it is that there is a gre of variation in the effectiveness oil for feeding purposes, which

OARD'S DAIRYMAN
Fort Atkinson, Wis.

Dairying Pays in Georgia

HOARD'S DAIRYMAN:—Five years ago G. C. Alford, a Georgia farmer, decided to beat the boll weevil by going into dairying. Last year he made a clear profit of more than $3,750 from his dairying operations—and still had the five bales of cotton to sell despite the weevil.

"I started in the dairy business," says Mr. Alford, "about five years ago. The boll weevil destroyed my cotton crop, and I decided that the best way to fight the weevil would be to raise something which it could not eat. I had a few grade cows and two pure-bred Jerseys, also a pure-bred Jersey bull, so I decided I would go in for dairying.

"I traded some hay to a sawmill man for lumber and built a barn large enough to hold forty cows, with a concrete floor—also a small dairy room with a concrete floor. I already had a good pasture, consisting of Bermuda, Lespedeza, and Dallas grass, but I did not have the money to buy the cows I needed to start with, and I had just purchased some high priced land on which I had to pay interest and taxes.

"So I sold some mules that I did not need and invested the money in some high grade Jersey cows. I found more cows for sale than I could purchase, as many people were leaving because of the boll weevil and were anxious to sell, so I picked up some twenty head at a bargain. I now have 45 head and 15 yearling heifers and calves.

"I weigh each cow's milk and test it for butterfat and if a cow proves to be unprofitable I sell her to the butcher. If a cow will give enough milk each day to contain a pound of butterfat, I consider that she will pay me a profit. To produce this, she must either give about 25 pounds of four per cent milk or twenty pounds of five per cent milk. In selling cream it is not the cow that produces the most milk that counts—it is the cow producing the most butterfat.

"My cream is all sold to the Ezell—Griffin Creamery at Eatonton, Ga. I deliver the cream every other day, using a little ice in hot weather to keep it sweet, and haven't had a can to sour in over a year. In the past 364 days I have sold $6,901.50 worth of cream with a feed bill for milk cows, dry cows, and calves of only $2,698.00. I buy most of my feed in carlots—cottonseed meal, hulls, and corn—buying two cars of cottonseed meal, two of hulls, and one of corn for my hogs and mules. I bought all of the feed used during the past year except about twenty tons of oats, vetch, and Bermuda hay.

"The cost of delivering the cream by truck was about $500, as I live twelve miles from Eatonton, where the nearest creamery is located.

"I keep four brood sows to raise pigs, which utilize my skimmilk. I raised forty pigs last year, keeping them until they weighed between 150 and 175 pounds gross and then feeding them on corn to get them ready for market. I sold $810.40 worth of pigs last year and the feed bill for them was not more than $250. As for my labor costs, I have two men, whom I pay $25 a month, and my three boys help with the milking.

"I also made five bales of cotton, but cannot give you any figures on it, as I have not sold it yet and do not know what it will bring."

Well—that is what dairying has done for one farmer in Georgia. It has not taken the place of cotton, for Mr. Alford has five bales that he raised last year. But it has enabled him to make a living despite the boll weevil, and it is enabling him to hold his cotton until he can make a profit on it. He will never again have to sell his cotton below the cost of production in order to pay off a part of his debts. And the experience of Mr. Alford is echoed by farmers all over Georgia, who have successfully turned to the dairy cow as a means of beating the boll weevil.

Georgia. J. H. REED.

Tuberculin Testing in Oregon

HOARD'S DAIRYMAN:—Federal, state, and county veterinarians in Oregon during the last two years tuberculin tested 336,637 cattle, the largest number in any state west of the Mississippi, at a cost for indemnity of only $16,824, the amount being matched by counties and duplicated by the federal government. Only 3,130, or less than one per cent, reacted, and the state is declared by the live stock sanitary board to be more nearly free from bovine tuberculosis than any other dairy section in the United States.

Under a law passed in 1925, practically all dairy animals west of the Cascades in Oregon have been tested annually during the past two years, but because of a Washington County decision that its test law was unconstitutional, it became necessary to have a law state-wide in application if the work were to continue, and such doubtless will be enacted by the present legislature. It will exempt only range beef cattle not in contact with dairy herds and feeder cattle under strict supervision.

Oregon. G. N. ANGELL.

Vigor of Corn Germination

Just now when thousands of corn planters are being oiled for the season's service the following item relative to the germination of floury (starchy) and horny corn is of interest. The item is taken from some work reported in Bulletin 284 by the Illinois Experiment Station:

Floury corn has been shown in actual experience to be less vigorous in germination than horny corn. An experiment was planned to determine why this is so.

A large number of floury and horny grains were placed on a germinator and a sample of each removed every two days for chemical analysis. The longest period for any one sample on the germinator was 10 days. The analyses showed that the starch in the horny corn disappeared more rapidly during the process of germination than did the starch in the floury corn. The horny starch seemed to be more easily changed from the insoluble to the soluble form. In sugar content the two types of corn showed no consistent differences. In dextrin and soluble starch content, however, there was a marked difference, the seedlings from the horny corn having distinctly higher contents of these two substances than the floury corn.

These facts lead to the inference that the superior vigor of horny seed is directly connected with the ease with which the starch reserve is broken down and made available for the young plant.

Moore Bros. "Purpul" Medicated Wax Teat Dilators

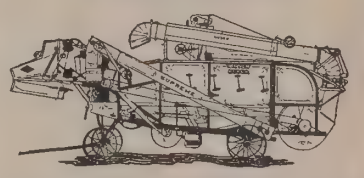
Thousands of cows are partially or totally reduced in value by neglect of minor teat troubles. Prevent this loss

Use "Purpul" Medicated Wax Teat Dilators

When to Use "Purpul" Medicated Wax Teat Dilators

After operating a cow's teats. When teat is sore on end or inside. Spiders in teats. After removing small scabs on end of teat. Hard milking teats. Never allow a sore teat to heal or gum shut.

"PURPUL" MEDICATED WAX TEAT DILATORS are sold by druggists and dealers catering to dairy interests or mailed direct, postpaid, one dozen 25c; five dozen $1.00.



MOORE BROS., Dept. H ALBANY, NEW YORK

Unusual Farming Opportunity!

We have acquired three large adjoining plantations 50 miles west of New Orleans which we are dividing into 40 and 80 acre farms to provide corn, Soy beans and alfalfa for our new stock food factory in the South. Several of these farms will be disposed of on favorable terms to those desiring to operate them. These crops are highly profitable with an excellent market. Dairy and poultry have shown splendid results. Prices $125 to $165 per acre. Farms will be delivered with crops growing and with buildings. Crops grow entire year. Climate mild in winter and with cool gulf breezes compares favorably with central states in summer. Health reports show Louisiana now ranks higher than many northern States. District has been well settled for many years. Excellent schools, splendid people, and is located between two thriving little Cities. Main line of Southern Pacific and an important highway passes thru property. Miles away from river. Floods unknown. For complete information address

PIONEER GRAIN CORPORATION, 720 Flour Exchange, Minneapolis, Minn.

What is the Ayrshire Herd Test? is a plan for finding the produc- on of every cow in the he of the eeders who are testing under the pervision of the Ayrshire Breeders' ssociation. (See page 135.)

How does it work? Monthly re- orts are made on a one-day test. ne tester handles a maximum of 20 imals. Most of the records are ade on just twice-a-day milking.

How many herds are being tested? uring the first year some fifty herds, cluding about 1,500 animals, have en tested under this plan.

How may electricity be used in the rm home? For lighting and for erating a water heater, a sewing achine, a washing machine, a cook ove or range, an iron, a curling on, a vacuum cleaner, a fan, a ra- o, a toaster, a radiant heater, a otor for the pump. (See "Elec- icity in the Farm Home.")

How does Mr. Hoogland market s potatoes? This Dutch farmer gs his crop in early June. The po- toes are loaded into his canal boat id taken a few miles away to the rmers' co-operative potato auction. See page 438.)

Where is the most Grimm alfalfa ed grown? Idaho grows from 80 90 per cent of the nation's pedi- eed Grimm alfalfa seed. More an 340 members of the Idaho rimm Alfalfa Seed Growers' Asso- ation operate farms within a 50- ile radius of Blackfoot in Bingham ounty. (See page 439.)

What causes bloating in cattle? ny kind of feed that causes indi- stion, but it is usually caused by al- lfa or other succulent forage eaten eedily, especially when wet. (See ge 458.)

Do You Know

where, how, why, when the 4-leaf clover became the emblem of 4-H Club work? O. H. Benson tells you—

IN THE NEXT ISSUE

Junior Letters

Hoard's Dairyman Juniors:—I belong to ee other clubs besides this one. I am lead- of a 4-H club where we take cooking, sew- , and baking. All of the girls like the rk. We hope to try a calf club in a year so. I am a farm girl 18 years old. I have ee sisters who are Hoard's Dairyman Jun- s. Drop me a line if you wish. My ad- ss is Westby, Wisconsin.

Merle Alderman.

Hoard's Dairyman Juniors:—I belong to 4-H Club. I have two Guernsey calves. st year I won first prize for improvement calf, first on record kept, and second on wmanship at our club show at the county r. There were 12 Guernsey, 31 Holstein, 1 5 Brown Swiss calves. I won a pure-bred rnsey bull calf and a heifer calf and $5 in zes. I have 4 Guernsey heifers and 1 l. My address is R. 2, Lone Rock, Iowa.

Ronald Christenson.

Hoard's Dairyman Juniors:—I am presi- t of our boy's club which is listed as the lden Potato Club, but we do all kinds of k along other lines. At the Rutland Fair year we won prizes for calves, sheep, s, hens, ducks, geese, and all kinds of m stock. We won prizes on our handi- ft products, our canning, and demonstra- n. You see we are not working along one only but on all things that a farm boy girl ought to know. We are also taking the study of forestry projects and the ing of fruit trees. At the fair last year team mate and I won second prize for demonstrations. We demonstrated on the making of permanent leaf prints and are planning to demonstrate on the proper handling of cattle this year. We are also studying how to prune and graft trees. My address is R. 1, Pittsford, Vermont.

George E. Hurd.

Hoard's Dairyman Juniors:—I am 12 years old. The place where I live is mostly scattered ranches. The occupation is stock raising. I have made several trips on the range with my brothers and sisters when they salt the cattle. There are lots of wild animals in Boulder. There are two men here trapping them now. Several years ago, a large bear roamed the ranges, (the Boulder and Escalante Mountains) called old "Bruno." He ate the stockmen's cattle. Many men were trying to catch him. Finally in 1916, Mr. Rueben Jolly and Mr. Chess Riddle, from Coyote, Utah, killed him on the Escalante mountain. They had to shoot him thirty times to kill him. He was very fat and weighed 1,400 lbs. I would like to hear from other Juniors. My address is Boulder, Utah.

Christella Hansen.

Hoard's Dairyman Juniors:—I joined the 4-H calf club on the 17th of June and started keeping a record on the first of July. My calf was one year and three months old on the 26th of January, 1927. Her name is May Alcartha Piebe. When judging day came at the Washington County Stock Show, she walked proudly among the others and when she saw what she had to compete with, she switched her tail, lifted her head, and walked slowly to the head of the class. She won first in the club class and first in the open class. I live near Haddam, Kansas.

Electa Young.

Hoard's Dairyman Juniors:—My father has a 30-acre farm. We have 10 cows, 1 bull, 1 horse, 2 or 3 cats, and 1 little dog, which we call Dynamite because he is so lively. I have a little calf which I like very well. My brother, Carl, and I have great times in the summer as friends come from the city to stay awhile. If any one wants to write to me, my address is R. 1, Steveston, B. C.

Helen Nelson.

Hoard's Dairyman Juniors:—We have a cow which has had six calves and she was just six years old the twenty seventh of last February. Five of the calves have been heifers. The third time she was fresh, she had twin heifers which made us feel very proud of her. We have a herd of registered Jerseys. I am in the Freshman class at high school and am thirteen years old. I read the Junior page every week and I think it is very instructive for men and women as well as boys and girls. I would like to hear from some of the Juniors. My address is R. F. D., 1, Box 44, Chandlersville, Ohio.

Charles Brookover.

Hoard's Dairyman Juniors:—I am a boy 10 years old. I have joined the poultry club. We have White Leghorns. We get about three dozen eggs from 100 hens. We have 14 head of cattle, 4 horses, 5 pigs, and 100 hens, also 7 head of turkeys. My birthday is November 7th and I will be very glad to hear from any of the Juniors. My address is R. 2, Mansfield, Texas.

Marion Morgan.

Hoard's Dairyman Juniors:—I belong to the calf club and I like to take care of a calf. I have a Holstein calf. This is the second year I've belonged to the calf club. There are many children in our school that belong to the Hoard's Dairyman Juniors' Club. My address is R. 1, Box 13, Fort Atkinson, Wisconsin.

Gerald Hevey.

Hoard's Dairyman Juniors:—I used to live in Hillsboro, Wisconsin. I moved to Missouri November 14, 1925. Now we have bought a 240-acre farm four miles southwest of Stover. We have a lovely farm. There are a great many fruit trees here such as Delicious apple, peach, plum, mulberry and cherry trees, and tame grape vines. We have fine buildings; a large house, barn, granary, and all other buildings which are needed on a farm. Our house consists of eight rooms, and two screened and one open porch. We also have a large lawn which is well shaded and has many flower beds, also cement sidewalks all around. My address is R. 1, Box 33, Stover, Missouri.

Irene E. Miller.

Hoard's Dairyman Juniors:—I wish to thank you for the watch fob, pin and creed. One Sunday the horses were out in the field and we went to get them. We took the bridles along. We rode the horses through the woods. My little brother hit my horse with a stone, and he began to go like the wind. I could not stop him. My brother yelled to pull his head to one side. I did and he stopped. He was a wildfire that day so I led him home. If you want to write, my address is R. 3, Burton Road, Grand Rapids, Mich.

Jack Van Dyke.

Hoard's Dairyman Juniors:—Dad gave me a heifer calf when I was sixteen and I am proud of her. We want to build up a herd of twenty cows. We are milking ten now. Last year was the first year we belonged to the testing association and we led six months straight and a couple more times through the year. We are now breeding to one of K. O. P. O. P.'s grandsons. The more we read about him the better we like him. We have discovered that we can make more money raising corn and filling the silos and milking cows, than raising spuds. My address is Mabton, Washington.

Vance Paul.

Hoard's Dairyman Juniors:—We now have 108 head of goats. It is fun to name the kids. We name them alphabetically. We know each kid by its name. We had sixty head last year to name and feed. We feed them as they come alphabetically. We have one goat that is noticed by everyone. His name is Jonah. When any one comes around, he runs and puts his nose in their hand. He likes to push as hard as you can. He will push with all his might. He is about a year old and very funny. If any one wishes to write to me my address is Compton, Arkansas.

Esther Bruce.

Hoard's Dairyman Juniors:—I am 10 years old. I like club work very much. I have a grade Guernsey calf. She took first at the Fargo Fair in her class. Her name is Dora. I am getting her ready for our county fair next June. I am feeding ground corn and speltz, mixed corn fodder, and wild hay. She gets all the water and salt she wants. My address is New Rockford, North Dakota.

Kenneth Anderson.

Cow Blankets

Cover your stock with "Burch's Best," the blanket endorsed by leading herd owners everywhere. Combine beauty, practicability and low price. Special patented design—fit perfectly.

"Burch's Best" *ARE* Best

Finest material—best made. Fully guaranteed not to rip or tear for two years. Write today for samples, prices and FREE descriptive booklet.

F. S. Burch Co., 152 A W. Huron St., Chicago

TOUGH FLAPS *Win* TOUGH CUSTOMERS

YOU can't please your customers with flimsy caps. They tear. Furnish your bottles with Certified Caps—the caps with the tough red fiber flaps. They are easy to see, easy to grasp. They lift the bottle cap easily every time. That's why they pay big profits. They win customers and keep them.

Certified Caps with Red Flaps are perfect for capping machines or for hand capping. And the cost is small. They will save you money and we can prove it. Write us, or ask your jobber for free samples.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Farm Shop Tools and Their Care

YOU fellows all know that if you are going to do any building, you must have tools. You know, too, that there are countless repair jobs on the farm that cannot be done properly without the right tools.

Tools with an edge should be kept sharp. Oscar Hebbe sharpening a hand axe.

What tools should you have, and how should you take care of them?

Suppose we asked you to make a list of not less than 30 tools that are useful on the dairy farm, what would you put down? Do you know the names of all the common tools you have in mind, and can you spell these names correctly? Try it and then compare your list with the lists we are going to give you.

Do you know what a ball pein hammer is? We put this question to eighteen farm boys recently and not one answered "Yes." It is probable that most of these boys had such a tool at home. It generally comes as a part of automobile equipment. Had we called this tool by another name, doubtless all would have been familiar with it. If you don't already know, you should after you finish reading this page.

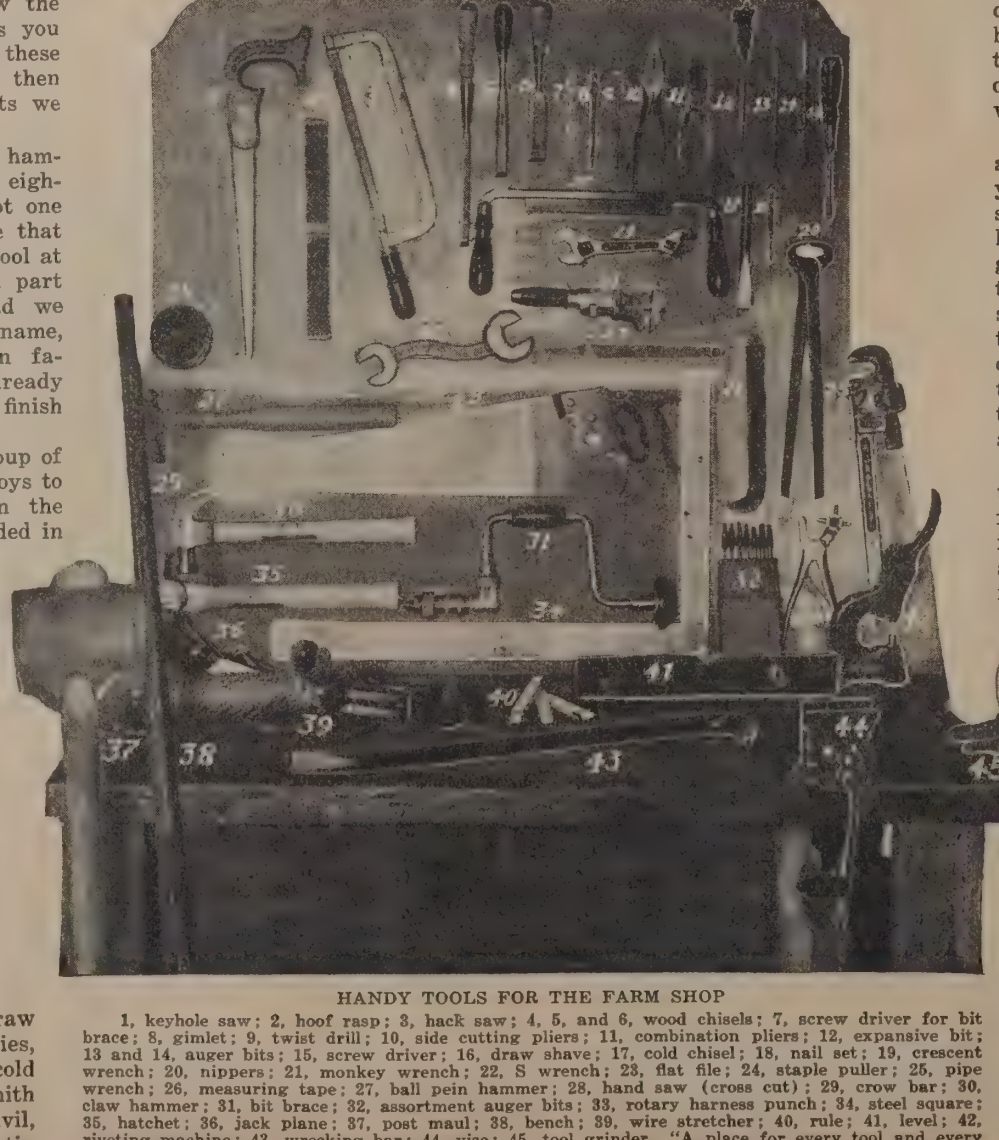
The other day we asked a group of farmers and a group of farm boys to make a list of useful tools on the farm. Fifty-one lists were handed in —24 from farmers and 27 from farm boys. No two lists were exactly alike. Altogether 110 different tools were mentioned. From this we compiled a list of the most popular tools which seems to us to give a pretty good cross section of handy tools both for the farm boy and for the farmer. Here it is:

Hand saw, claw hammer, monkey wrench, brace and bits, pipe wrench, vise, S wrenches, chisels, plane, screw drivers, square, harness punch, hack saw, axe, rip saw, pliers, pinch bar, wire stretcher, crow bar, files, level, hatchet, draw shave, set of drills, set of bolt dies, maul, punch, riveting outfit, cold chisel, splitting wedges, blacksmith hammer, open end wrenches, anvil, pipe reamer, pipe cutter, tin shears, socket wrenches, forge, soldering outfit, keyhole saw, rule, long handled shovel, hoof knife, calipers, wire cutter, miter box, set of pipe dies, hoof rasp, pick.

Your list might include some tools not mentioned here. You may live in a part of the country where a certain tool would be of great value, but others living elsewhere would have no use for it. An example of this is the soil auger. Where the character of the land is such as to make blasting necessary to clear the land for farming operations, the auger is used to insert the charges.

You very likely have a workshop of some kind on your farm. You may have a special building for that purpose, or perhaps you use the machine shed. At any rate, it is essential that you have some place to keep your tools and do your work. A shop where you can handily run in such farm machinery as may need working on is desirable.

To keep your tools looking bright, wipe them occasionally with a cloth dampened with a little machine oil.



In purchasing tools, it is well to bear in mind that the best is none too good. While you can get the tools we have listed here at a considerably lower cost, remember the cheap tool is often expensive in the long run. The following list was supplied us by a hardware merchant, and gives a good idea of what tools are useful on the dairy farm and about how much they cost.

1—2-oz. curved claw hammer	$ 1.50
1—No. 8 cross cut hand saw	3.00
1—Rip saw	2.00
1—Brace	2.25
1—Assortment of bits, one each 4, 6, 8, 10, 12 and 16-16ths"	4.50
1—Expansive bit ⅞" to 3"	2.25
1—Assortment twist drill bits for metal ¼", 5-16ths", and ⅜"	.75
1—Assortment ⅜" cold chisel, ⅝" cold chisel, 2—½"x6" machine punches, 1 double end screw driver, 1-5" screw driver, ⅛"x⅝" punch	2.75
2—Wood chisels ¼" to ¾"	1.50
1—15" jack plane	3.25
1—Steel square	1.25
1—Hand axe	1.75
1—Small level	.50
1—Handy farm vise	4.50
1—Tool grinder	2.50
1—Staple puller	.25
1—Pr. heavy pliers, side cutting	1.35
1—Wire stretcher and hoist	1.85
1—Wrecking bar	.40
1—Crow bar	1.75
1—Post maul	1.50
1—Axe	2.00
1—Monkey wrench	1.50
1—Pipe wrench	1.60
2—Adjustable crescent wrenches 6" & 8"	1.70
3—Harness punches at 25 cts. each	.75
1—Hack saw with 3 or 4 blades	.75
1—Hoof rasp	.35
2—Splitting wedges at 65 cts.	1.30
1—Riveting outfit	1.25
1—Keyhole saw	.35
1—Measuring tape	.75
1—Nippers	1.50
	$55.15

A workbench, a grindstone, and an assortment of nails, nuts, bolts, rivets, washers, screws, staples, and wire should be, and is, a part of standard equipment of every shop. A pair of saw horses is mighty handy.

How should your tools be k

(1) They should be kept dry,

HANDY TOOLS FOR THE FARM SHOP

1, keyhole saw; 2, hoof rasp; 3, hack saw; 4, 5, and 6, wood chisels; 7, screw driver for bit brace; 8, gimlet; 9, twist drill; 10, side cutting pliers; 11, combination pliers; 12, expansive bit; 13 and 14, auger bits; 15, screw driver; 16, draw shave; 17, cold chisel; 18, nail set; 19, crescent wrench; 20, nippers; 21, monkey wrench; 22, S wrench; 23, flat file; 24, staple puller; 25, pipe wrench; 26, measuring tape; 27, ball pein hammer; 28, hand saw (cross cut); 29, crow bar; 30, claw hammer; 31, bit brace; 32, assortment auger bits; 33, rotary harness punch; 34, steel square; 35, hatchet; 36, jack plane; 37, post maul; 38, bench; 39, wire stretcher; 40, rule; 41, level; 42, riveting machine; 43, wrecking bar; 44, vise; 45, tool grinder. "A place for every tool and every tool in its place." Why not hang them up on the wall with a silhouette showing the exact location of each tool?

To keep your tools bright wipe them t an oily rag. Perry Kruckenberg shows

(2) Tools w an edge, such as saws, wood an chisels, planes, and hatchets, s be kept sharp, first because tools are easier to work with, an ond because sharp tools do work.

If you don't know how to sh a blade, your dad can probably you. Surely you have turned a stone many times, but you know how to hold the blade o grindstone to make the proper ting edge. If you sharpen you saws, you will need a saw set. ting the Farm Saw" is the title excellent bulletin on this subject ten by L. M. Roehl and publish the New York College of Agric at Ithaca, N. Y.

"A place for every tool, and tool in its place." There's a for you, boys. It's mighty agg ing when you want a certain t a hurry, to have to hunt all ov farm for it. A simple plan, hang your tools to make a silhou each tool in its place. Then whe put a certain tool the silhouette tel just where it be To make a silh trace with a pen outline of the too hangs up, then take the tool and paint in the outline soli black paint or stove blacking

Early Use of Lime in Old England

GUY A. PETERSON, WISCONSIN

IMING the land is a practice that has been known in England for many generations. Its is so common that provisions made in leases for its application. en no provisions are made in the e the tenant can apply lime at leisure and the landlord must him for the unused portion in the tenant is forced to give up place. The tenant who desires to rove his production by the use of is protected by law, so he is h more willing to apply it than n American tenant who has no protection.

may be of interest to record an y instance of the use of lime in country. The following account been taken from a December, , issue of "A Collection of Letfor Improvement of Husbandry Trade," one of the earliest agriural weeklies known. This old r was a collection of letters sent every week to a subscription list e up of business men and farm- It was printed before the time ural free delivery, however, so listribution was much of a task. Houghton, a member of the l Society, was its editor and he ished letters pertaining to many s of agricultural and trade prob-

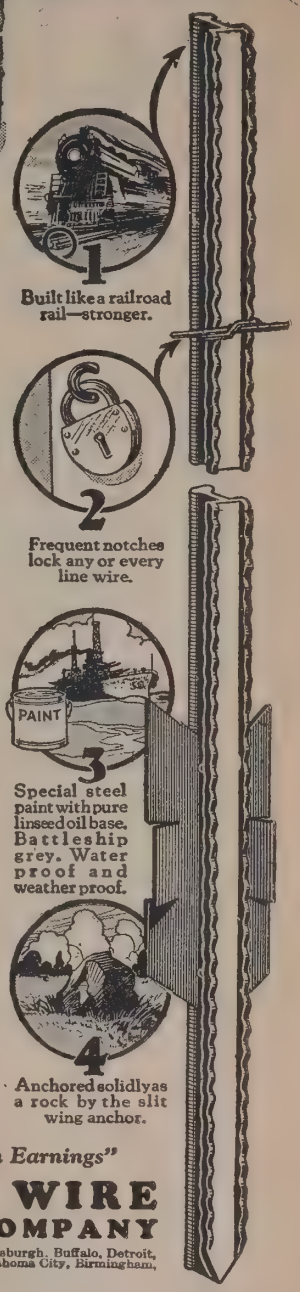
view of the fact that the "Coun- Gentleman," the oldest agricul- paper in America, was estabd only 94 years ago, it is worthy ote that Editor Houghton was ading the gospel of lime in Engtwo hundred and forty years The letter was written by A. indale, who says:

think it is not impertinent to business to tell you that in my on a mighty improvement might nade of mossy-ground in counthat abound with lime, above is ordinarily known. To conwhich, I shall relate to you a which an honest gentleman of ordshire some years since told and it was thus, so far as my ory is to be relied upon.

le having accidentally set on about ten acres of mossy-ground ch burned to the very sand) in common belonging to W., sent eams six or seven miles off (to all) for lime, which he mixed the ashes, and sowed the plat ound with rye, much against the on of his husbandmen whose tions and jeers he could not wise silence, but by a peremp- command to hold their peace bserve his order. And the issue was, that though he was constrained to make a costly fence about it, that crop of rye cleared all the charges of the fence, lime, feed, and husbandry, with advantage to his purse; and besides, turned a barren piece of moss into a good close of land. I suppose, that upon a moderate account, the close may well be worth, for pasture alone (besides the benefit of plowing it sometimes) five pounds per annum, or very near, whereas I cannot think it was worth a tenth part of the money before this accident fell out of firing it; for there is enough in our county to be taken as cheap as that comes to; and I myself would be glad of that rate for land which I judge much better, during my lease, for which I hold it with other ground that I have improved. Though I am apt to think, no county about us (if any in England), charges the farmers more deeply with rent, proportionably to the probable reports to be made of the land, than this of ours. I am sure many of our farmers do not only say so, but make it to appear they speak as they think, by removing themselves with their families and stocks into other counties; of which, of late years, we have too plentiful instances. What advantages then might be made of some great mosses in Lancashire and elsewhere that lie near to coal and limestone, and therefore might well be spared, without making fuel dear, and improved at very small charge, and for the present, yield little or no profit, save some grig, or heath for sheep, and young cattle to feed poorly upon; and this oft in peril of their lives; particularly, what abundance of this sort of ground lies within a few miles of Clitherow (the great staple for lime) which is good for little or nothing in its present condition, but to make the country thin of its inhabitants"

Eastern States Exposition Judges

Judges of dairy cattle for the 1927 Eastern States Exposition, Sept. 18—24, are announced as follows: Holsteins, W. S. Moscrip, Minnesota; Jerseys, G. C. White, Connecticut; Guernseys, John Clark, New York; Ayrshires, Lewis Seitz, Wisconsin; and Brown Swiss, John C. McNutt, New Hampshire.



This year for the first time since 1917 there will be classes for Brown Swiss cattle.

J. HOWIE'S CHAMPION AYRSHIRE FEMALE SHOWN AT 1927 LIVE STOCK SHOW, AYR, SCOTLAND

AMERICAN STEEL & WIRE COMPANY

Better Fence for Less Work

Here are the steel fence posts you will find pay you best in long service, with less work to set up. Note the big features which save work and help make better fences.

Banner Posts are not affected by frost. Your fence is grounded wherever a steel post is used and danger to your stock from lightning is greatly reduced. With Banner Posts the fence line can be burned off every year, thus getting rid of weeds, insects and rubbish. The clean farm grows the best and biggest crops and with the least labor and expense.

Banner Steel Fence Post GUARANTEE

All Banner Steel Fence Posts are made of railroad rail design with heavy backbone reinforcing. They are GUARANTEED *to give the equal of or longer service than any other steel fence post of same weight which is used under similar conditions. Any buyer who will show that Banner Posts, purchased through his dealer, have failed to give this service, will be supplied by us with new posts free of charge and without delay.*

Creosoting Fence Posts

hat is the best method of treating fence posts s to avoid rotting and decay?

ontrose, Pa. H. S. B.

ie first consideration is to properly cure the n timber. As soon as cut, see that all the is peeled off. If the bark is left on it pro- s quick decay as it offers an ideal breeding e for insects that injure the wood and it pro- s rotting. After removing the bark, pile the material on logs to keep it off the ground arrange the posts in the pile so there will be circulation around the posts until ready for

al tar creosote makes an excellent preven- The method of using it that is most practi- or farm use is to provide two barrels or vats. ne of these the coal tar creosote is heated to to 200 degrees F. or nearly the temperature oiling water, being careful to not allow the d to boil and so waste it by evaporation. The s are then put into the hot creosote and left 30 to 60 minutes, depending on the kind of l. Keep the creosote at as near 200 degrees s possible. While it may be desirable to im- e the entire post, it is ordinarily sufficient to it to only a half foot more than it is to stand ie ground.

mediately after hot treating the posts, they placed in the tank of cold creosote and al- d to remain for the same length of time as ig the hot bath. It is during the cold bath most of the absorption of creosote takes . As the hot post comes in contact with the creosote the heat is driven off and so forms tial vacuum within the cells of the wood that s in, as it were, the cold creosote to a greater n than would otherwise be the case.

hen removed from the cold bath, set the posts tank or trough that will catch the drippings ey may be used in replenishing the supply. both the hot and cold tanks filled to such s as will treat the posts to the proper depth. t for treating dry posts that have had all the removed, as otherwise the absorption of ote will be hindered. If posts 4 to 5 inches trong enough, it will be more economical to them than it will be when larger posts are In some cases it is recommended to allow osts to remain in the creosote for 6 to 12 s.

Silage Heats and Molds

ve a silo 12x32, made of concrete blocks, an air space in each block. Every year I trouble with my silage. It stays hot all the and never cools off. Molds about a foot from wall all around the silo. The silage looks n and has a queer smell. I cut my corn e it froze and it was in a good condition, t doesn't take long before it starts to heat. ou think the air space in the blocks takes the ure away from the corn and keeps it warm? e trouble lies in the construction of the silo, would you advise doing?

o Rivers, Wis. A. B.

do not know just what may cause your nt trouble with silage. If the spoilage occurs y around the outer edge, it is probably due e leakage of air, either through the cement or through the joints between the blocks. act that these blocks are hollow would have rticular effect.

he trouble is due to this cause, you can over- it by carefully going over all the joints and enenting them. Following this, we would go he entire interior of the silo with an applica- f cement mixed with water to a creamy con- cy. You can apply this with an ordinary wash brush or, possibly, a broom would an- the purpose if care is exercised to distribute of the cement wash over the entire portion e interior. Unless the blocks are very por- ne application should be sufficient, although y be necessary to repeat it in two or three This is just what we do to the interior of a n to make it water-tight and such an appli- also tends to make the silo air-tight.

ther possible cause of the silage heating and spoiling may be improper packing at the edge, either due to the fact that the silo is uly perpendicular or to the corn being too r not packing thorough enough at the outer

his trouble also appears in the interior part silage, it is possibly either due to the corn being too dry or, more likely, the fact that care is not exercised in removing the silage for each feeding. If the top of the silage is broken up and loosened below the depth at which each feeding is taken off, it permits air to enter and frequently the silage will commence to re-heat. This can be avoided by being careful to loosen up only what silage is removed each day for feeding.

Sterilizing Dairy Utensils

In our issue of January 10th we replied to an inquiry concerning the use of sodium hypochlorite for sterilization of milk utensils. Our reply to that question has been misconstrued to the effect that just before use it would be desirable to re-rinse the utensil with clear water. This was not the thought we sought to convey, but rather that it be re-rinsed with the sodium hypochlorite solution to make insurance doubly sure.

Concerning other questions raised by our correspondent, Professor H. H. Sommer, dairy chemist at the Wisconsin College of Agriculture, has given us the following reply:

"That a small amount of sodium hypochlorite does not cause a noticeable flavor in milk is correct. This is, undoubtedly, due to the fact that the available chlorine is rapidly removed by chemical combination with the organic matter of the milk. In a similar manner the statement that sodium hypochlorite is not a preservative is also correct.

"The effects of sodium hypochlorite as a germicide and antiseptic is dependent upon the available chlorine content. When added to milk the available chlorine of the sodium hypochlorite rapidly disappears so that, under such conditions, it would have little or no effect.

"Sodium hypochlorite used for sterilizing utensils will improve the keeping quality of the milk placed in these utensils—not because the trace of sodium hypochlorite acts as a preservative, but because the hypochlorite has sterilized the utensils and has thus eliminated the heavy contamination milk usually suffers on contact with unsterilized utensils.

"In using sodium hypochlorite it is preferable to rinse the utensil, invert it, and allow it to drain and dry slowly. It is not as desirable to follow this rinsing with a water rinse, nor is it as desirable to dry the utensil quickly over a stove or heater. This is true because sodium hypochlorite does not act instantaneously. If the solution is allowed to remain on the inside of the utensil—as it did in the preferred practice—the action of the sodium hypochlorite will be more prolonged.

"If the utensil is rinsed with water, there is not only the chance for re-contamination with a poor water supply, but also sodium hypochlorite may be removed too promptly, before the can is actually sterilized. If the can is promptly dried after the sodium hypochlorite rinse, the action of the sodium hypochlorite is reduced in effectiveness, because it is not effective in a dry form and, furthermore, undergoes decomposition on drying.

"It is, undoubtedly, true that sodium hypochlorite is a better solvent for the film of milk that may adhere to the utensil than is calcium hypochlorite."

Sampling and Testing Cream

In one of the issues of Hoard's Dairyman I saw an article published on the testing of cream, in which you stated that if the cream was in the can it was almost impossible for two men to get the same test of cream.

Will you please tell me how the creameries take their samples when the cream is not delivered every day? Is there any information on the variation in the test of cream by using a pipette? This method, of course, is not accurate but I would like to have some idea of the variation in the test by using this method.

Pipersville, Pa. G. E. L.

We believe our inquirer refers to an inquiry concerning the testing of very sour cream and cream that was frozen. In these cases it is frequently difficult to get a representative sample. It would be inaccurate to say that it is almost impossible for two men to get the same test from the same can of cream. With reasonable care in taking the sample the two tests should not be far apart.

To get the viewpoint of a man well informed on testing cream, this inquiry was referred to W. A. Cordes, who replies as follows:

"It is possible by complete and thorough stirring of the cream in the can to get it into a uniform condition permitting sampling for testing. A sample taken from a thoroughly stirred can will be representative. It is sometimes necessary, on account of the condition of the cream, to stir rather excessively, but in general, stirring about 15 times in a rotary motion from the top to the bottom of the can is sufficient to put the cream in satisfactory condition for sampling. With frozen cream and cream that is solid, because of hard fat, the handling of the cream is greatly facilitated without injury to the cream by holding the cans in water at 90 degrees for thawing or softening. Occasionally a can of cream containing exceptionally high melting point fat is received which must be exposed to a temperature somewhat higher for proper softening. Thorough stirring will then put such cans in satisfactory condition for sampling.

"The pipette is inaccurate in measuring the sample for fat test because of variations in the condition of the cream. In some experimental work on different methods of testing cream for butterfat, we found that in some instances where very thick cream was being tested, we would secure more than 5 per cent difference in test when measuring with a pipette as compared to weighing 9 grams. The pipette used on such cream will not deliver the correct amount into the test bottle. Also, differences in fat content mean differences in density of the cream which the pipette is unable to take care of."

Clover for Silage—Stack Silage

I have in mind putting green clover in the silo. Can you give me advice whether it is a paying proposition? Will clover in a stack put up green keep like they put up pea vines in a stack or will it heat and mold?

Bloomer, Wis. A. K.

Under normal conditions, corn is the ideal crop for silage purposes, both in yield and in the superior quality of the resulting silage. However, if corn cannot be relied upon to make a good crop, it will be found advantageous to use something else.

In some states, particularly in the dry sections, some one of the grain sorghums will be used. On the western coast, large use is made of barley, wheat, and oats. In most cases, there is seeded with the grain either vetch, peas, or some other similar legume crop that is best adapted to the locality. In the northern sections, the most usual substitute silage crops are peas and oats, or sunflowers.

Under most conditions, we would advise the curing of clover or other legumes as hay rather than attempting to make silage of them. If it is not possible to have some other practical succulent feed, such as roots, or some other silage crop, then it might prove desirable to ensile clover.

As alfalfa, clover, and other legumes contain a much higher percentage of water than does corn, it is desirable that these crops be cut when they are somewhat more mature. If cut when at the usual time for hay, it is advisable to allow the crop to lie in the swath for five or six hours in order to allow some of the water to evaporate. Just how long it is to lie in the swath will depend upon the kind of drying weather that prevails. The thought is to have not over 60 lbs. of water to 100 lbs. of green material at the time the crop goes into the silo. If the clover contains too much moisture, the resulting silage will be slimy and ill-smelling. If conditions are right, the clover silage will come out in good condition and make a fairly satisfactory substitute for corn silage, but probably will not be equal to it. Decision as between corn and clover will depend quite largely upon the relative yield of these two crops per acre in the given section.

A farmer in Langlade County, Wisconsin, finds timothy and clover will yield a higher tonnage per acre on his farm than will corn, except in certain years when corn makes an unusual crop. He secures a high grade of silage. It is probably superior to clover alone as the addition of the timothy makes the combined silage more nearly approximate the composition of the corn plant and the silage may have less odor.

Stack silage can be made of clover, corn, or almost any of the grain crops. There will be considerable spoilage just as there is when pea vines are stacked. Also, it does not make a convenient method of taking out the silage for winter feeding. It would be much better to build a trench silo if it does not seem practical to build a regular up-right silo.

Two men were walking down the main street of a country town when one of them took off his hat and bowed respectfully to an old gentleman who was passing.

"I owe more to that man than to anyone else on earth," he said.

"Did he give you your first chance in life?"

"No, he's my landlord."—London Tit Bits.

Report of Annual Guernsey Meeting

Guernsey breeders chose the Hotel Pennsylvania, New York City, for the 1927 meeting. Attendance and interest were both at a high point because it marked the passing of the fiftieth milestone and also a gathering center for those taking the trip to Guernsey.

About one-third of the total membership was present or represented by proxy. This information may stimulate breeders scattered far and wide to send their proxies to the club officers or executive committee next year.

All of the present club officials were re-elected for the ensuing year, namely, Robert Scoville, president; Wm. H. Caldwell and Gage E. Tarbell, vice-presidents; Karl B. Musser, secretary-treasurer. Four places on the executive committee were up for election and the men chosen were W. W. Marsh, Iowa; R. M. Cooper, Jr., South Carolina; A. L. Gile, Washington; and Dr. W. A. Munn, Wisconsin. The latter was the only new member elected.

The reports of Secretary and Treasurer Karl B. Musser were mighty interesting and indicated the coveted condition of increased business, strong financial status, and a prosperous future.

Wisconsin is the leading Guernsey state when number of cattle, club members, and registrations are considered. During the past year 7,376 Wisconsin Guernseys were recorded. Pennsylvania was second with 3,949 and New York third with 3,674. The Badger State also leads in the purchase of animals with Pennsylvania and New York following in order given. During the last year 3,225 more animals were registered than during the year previous.

That the breed is increasing in popular interest is seen in the list of 2,481 new breeders, which is a gain of 207 over last year. Furthermore, 202 Guernseys were exported to buyers in foreign countries. Increased interest is seen in testing Guernseys for the Advanced Register, as the present number of 2,234 cows on test has been exceeded in only two previous years, and is an increase of 4.3% over the number for last year. The average of all of the 2,038 Advanced Register records approved during the year was 10,328 pounds milk containing 517.5 pounds fat. The resultant increase in the breed average production to date is 59.7 pounds milk and 3.2 pounds fat.

President Scoville presided at the banquet held the night before the meeting. He ably pictured the growth and development of Guernseys under the fifty-year guidance of the American Guernsey Cattle Club. Speeches were made at the banquet by Dr. J. R. Mohler, Bureau of Animal Industry; Dr. C. W. Larson, Bureau of Dairy Industry; Geo. C. White, American Dairy Science Association; and C. L. Hill, M. D. Munn, L. W. Morley, C. T. Conklin, and G. E. Tarbell. Deserved praise for the Guernsey cow flowed freely and this, of course, caused all present to lend a very attentive ear to an interesting and worthwhile program.

Guernseydom is carefully watching the movement that has been discussed a good deal during recent years, namely, the passing of a federal law prohibiting the marketing of any milk except pasteurized or certified. S. M. Shoemaker addressed the assembled members on this matter and considerable interest was evidenced. Popular opinion was not in accord with the idea.

Notes on National Guernsey Meeting

There are a trifle over 1,425 members in the American Guernsey Cattle Club.

Twenty-four states sold more females during the past year than in the year previous.

Twenty-two states purchased more females this last year than during the previous year.

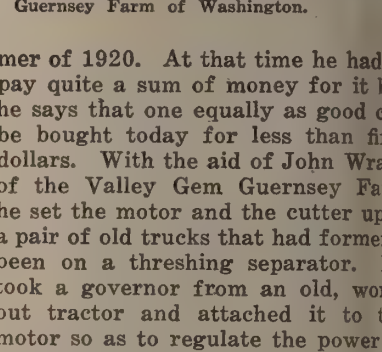
Two hundred fifty Guernseys were imported during the past year and 202 were exported.

Seven states have more than 100 cows on test. New York is the highest with 308.

Thirty-two per cent of the breeders are using the triple letter division.

Among the guests of honor at the 50th anniversary banquet was Miss Arvilla Boese, National Calf Club Champion.

Guernsey breeders will have cause to canvass their membership for a successor to President Scoville next year if his present intentions are carried out.



ST. AUSTELL DAFFODIL

St. Austell Daffodil is one of the good producing Guernseys owned by Ward Acres, New York. She recently completed a Class A record of 20,491.1 lbs. milk containing 935 lbs. butterfat. In addition to this record she has four other records,—479.4 lbs. fat in Class GG; 607.3 lbs. fat in Class B; 624.5 lbs. fat in Class A; and 876.5 lbs. fat in Class A.

Motor Runs Silage Cutte

HOARD'S DAIRYMAN:—R. B. Sch man of Washington solved the pr lem of lining up a silage cutter to power pulley by attaching the cut directly to the motor and doing av with both belts and pulleys. He run this outfit for six seasons in annual autumn job of filling a r of his neighbors' silos, and both and his neighbors find it very sa factory.

Schloman purchased the mo from a wrecking company in the su

R. B. Schloman's silage cutter choppin up some winter feed for the Valley Ge Guernsey Farm of Washington.

mer of 1920. At that time he had pay quite a sum of money for it he says that one equally as good c be bought today for less than fi dollars. With the aid of John Wra of the Valley Gem Guernsey Fa he set the motor and the cutter up a pair of old trucks that had forme been on a threshing separator. took a governor from an old, wo out tractor and attached it to motor so as to regulate the power the same way as a stationary eng takes care of the load whenever comes. This gives him the rig amount of power without excess use of fuel.

Schloman has a tractor but he sa it is hard to put it on the roads cause of the state regulations quiring that the lugs be removed fore the machine is driven over ma highways. Then, too, it gives tractor a lot of "no-pay" haul when one travels with it from fa to farm at silo filling time. What more, it would be difficult for a tr tor to climb some of the hills t Schloman has to climb in order reach all the farms where he cuts ensilage each year.

With his outfit, lined up a mounted on trucks as it is, howev Schloman can drive up to a silo, le the machine, put up the spouts, a be cutting silage again inside of h an hour. All he has to do when moves the cutter from farm to fa is to hitch a team of horses to trucks and drive. He says this ma chine solved the "refill" proposit because it is so easy to reset.

After watching the machine w last fall it seemed to me that it a good many points in its fav Any farmer who is mechanically clined and who knows a worth wh engine buy when he sees it, can fix an outfit such as this that will mat ially aid in keeping down tractor pair bills at the same time as it fords a cheap and reliable source power. Schloman does not use motor for any other purpose than ing silos because he has his trac but there is no reason why it co not be put to other work on the fa where stationary power is needed

Wisconsin. GUY A. PETERSON

A celebrated singer was in a mo car accident one day. A paper, a recording the accident, added, "W are happy to state that he was a to appear the following evening four pieces."—Epworth Herald.

Milk Producers Who Care

THOS. H. WITTKORN, PENNSYLVANIA

WHEN twenty thousand and a few more organized dairymen decide to improve the quality of their milk something just naturally happens. In this case it has resulted in giving Philadelphia a supply unequalled by any other city of its size and setting an example, which is pointed to all over the world, as to what can be done for one of our most valuable foods.

Ever since men have elected to live in cities they have tried all manner of means to safeguard their milk supply but never before have producers and distributors worked so much hand in hand to help them, as they are doing today in the Quaker City territory. Each of these three factors have come to realize their dependence upon one another and have put aside their old fighting spirit.

Back in 1916 to combat the warfare increases in milk production forces, dairymen for their own protection formed the Inter-state Milk Producers' Association, with a membership of about 4,000. At the end of a year this number had grown to 11:20 divided among 279 local units throughout the so-called Philadelphia milk shed which embraces an area of 150 to 250 miles radius of the city.

At the annual meeting of the association in December, 1923, drastic rules and regulations were adopted for the production and handling of the product—fluid milk. This would have meant nothing if the "Dairy Council," kind of a spoke of the main wheel, had not been given police powers, by the same meeting to enforce these self imposed laws. The membership was given full notice of the regulations and allowed until June 1 to comply with the high standards set.

Some of the most important requirements were: the cows must be clean, stabled, and bedded in light, airy, whitewashed, and regularly cleaned and drained stables; the milking must be done with clean hands or a properly sterilized mechanical milker; the milk must be promptly and properly cooled in covered milk houses and all equipment must be sterilized before using.

Upon the dealers was placed the responsibility of sterilizing and returning dry and clean all of the shippers' cans brought to them with milk. As a machine to do this work costs about $3,000 it has meant a heavy investment for the dealers. Many of them had to spend $50,000 to meet the regulations in all his receiving stations but it has resulted in a marked improvement in the quality of the milk sent to the consumers of the city.

As nearly all the dealers in the Philadelphia milk shed are members of the Dairy Council, they agreed to co-operate in adopting a set of regulations looking to the improvement of their milk handling methods. They also agreed to refuse to buy from farmers who did not meet the mark set for them by the association.

It was left to the quality control department of the Council to organize a force of fieldmen to check all the farms and receiving stations. It did not select a bunch of high-hat inspectors but picked farm bred, college trained men who know not only what should be done but had enough sense to realize what could be done in a certain time. Working in a group they covered the whole territory.

Remembering that these inspectors had no legal authority for what they were doing, one must admit a high type of co-operation when they were allowed the full freedom of private premises, even in many cases the farm kitchens, to check up standards of cleanliness. They made 25,000 inspections the first year, visiting many places more than once, and issued to farmers 16,934 temporary and 4,865 permanent permits to ship milk.

During this same time approximately 250 farmers were denied the privilege of shipping milk to co-operating dealers. In most cases the loss of a market was sufficient to bring a compliance with the regulations but some stickers for "personal liberty" could only ease their minds by selling their cows.

One of the greatest obstacles to the obtaining of a permanent permit, which means that all requirements have been met, was the lack of a satisfactory house for cooling and storing milk on the farms. The small concrete block building shown in the photograph is the kind recommended by the association and thousands of them have been built during the past two years.

Since all of the territory has been gone over at least once, it is now divided into nine districts with a resident inspector in each. It is possible in this way within a few hours to reach any point where trouble might arise. The men aim to inspect every place twice a year and some of the careless ones more often.

Fourteen automobiles, like the one shown, are used in the inspection service. Each man carries with him a card index record of all the members in his district and makes careful notation of his findings. Even after a permanent permit has been issued it may be, and in a few cases has been, taken away from the dairyman if he is not living up to the requirements.

Milk from the individual farms is tested for butterfat, sediment, and bacteria by the Council's inspectors at the shipping stations. If it is found below the standard in any of these things a warning letter is sent to the producer with suggestions for correcting the difficulty. In most cases this is all that is necessary but if it fails again the man is visited and frankly told he will lose his market if he cannot bring his milk up to the mark.

The fact that consumers appreciate all that has been done for them is shown by the increasing sales volume, more than is accountable to an increase of population. A better proof was the recent advance of one cent a quart in the retail price without a word of protest from the newspapers although it was announced that the increase was to go into the farmers' pockets.

ONE OF THE NINE INSPECTORS OF THE INTER-STATE MILK PRODUCERS' ASSOCIATION CALLING ON ONE OF THE 20,000 MEMBERS OF THE ASSOCIATION TO CHECK UP ON THE METHODS HE USES
Note the new concrete block milk house of which thousands have been built recently.

Calves Thrive on Skimmilk if Properly Supplemented

Under most conditions in Colorado the price of butterfat makes many dairymen hesitate to feed whole milk to their calves.

Whole milk is nature's food for the calf, but skimmilk, properly supplemented, will, in the light of many experiments, make a feed equally as good. Whole milk may make a better calf than skimmilk, but not necessarily a better cow. Skimmilk is the whole milk after the fat has been removed by the farm separator. It must be supplemented with feeds which are high in energy-giving nutrients called carbohydrates and fat. Such supplements are corn meal, kafir meal, ground barley, and like feeds. The following ration is one suggested in the feeding of skimmilk to calves: ground oats, 1 part; ground barley, 1 part; wheat bran, 1 part; skimmilk and hay.

Corn meal or kafir meal may be substituted for the ground barley in the above grain mixture. —Extension Bulletin 236A, Colorado Agricultural College.

This Machine and One Man Puts Up The Hay

Sandwich Easyway Loader

Farmers call this *Easyway* the "One Man Hay Loader," for they tell us one man can make a big, full load. In this *Easyway*, inventive genius has made a loader that combines the *Cylinder* and *Push Bar* actions. This is one of the many exclusive features found only in the *Sandwich Easyway Loader.*

You've never seen a machine like it. The *Easyway* cuts down labor cost and farm machinery costs too.

The Cylinder gently lifts the hay from swath or windrow without change or adjustment. Steady work—no scattering—no broken clover or alfalfa heads. You get *all* the hay, better hay, and *all* the feeding value.

The Push Bars force the hay up and push it far onto the load. Thus less help and labor are required where this combined loader—two machines in one—is used.

Ideal Loader for Alfalfa and Clover. Solid Deck. We fit the *Easyway*, when wanted, with a solid deck which prevents the alfalfa and clover heads and leaves from being wasted by falling down through a slatted deck to the ground.

These other extra features of the *Sandwich Easyway Loader* mean much to you,—Adjustable Wagon Hitch, Flexible Tongue, Light Draft, works on even or rough ground, handles swath or windrow, does not dig up the ground, durable and lasting, works fine on alfalfa. There are over seventy years of manufacturing skill behind it.

Write to us and say, "I want full information on *Easyway Hay Loaders.*" We'll send you our interesting book FREE. Or go to your dealers; see this great machine. You'll never see another like it.

Stocks carried at Milwaukee, Madison, Eau Claire, Wis., Freeport and Jacksonville, Ill., Owatonna, Minn., Cedar Rapids and Council Bluffs, Ia.

Easyway SANDWICH Hay Loader

SANDWICH MANUFACTURING COMPANY, Sandwich, Ill., U.S.A.

Kills 'em dead

Improved Dairyman's "FLY-KIL"

is used by progressive dairymen everywhere. It is the only fly spray guaranteed to protect cows all day against fly annoyance. It's safe, sweet smelling, won't burn the hide or taint milk. It pays back in larger cream checks more than it costs.

Household "Fly-Kil"

is a deadly fly killer for spraying in the house. Sold at half the price usually charged for residence fly sprays. Use it and your home will be freed from insects.

Your Big Chance

to sell both kinds of "Fly-Kil." No capital required. If you can work full time this summer selling direct to the users write at once. Give age and name of your banker or other reference.

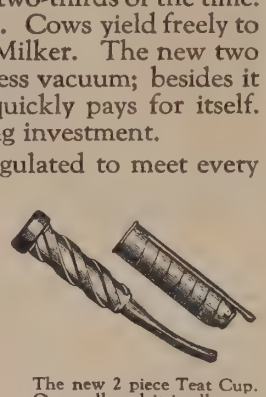
How The Perfection Pays For Itself

MANY satisfied users say that the Perfection saves the wages of one hired man. Others tell us it raises their milk production. Still others say that with no more labor they now keep larger and better paying herds.



On one thing they are all agreed, that **Perfection pays for itself.**

The Perfection Milker not only does away with all the drudgery of hand milking but it saves from one-half to two-thirds of the time. Besides the saving in labor you get more milk. Cows yield freely to the uniform natural action of the Perfection Milker. The new two piece teat cup milks cleaner, faster and with less vacuum; besides it is easy to wash. By all this the Perfection quickly pays for itself. On a dairy farm it is a modern, money-making investment.

The Perfection Milker can be instantly regulated to meet every changing condition as lactation advances. It cuts the dry, unproductive period to a minimum.

Every year you more than pay for a Perfection Milker—first in wasted labor and wages, again in lost milk production. Why milk by hand?

Send today for your copy of free catalog. Perfection milking pays.

The new 2 piece Teat Cup. One pull and it is all apart for quick and easy cleaning.

Profits Increased

HOARD'S DAIRYMAN:—Not long ago I heard someone say that cow testing is good only for making the farmer buy higher priced feed. To disprove this I offer as evidence the record for the Endeavor, Wisconsin, Association for the first and last month of its association year. In order to avoid any criticism I give in the following table the production and feed consumption for the same number of cows for both months, have credited the same price for fat, and charged the same prices for feed:

	First month	Last month	Increase	Decrease
Ave. test, %	3.42	3.68	0.16	
Total fat, lbs.	8760	9898	1138	
Value	$ 4380	$ 4949	$ 569	
Lbs. roughage consumed				
Silage	367350	281843		85513
Alfalfa	42858	48704	5846	
Clover	51181	76335	25154	
Timothy	46190	68811	22621	
Cornstalks	68510	18249		50261
Soy beans	4693	2846		1847
Marsh hay	13330	6182		7148
Total dry roughage	226762	221127		5635
Lbs. grain consumed				
Corn	32457	13675		18782
Oats	41912	23835		18077
Bran	7146	18352	11206	
Cottonseed meal	3540	11038	7498	
Linseed meal	4000	4586	586	
Dairy feed	3209	8990	5781	
Rye	2455			2455
Barley	2309	4744	2435	
Oat feed	3782	515		3267
Total grain	100810	87735		15075
Cost of roughage	$ 1918	$ 1973	$ 55	
Cost of grain	$ 1271	$ 1221		$ 50
Total feed cost	$ 3189	$ 3194	$ 5	
Profit	1191	1755	564	

During the last month better dry roughage and a better grain ration were supplied. Despite this the to cost of feed was only five doll greater, while the better feed creased production by 1,138 lbs. f This indicates that much corn a oats were wasted when the unb anced grain ration was used the fi month.

The members of the Endeavor sociation made $564 more above f cost the last month than they did first month. This increased pr was mainly due, if not entirely, better feeding. It shows there is danger of losing money by buy high protein concentrates if they needed to give the cows the feed t require for their best production.

Testing pays and is a good inv ment. W. BODECKER, Teste

Write the C. T. A. Edito Hoard's Dairyman, for our pri offer to testers for monthly a annual reports

Can You Make Money?

HOARD'S DAIRYMAN:—That depe upon the kind of cows you are f ing. There never was a cent m feeding poor cows and good cows not show a good profit without fee

The other day in making a test one of the members of the Long P rie C. T. A. we found that he feeding high priced concentr from the local mill costing 1.68 pound and alfalfa hay $24 out of car. A good many inexperienced rymen in reading this will say, " possible. No cow in the world pay for it." Maybe not, but here the facts. He was feeding 50 lbs. lage, 8 lbs. alfalfa hay, and 11.4

The Super Tire

For Super-Service and Super-Mileage

The outstanding achievement of tire-craft, the Fisk Extra Heavy Balloon, opens the way to extra comfort, extra safety, extra mileage for the motorist.

Built of *"Fillerless"* Cord, by a patented process, the Fisk Extra Heavy Balloon surpasses all others for smooth riding, sure traction, safe, steady breaking and steering, throughout many more tire-miles than you expect.

The Fisk Balloon line consists of the Fisk Balloon, the Fisk Premier Balloon, the Fisk Extra Heavy Balloon.

There is a Fisk Tube for every tire, a standard gray and circle made extra heavy red. To get the most out of your tires, use Fisk Tubes.

"FISK SAYS IT WITH MILEAGE"

FISK
EXTRA HEAVY
BALLOON

grain. To some it will seem like extravagant feeding, and maybe it is.

Most of the cows in this herd were fresh in October and November, one in September, and the other in July. During February these fifteen cows produced 16,499 lbs. of 3.14% milk, making 518.7 lbs. fat. At the local creamery price of 59c a pound this fat was worth $305.97. The total feed cost for the fifteen cows milking and one dry was $168.55, leaving a profit above cost of feed of $137.42. The average cost of producing a pound of fat was 32.4c, leaving an average profit of 26.6c above cost of feed on each pound of fat produced.

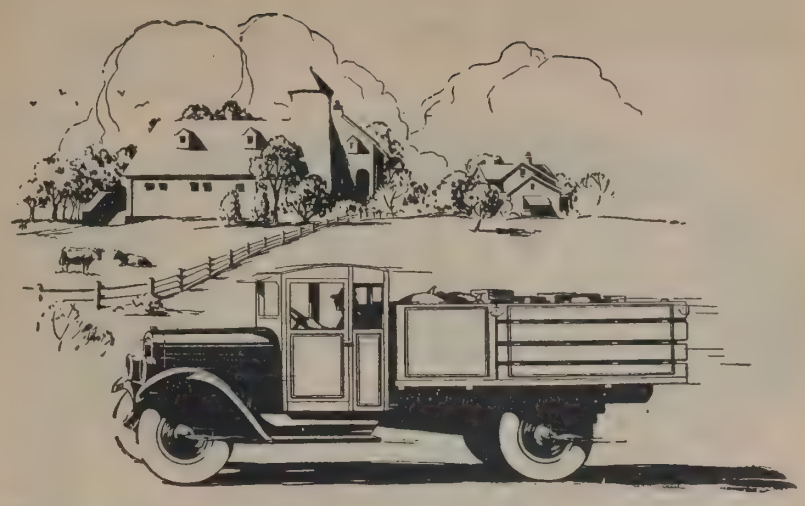
A chain is as strong as its weakest link. Good cows, good feed, and a good man spell success in the dairy business. One without the other spells failure. Let the C. T. A. records help you on. BERNERD J. ROSENQUIST, Tester.

Culling and Better Feeding

HOARD'S DAIRYMAN:—An illustration of what a cow testing association can do for an intelligent farmer is shown in the monthly summary of the results secured by a member of the Hammond—Baldwin Association of Wisconsin. He joined this association in November, 1925.

For February, 1926, this herd of 18 cows, 17 of which were milked, produced a total of 457 pounds fat which at 50 cents was valued at $228.65. The total cost of feed was $142.56, leaving a profit over feed of $86.09.

In February, 1927, this herd consisted of 19 cows, 17 of which were again milking. They produced 534 lbs. of fat which at 50 cents a pound was valued at $266.90. The total cost of feed was $149.27, leaving a profit over feed of $117.63 or an increase of income over feed cost for the entire herd of $31.54.



The average profit for all cows in the herd including those dry was $4.78 in February, 1926, and $6.19 in February, 1927. This increase of $1.41 more profit per cow for the shortest month in the year was due to the culling of poor producers and better feeding. During the intervening year 7 undesirable cows were sold and these replaced by 5 cows purchased and three heifers raised. The cows were fed a more liberal and better balanced grain ration consisting of oats, wheat feed, corn, oil meal and cottonseed meal. The roughage in both cases was practically the same, consisting of corn silage and mixed clover and timothy hay. The same prices were used both years in figuring the value of the butterfat and cost of feed.

I charged $12.00 a ton for hay, $4.00 for silage, oats and barley at $28.00, wheat feed at $30.00, corn at $32.00, oil meal at $48.00, and cottonseed meal at $33.00. The increased profit came in spite of the fact that there were two dry cows figured in the average for 1927 as against only one in 1926.

OSCAR BERKSETH, Tester.

Michigan Prize Winners

Michigan conducts an essay contest for testers, six prizes of from $10 to $25 being offered by the Michigan Creamery Owners' and Managers' Association, and three medals by the Blue Valley Creamery Company. The prize winners were as follows: 1st, Casper Bloomer of Macomb No. 2; 2nd, Forrest Bender of Kent County South; 3rd, Walter Kirkpatrick of Leelanau County; 4th, Glen Bedell of Ottawa—Allendale; 5th, Lyle Anderson of Osceloa—Reed City; and 6th, Clarence Prentice of Newaygo South.

Long Time Service For Lower Costs

When you buy a truck you buy present and future service. The extent of that service depends upon the stamina stored away in proper design and husky construction.

On this basis—the 6-cylinder Speed Wagon is the lowest priced unit for every farm.

Speed Wagon's oversize strength in every vital part means that it will be performing its duties staunchly and alertly long after the ordinary truck has wearied of life and passed into the discard. It has been proved time and again that Speed Wagons will out-live and out-work cheaper, smaller trucks—and cost less in doing it.

In bringing farm production costs to their lowest level, it is the part of wisdom to investigate Speed Wagon essentials. Your Reo dealer will gladly give you the facts.

HOARD'S DAIRYMAN FORT ATKINSON, WISCONSIN

A Baby Milk Dairyman

F. C. MINNICH, OHIO

AND I'm going to stay right here till I go for good," was the final and significant remark of Elry S. Leasure, who runs a special baby milk dairy near Zanesville, Ohio. That is, he is where he wants to be. He's running a baby milk dairy in a good location, is giving hogs and chickens a chance to prove themselves profitable, and doesn't intend to make another move so long as he lives.

Time was, though, when Mr. Leasure was like some of the rest of us. He didn't know just what he wanted to be.

Twenty-eight years ago when his children were small, and school was distant, and farming was not very promising, he decided to take a course in undertaking for which he moved into town. For five years he kept up a round of getting out day or night in his business as an undertaker. Being of a sympathetic disposition by nature, he was especially popular among his customers. "But," he said, "it took all a fellow could make to keep up appearances and then I didn't like having to go dressed up all the time."

So he withdrew from the firm and started a small milk business in the basement of his city home. In this other two at a profit, after havi improved the buildings and increas the soil fertility by the use of c manure.

While her husband was expe menting with farms, Mrs. Leas went on with the basement dai and let me say there was nothing didn't manage well, from handli milk cans to keeping books. L most business women she uses head to mighty good advantage.

Finally Mr. Leasure saw that way to get what he wanted was build everything himself from ground up. And that is just ab what he has done or is doing. went four miles out of town on improved road and bought one h dred and sixty acres of well laid l with old buildings on it. He put this present modern dairy structu which is clean and sunny and pre enough for humans to live in. fact Mr. Leasure does live in corner of his big milk room at pr ent, but he doesn't expect to k that up long. He has moved his house over to a new foundation is remodeling it at the present ti It will have every convenience p sible to a city home, except which, unfortunately, is not to had there. Then he will move

THE BACK DOOR OF THE LEASURE BARN

the only appearances he had to keep up were those of his one milk wagon and his good quality milk. He started out with the idea of giving his customers the best milk he could get. Every morning farmers delivered their milk to his side door and got their cans in exchange. At that time pasteurizing milk was a new idea in Zanesville, but Mr. Leasure saw the advantage in it and soon had the words "pasteurized milk" lettered on his wagons.

Mr. Leasure manages to keep just a pace ahead of his competitors in service to his customers. He was the first producer within the reach of Zanesville to put out a special baby milk.

For fifteen years Mr. Leasure and his wife, whose help has been a very distinct factor in his ultimate goal, conducted that basement dairy which kept growing as people realized the value of milk in the diet, until three wagons were sent out every morning on delivery.

All this time the farm bee kept buzzing in his ear and he kept thinking of the time when he would be producing the milk, good clean milk, such as he wanted his customers to have, and letting other folks deliver it to the consumer.

His big difficulty lay in getting a farm of suitable size and location. His present farm is the third one he has bought. He sold each of the family out and they will all be gether once more.

A large compressed air pump nishes an abundance of water to dairy barn from a nearby spring. drain back of each row of stanchi makes daily flushing of the conc floor easy. Each cow has her i vidual drinking cup.

A cow is certainly sure of her ing there, unless she's a boarder, in that case she isn't there.

A farm plant gives all the elec light that is wanted. Riding by the early evening and seeing lights shining through the side dows, a passerby might take building for a church rather tha cow barn.

In his milk room are a cooler, c ing tank, bottle washer, bottling chine, separator, and other thi that go with an up-to-date busin The most attractive thing about milk room is the clean look and clean smell—two pretty good way telling when things are clean.

The most of his milk is bottled sold wholesale. He gets from seve eight cents above the usual price retails at twenty cents a quart.

Mr. Leasure is making a sidelin hogs and poultry and feels sati with the returns from them. He them when they are about six mo old.

He keeps strict account of the turns from his 250 White Legh

ens and found they netted him 35 in the month of February. That as the month when eggs were com- ig down in price. He feeds them ac- ording to directions from the uni- ersity. He's not skeptical about those niversity bulletins. He says farmers ught to read them and try them out.

Altogether, Mr. Leasure thinks the rmer's future looks at least a little etter than an undertaker's. He akes no claims to eminent success, ut if success can be measured by a ank account and the estimation of is friends and neighbors, then he as at least attained a measure of tisfaction.

He is past what is generally called ie middle age of life and feels that e can offer two valuable tips to ther farmers or to men in any oc- upation.

Each man should make his wife his artner. He says he never even buys cow without first consulting Mrs. easure. On the other hand, she ways consults him before making lans of any consequence. This has rought about a successful marriage s well as successful business.

The other bit of advice is found the Bible: "Beware lest thou for- et the Lord, which brought thee orth out of the land of Egypt." He aid further, "There is no success ithout faith in a Supreme Being. e all need more good, old fashioned eligion without so much sidetrack- ng."

News From Washington, D. C.

[Special to Hoard's Dairyman.]

Washington, D. C., May 9—At the cent meeting of the Executive Com- ittee of the American Dairy Fed- ration here, the matter of American articipation in the World Dairy ongress to be held in Great Britain June and July, 1928, was thor- ughly discussed. Sailing dates will e either May or before the middle f June, next year. The trip will ake four weeks or more.

There was a sharp upturn in the roduction of oleomargarine in the onth of March, according to the re- orts just now available from the ureau of Internal Revenue. This as to be expected, as illustrating ie result of butter prices on oleo- argarine consumption. The figures or the first three months of 1927 nd comparisons with the same peri- d in 1926, compiled by the National airy Union, are as follows:

	Colored	
	1926	1927
nuary	927,196	1,099,180
bruary	930,570	982,678
arch	1,088,016	1,193,730
	Uncolored	
	1926	1927
nuary	20,573,720	20,759,940
bruary	20,550,480	19,373,360
arch	20,179,520	26,040,196

With the end of the sessions of the arious state legislatures, most of hich have been meeting this year, ie information is reaching govern- ent officials concerned here of the ry general approval of the work tuberculosis eradication, and of neral legislative appropriations for rrying on this work in co-operation ith the Bureau of Animal Industry the U. S. Department of Agricul- re. Complete reports are not avail- le as yet, but with thirty states re- rted, appropriations of nearly sev- n million dollars are now made. The rgest appropriation reported is in ew York, where it is evident that a termined effort is to be made to lean up." Twelve of the thirty ates reported have made the me appropriation as last year; in all the others a materially larger amount is provided.

The problem of Farm Relief was forced into the deliberations of the annual convention of the United States Chamber of Commerce last week, in spite of the effort of the leaders in this big organization to hold this back until their own committee of business men studying the problems of agriculture could report. While the matter did not finally receive any vote or action, a resolution was adopted by the agricultural section of the Chamber, at their divisional luncheon meeting, reading as follows:

"Resolved, That American agriculture in common with industry and labor should be protected by the government in its domestic markets to an extent and degree comparable with the protection afforded by the government to labor and industry in other lines." This resolution was the subject of a long and, at times, somewhat heated discussion. John D. Miller of the Dairymen's League was on the program and gave strong endorsement to the co-operative marketing work of the dairy industry, without discussing the general matter of farm relief in any detail. The resolution was specifically endorsed by Louis J. Taber, Master of the National Grange; Charles A. Ewing and other representatives of midwest business organizations; and Former Assistant Secretary of Agriculture, Carl Vrooman.

Alfalfa Seed Must be Stained Orange-red

Secretary of Agriculture Jardine has lately announced his determination that alfalfa seed grown in South America is not adapted for agricultural use in New England, Middle Atlantic, and Middle Western and Western States but in certain of the Southern States it is believed that satisfactory crop yields may be expected. Accordingly, on and after July 2, 1927, alfalfa seed grown in South America will be permitted entry into the United States only if at least ten per cent of this seed is stained an orange-red color.

Uncle Ab says we are made by what we do today rather than by what we did yesterday, or intend to do tomorrow.

The *fourth* furrow *Free!*

Here's an easy way to increase farm profits and without so much work as your present methods. Big reserve power plus easy handling cuts production costs. Amazing new features double tractor life. New low price brings adequate power within reach of every farmer.

Plow *four* furrows where you turned 3 before. In less time. At lower cost. With less work. Think what it means for one man to do a third more work on every tractor job!

Why scrimp along over-loading power too light for the job? Especially when you can now have an Allis-Chalmers 20-35 at little or no greater first cost. At $34.18 per h. p. (Nebraska State Tractor Tests) Allis-Chalmers offers you the outstanding power value. That's on first cost alone. That's only *one* thing.

Dollar for dollar of operating costs an Allis-Chalmers saves cash, for it works faster. Besides Allis-Chalmers has added years to tractor life by keeping moving surfaces free from grit.

The fourth furrow free? Yes, indeed! More work per man and per hour. Less time per job. Easier on driver, on tractor, on your purse. Get the facts today.

VICTOR DAIRY PASTEURIZER

for the FARM DAIRY *and* SMALLER PLANTS

REALIZING the need for a simple, efficient and economical milk pasteurizing outfit for smaller plants and farm dairies, *CP* offers the Victor, illustrated above.

The outfit consists of a combined heater and holder, sanitary pump and Alaska cooler. (Bottle filler is not included, but can be supplied at extra cost.) Operation is simple and conforms with all state health boards' requirements.

With a Victor Outfit the small dairyman can produce good, wholesome pasteurized milk just as cheaply and efficiently as the big city dealer. Pasteurization provides safe milk and will increase your business. The Victor is a business builder. Write for full information and prices.

Does better work — lasts longer — and costs less

A Wisconsin Milk House

THE accompanying diagram illustrates the building of an economical milk house and stock tank to meet the needs of a Wisconsin dairy farmer. The building is a monolithic concrete construction, for which the contractor had the necessary forms.

The special problem here was the placing of the cooling tank in such position that its overflow would fill a stock tank that, in turn, would give head enough to fill water cups in the barn. This was accomplished by placing the milk house at one corner of the barn where the ground reached to the bottom of the stable windows.

This Wisconsin milk house is 10'x14' outside measure with concrete walls and shed roof. The side walls are reinforced with No. 9 wire fencing and the roof with ½" rods 12" on center crosswise and ⅜" rods 16" on center lengthwise. The cooling tank is 8' long by 2' wide with ⅜" rods for reinforcing spaced 12" on center each way. The storage tank is 6'x12'x3½' inside measure and holds 1800 gallons.

This gave a permissible depth of 3½ feet to the stock tank, the bottom of which was still slightly above the height of the water cups in the stable.

The water for the cooling tank is piped underground from the well and is so piped as to carry water into the bottom of the cooling tank. This gives a better circulation in the tank that insures cooler water throughout and that tends to aerate the water and automatically clean the tank.

The cooling tank has a plug in the bottom for cleaning out and the overflow runs direct to the 1,800-gallon stock tank. This latter tank also has an overflow and clean-out which extend to the same drain as the clean-out from the cooling tank and the drain in the milk house floor. The clean-out consists of a receptacle or pipe coupling set in the bottom of the tank and into which the two-inch overflow pipe is screwed. When desired to empty the tank, the overflow pipe is easily removed and reinserted when cleaning is completed.

The supply to the barn is taken from one end of the stock tank at a point one inch above the bottom. The stock tank also has a manhole with the usual cast iron cistern cover, so that the tank may be cleaned or repaired when necessary and still insure against danger of children falling through a defective wood cover.

As a protection against severe cold weather when the cooling tank may freeze, the water from the pump may be diverted directly to the stock tank. This is accomplished by piping the water from the pump into the barn from which it goes through the wall to separate pipe to both the cooling tank and the stock tank, either of which may be shut off with proper valves.

The bottom of the cooling tank would have been placed a foot below the milk house floor, except for the necessity of using the stock tank as a supply for the water buckets in the barn.

To provide against partially filled cans of cream tipping over in the cooling tank, pulleys are inserted in the ceiling so that a light rope with a weight at one end may be attached to the cans and keep them upright. Possibly a better system would be to have hinged rods at the top of the tank that would keep the cans submerged.

New Traffic Code

Automobile accidents in Minnesota should be materially reduced if all motorists and others using the streets and highways will carefully observe the new traffic code which went into effect when it was signed by the Governor recently. A number of safety rules which have long been observed by cautious motorists but disregarded by others, have been written into the law. Hereafter it will be unlawful to:

Stand in a roadway to solicit a ride, except from a public conveyance.

"Hitch" to motor vehicles with toboggans, sleds, or bicycles.

"Coast" cars down grade, with gears in neutral.

Jump on or into a vehicle without the owner's consent.

Board any public conveyance while in motion.

Display bathing beauties, campaign cards, or other posters on windshields or windows.

Use a muffler cut-out on any highway.

Operate a car without a wind shield wiper.

Make unnecessary noise, or operating a vehicle as to emit excessiv smoke.

Use siren, compression, or spark plug whistles on any except police o fire vehicles. Police and fire car must be equipped with a siren, bel or exhaust whistle.

Use red or green lights visibl from in front of any vehicle, excep police and fire vehicles.

Place cars with "For Sale" sign on streets or highways.

Use a bicycle at night without front light and a red or yellow re flector or light in the rear.

Like the old law, the new cod fixes no positive speed limits, bu places upon the driver the respons bility for operating his car with du regard for the safety and rights o others. It provides that he must nc operate his car at a greater spee than is reasonable and proper, wit due regard to the traffic, but make operation of a car above certai speeds prima facie evidence of reck less driving.—Minn. Highway News

Lead me to P. A. every time

I KNOW what I like in a smoke, and what I like is Prince Albert! Why, the minute breakfast is over, I reach for my pipe and the well-known tidy red tin, and we're off . . . off on one of the grandest smoke-joy-rides a man ever took. It's like that all day long.

You understand my enthusiasm the instant you open a tin of Prince Albert and drink-in that wonderful P. A. aroma. You're reminded of a trek through the woods, when the dew is on the leaves and the sun is on the up. Fragrant promise of a glorious taste to come.

Then you load up and light up. You notice that the smoke is equally fragrant . . . fragrant and refreshing. It pours over your tongue in a cooling torrent that knows no bite or sting. Mild, too, with a mildness that says: "Come and get it." I'm talking about P. A.!

I have tried to give you a snapshot of the joys that await you in a pipe packed with Prince Albert. If the picture isn't clear, blame *me*. The complete story is in the tidy red tin at the nearest tobacco-shop. The only way you'll really know P. A. is to *smoke* it.

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

—no other tobacco is like it!

© 1927, R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

SHERWIN-WILLIAMS

There's a *joker* in the *cheap* paint can!

WHEN you are tempted by a "low price" and alluring promises to use "cheap" paint on your house—*STOP!* There's a joker in every can. It may *look* like paint. It may *smell* like paint. But before you buy remember this:

If the Sherwin-Williams Company with its years of experience—its skilled paint experts—its great laboratories—its enormous volume—cannot produce *high grade* house paint to sell at less than SWP prices—*no one in the world can do it.*

So whenever you see a "low price" on house paint you can decide that it is made of inferior or skimpy materials. And a *poor paint* is the most *costly* paint you can put on your house.

Let the "formula" prove it

There is one way to prove that a "low price" house paint is merely an inferior paint. Insist upon seeing the formula, either on the can or in the literature. Then compare it with the formula of fine old SWP which you will always find openly printed on every can. Note the big percentage of *White Lead Carbonate* and *White Lead Sulphate* used in SWP Outside Gloss White. White lead should be the *basic* ingredient of all white paint and light tints. It is to these paints exactly what flour is to bread.

See how much less of this basic ingredient is used in the average "cheap" white paint.

Zinc oxide, another costly pigment, is the next essential ingredient. A liberal percentage of zinc oxide combined with a large amount of white lead makes for a *balanced formula*—such as the formula of SWP Outside Gloss White House Paint. It assures a finish of superior wearing quality.

More than 90% of the pigment content of SWP Outside Gloss White is made up of these two important ingredients—white lead and zinc oxide.

In the majority of "cheap" white paints you

THE FINEST HOUSE PAINT THAT MONEY CAN BUY

HOUSE PAINT

will find only 50%, sometimes even *less*.

It is the liberal quantity of this expensive basic material in every can of SWP Outside Gloss White that gives this fine old paint its remarkable covering capacity.

In the darker colors like browns and greens, the "*balanced formula*" of SWP is even more important.

Naturally, these dark colors can contain little, if any, opaque white pigment such as white lead or zinc oxide.

Sherwin-Williams have the pick of the world's colors. Sherwin-Williams Dry Color Works produce practically everything except the natural earth and mineral colors.

That is why beautiful SWP colors are so rich, so permanent and so true to character.

Greater durability of the paint film on your house is assured by SWP due to the use of a specially treated, pure linseed oil—made in Sherwin-Williams' own linseed oil plant.

Why SWP *costs you less*

One evidence of quality in a house paint is the way it *hides the surface* and in the *area it covers*.

A gallon of fine old SWP will properly cover 360 square feet (two coats).

A gallon of "cheap" paint will cover *only 250 square feet* (two coats)—110 square feet (two coats) *less* than SWP House Paint.

That is one side of the joker in the "cheap" paint can.

Where only seven gallons of SWP will finish the average house, *eleven* gallons of "low price" paint are needed.

SWP costs more per gallon. But it covers *44 per cent more area*. So it costs no more than *cheap* paint by the job. Which would you rather use?

Prepared house paint—*at its best*

Being made of best quality materials, SWP dries to a tough, elastic, glossy finish.

There is no chipping, cracking or peeling. It weathers slowly. Lasts usually for five years.

When repainting *is* needed, you save paint, time and money *because the SWP surface is in proper condition.*

A "cheap" paint frequently chips, cracks, peels and fades in a year or so. It gives an inferior finish—and a much shorter life than good paint.

Repainting is more frequent and costs more for paint and labor because the old paint has to be burnt or scraped off.

That is the *other side* of the *joker* in the "cheap" paint can.

SWP *beauty!*

With fine old SWP you always get a beautiful paint job. Your house looks like new. The colors are especially rich—with a sheen like fine old pottery. And they are weather-fast—slow to fade.

Even after several years of exposure, a washing with plain soap and water will bring out their beauty almost like new.

Contrast this with cheap colors that look dull and wishy-washy almost in no time.

Which would you rather have—when SWP is guaranteed to cost less per job and much less per year?

See "Paint Headquarters" and save money

These are facts which every property owner has a right to know about house paint. They are attested by a concern whose standing we do not believe any man would question. The simplest way to prove them is to make the comparison suggested.

SWP House Paint is sold the world over. Each Sherwin-Williams dealer is "Paint Headquarters" in his vicinity. See the one near you. Before you let any low price blind your better judgment, get his advice. Compare formulas. Don't be fooled. If you want literature, color cards, help on a color scheme or the famous Household Painting Guide, write us.

SWP

Guaranty of Satisfaction

SWP House Paint, when thoroughly stirred and applied according to directions, is hereby guaranteed to cover more surface, to look better, to last longer and cost less per job and per year than any house paint on the market.

Woman's Greatest Hygienic Handicap

As Your Daughter's Doctor Views It

Because of the utter security this new way provides, it is widely urged by physicians—ABSOLUTE SECURITY, plus freedom forever from the embarrassing problem of disposal

A free test offered—mail the coupon

By ELLEN J. BUCKLAND, *Registered Nurse*

SIXTY per cent of many of the commoner ailments of women, according to some medical authorities, are due to the use of unsanitary, makeshift ways in meeting woman's most distressing hygienic problem.

For that reason, this new way is widely urged today. Especially in the important days of adolescence. On medical advice, thousands thus started first to employ it. Then found, besides, protection, security and peace-of-mind unknown before. Modern mothers thus advise their daughters—for health's sake and immaculacy.

You owe it to yourself, your daughter, to learn of this new way. A free sample will be sent you, in plain envelope, if you mail the coupon.

Kotex—what it does

Unknown a few years ago, 8 in every 10 women in the better walks of life have discarded the insecure "sanitary pads" of yesterday and adopted Kotex.

Filled with Cellucotton wadding, the world's super-absorbent, Kotex absorbs 16 times its own weight in moisture. It is 5 times as absorbent as cotton.

It discards easily as tissue. No laundry—no embarrassment of disposal.

It also thoroughly deodorizes, and thus ends *all* fear of offending.

Only Kotex itself is "like" Kotex

See that you get the genuine Kotex. It is the *only* pad embodying the super-absorbent Cellucotton wadding. It is the *only* napkin made by this company. Only Kotex is "like" Kotex.

You can obtain Kotex at better drug and department stores everywhere, without hesitancy, simply by saying "Kotex." Comes in sanitary sealed packages of 12 in two sizes: the Regular and Kotex-Super.

Today mail the coupon for a full-sized sample of Kotex, *free*. Note the improvement, mental and physical, this new way brings. Important booklet on "Personal Hygiene" will be sent also, both in plain envelope. Send for *your* sample today.

Shelter for Farm Machinery

H. B. WHITE, Minnesota College of Agriculture

THE need of shelter for farm machinery is greater as such equipment is made more com- on the farms and more compli- d in its construction. It takes but t abuse to ruin a watch or auto- ile while a harrow will stand con- rable misuse.

he implement shed for the aver- farm should be carefully located are at both sides so that the team can do all the moving of the implements, that is, the implements are brought in from one side and taken out of the other.

A shed for the average farm is shown in Fig. 2. It shelters the farm implements and auto as well as furnishing a farm shop which on many farms will be a good investment and

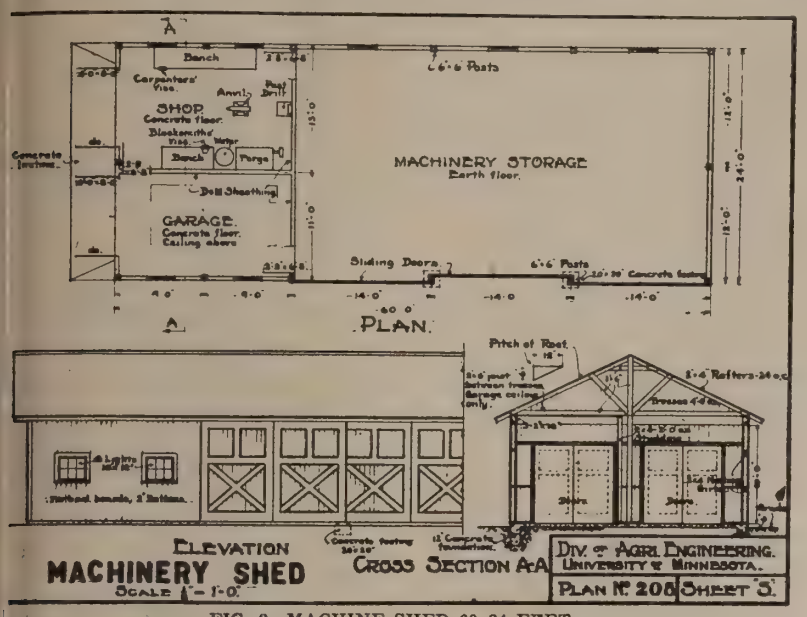

FIG. 2—MACHINE SHED 60x24 FEET

hat time will not be wasted in ng the equipment under shelter. his is not given careful thought mplements will be left exposed to action of the weather and damage stock rather than placed under er.

here are at least three types of ement sheds that may be con- ed by the average farmer and he ld make a careful study of his s to decide which will best meet methods of farming and care of ements. The first type of build- is usually nearly square and the unt of storage space is large in portion to the amount of wall e of the building. This type of ling is usually not very conveni for the removal of any particula ement.

he second type is very common he Middle West and is a long ling with stalls or bents where machine has its own particular and can be taken out and used returned with very little incon- ence. There are many variations he details of roofs, doors, etc. y are simple shed roof buildings nown in Fig. 1. Sometimes doors added later. In some cases it has most satisfactory where doors

enable the farmer to keep his boys interested in mechanical equipment and often result in the boys staying on the farm. The construction is shown on the plan. Posts and nailing girts are used and the boards

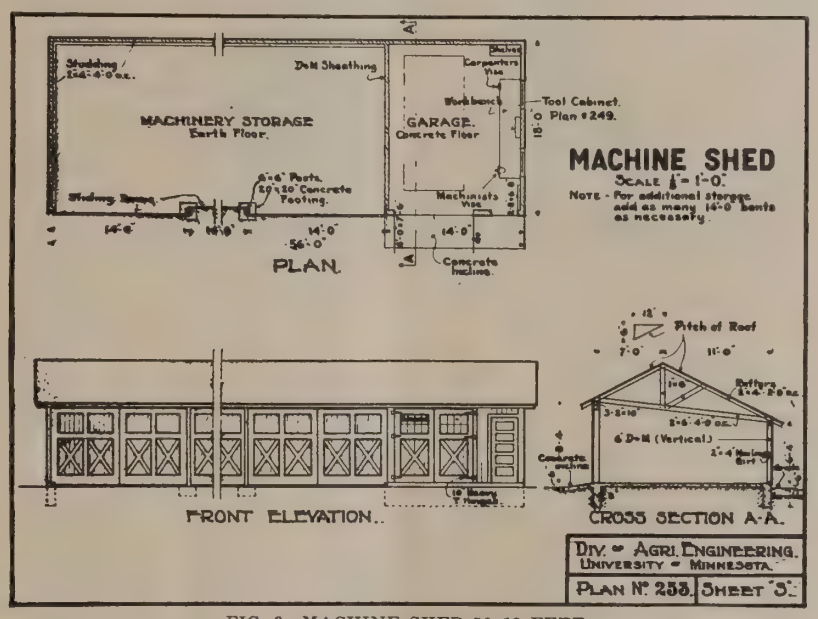

FIG. 3—MACHINE SHED 56x18 FEET

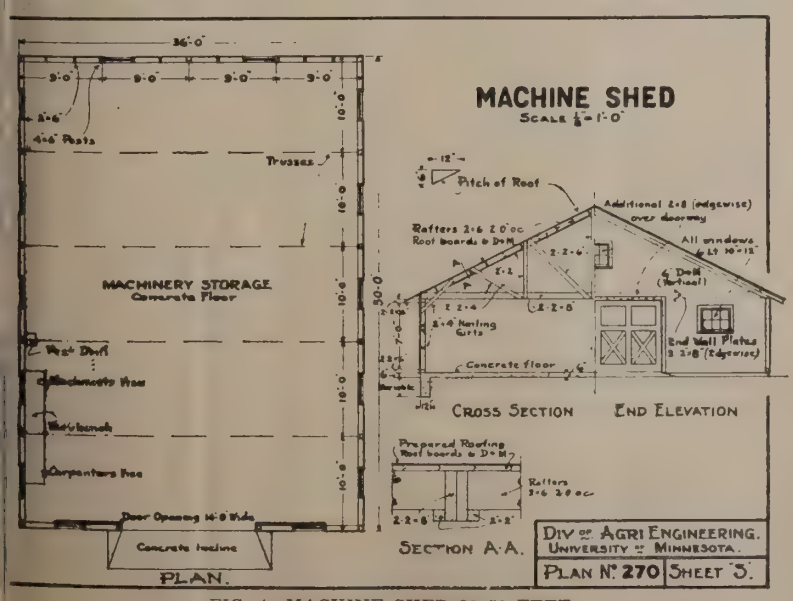

FIG. 4—MACHINE SHED 36x50 FEET

FIG. 1—SHED ROOF IMPLEMENT SHED

are vertical with battens on the cracks. The space for the auto and shop may be boarded up to protect them from dust. The space over the garage will probably be used for storage of small pieces of equipment, supplies, etc.

The building in Fig. 3 is 18x56 and although not so large or complete as the one shown in Fig. 2, it is found to be a very satisfactory addition to the buildings on the farm. The plan shows a concrete floor in the garage and shop. This will in many cases be omitted because of extra cost. It is of course desirable as much work is done in a farm shop if it is in a convenient location and equipped with the most frequently used tools for woodwork, iron work, etc. The plan shows the measurements necessary for erection of this building by the carpenter who is familiar with farm building construction.

A third type of implement shed, shown in Fig. 4, is not yet very common but if mechanical equipment is to increase in the future as in the last two decades, a building with doors at the middle of each end and a driveway lengthwise with a row of stalls for implements along each side will soon be seen on many of the larger farms. The space along the middle is very useful for vehicles, auto, etc., and is valuable for shelter in many emergencies. The concrete floor is necessary in this case so that the machine may be moved by hand.

The equipment for the farm should be considered carefully in deciding the size of implement shed. The following measurements will aid in determining the space necessary: Automobile, 7 x 14 feet of floor space; buggy, 5 x 10; binder, grain, 9 x 14; binder, corn, 6 x 12; corn cultivator, 5 x 8; corn planter, 6 x 6; disc harrow, 6 x 8; gang plow, 5 x 10; grain drill, 5 x 12; hay loader, 9 x 10; hay rake, 6 x 10; mower, 5 x 8; manure spreader 8 x 16; wagon, 7 x 12.

It is poor economy to slight the construction of implement sheds as only by a long period of use with small outlay for repairs will a building prove profitable and a source of pride and satisfaction.

Now *accuracy* replaces "makeshift measure"

The old-fashioned practice of judging values by the size of the package, bundle or measure is *costly*. Thousands of buyers and sellers have learned this: The only way to measure actual quantity is by *actual weight*. "Makeshift measure" must go.

It is only good business to weigh everything you buy and sell. Use a scale to check values given and received, the same as you count your change. Otherwise you lose in the end — often a big sum of money in a year.

Use a Fairbanks Scale — dependable for nearly a century. Due to big Fairbanks production, you can now put a Fairbanks Portable Scale on your farm at unbelievably low cost. See your dealer.

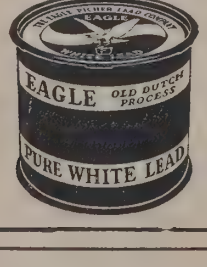
Quickly prepared for painting

—another Eagle economy



BY THIS new quick method of preparing Eagle Pure White Lead your painter can break up 100 pounds of Eagle to paint consistency in less than ten minutes — making Eagle Pure White Lead Paint the easiest paint to prepare for the brush.

Two factors make this economy possible — the unique design of the Eagle keg, and the smooth uniform consistency of Eagle White Lead.

The tough elasticity of Eagle, its great protective power, and now this new quick break-up —these advantages make Eagle Pure White Lead paint the choice of careful farmers everywhere.

Write today for free folder which describes this new Eagle time-saver. *The Eagle-Picher Lead Company, 134 North La Salle Street, Chicago.*

WHITE LEAD
OLD DUTCH PROCESS

We are always pleased to receive suggestions in regard to every department of Hoard's Dairyman.

DAIRY MARKET NEWS

Wisconsin April Condensery Prices

Forty-six condenseries reported to the Wisconsin Department of Markets the prices paid in April per hundred pounds milk delivered at their factories. Reduced to a common 3.5 per cent test basis, these prices ranged from $2.01 to $2.50, the average being $2.15.

Nineteen factories sent delayed reports for March, the average being $2.25. This is four cents above the previously reported average of $2.21 for 47 factories.

April Cheese

Cheese prices on the Wisconsin Boards averaged 22.2 cents on single Daisies, a decline of a half cent from March but is still over three cents higher than April of last year. Production still continues nearly ten per cent under last year and total cheese stock are seven per cent less. With the exception of 1925, when the April price was a half cent higher, this is the highest April price by 1.5 to 6 cents that has occurred since 1920.

The first two weeks of May saw little change in cheese prices, there being a decline of two-tenths of a cent in the average. Prices now are at a slightly higher level than the last of April, and are nearly four cents above a year ago. Total storage of cheese on May 1 is three million pounds less than last year, but is nearly ten million greater than the five-year average.

Cheese production for the first three months of the year totaled 74,253,000 pounds, a decrease of nine million pounds from last year. Net imports were 17,148,000 pounds, an increase of nearly six million pounds. Storage stocks at the close of March were 47,807,000 pounds, a decrease of over three million pounds. This brings the total estimated trade output for these three months to 115,649,000 pounds, a decrease of 3.6 per cent in apparent consumption of cheese as compared with the same period last year.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market during April:

	April 1927	March 1927	April 1926
	Cts.	Cts.	Cts.
Twins	21.7	22.2	17.9
Single Daisies	22.2	22.7	19.0
Longhorns	22.1	22.6	19.4
Square Prints	22.8	22.7	19.3
*Receipts since Jan. 1	56,175	40,374	56,212
*Receipts for month	15,801	14,170	14,526
*Storage end of month	9,202	10,629	15,448

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—000 omitted.)

Sheffield's April Milk

The cash price for April, 1927, paid Sheffield Producers of New York for three per cent, Grade B milk in the 201—210-mile zone is $2.395 per hundred pounds, with the usual freight and butterfat differentials. This is equivalent to $2.595 for 3.5 milk.—C. W. HALLIDAY, Secretary.

Philadelphia Milk Prices

The Inter-State Milk Producers' Association announces that the May basic price for milk will be $3.29 f. o. b. Philadelphia and $2.71 per hundred at receiving stations in 51—60-mile zone.

The April surplus prices were $2.60 first surplus and $2.10 second surplus f. o. b. Philadelphia. The April surplus prices at all receiving stations on railroad were $2.03 first surplus and $1.62 second surplus.

These are based on milk testing 3 per cent butterfat with a differential of 2 cents for each half point of test up and down.

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on May 1, figures being given in thousands of pounds (000 omitted):

	May 1 5-yr.-av.	May 1 1926	May 1 1927
	Lbs.	Lbs.	Lbs.
Butter, Creamery	7,451	17,527	3,432
Cheese, American	22,578	35,597	32,491
Cheese, Swiss	4,388	5,310	5,577
Cheese, Brick	1,123	1,573	1,476
Cheese, Limburger	599	957	1,335
Cheese, All other	4,691	4,013	4,746

These holdings include stocks in both cold storage warehouses and packing house plants.

Wisconsin March Butter

Wisconsin co-operative creameries paid producers a net price of 55.7 cents a pound for butterfat in March according to reports from 90 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 49 cents a pound for butter, making a spread of 6.7 cents between the price received for butter and the price paid for fat.

The range in price paid for fat was from 50 to 59 cents, with the price received for butter ranging from 47.6 to 49.9 cents. The overrun ranged from 21.5 to 23.8 per cent. Receipts of butterfat averaged 28,616 pounds per creamery.

Monthly butter prices have consistently averaged several cents over the corresponding months of the preceding two years, with April at six to eleven cents above the same month the past two years.

April Butter

April butter averaged 50.3 cents in New York, the highest record since 1920. This is slightly above March and is 10.9 cents above April a year ago. The month has been characterized by a series of ups and downs, with a decided drop during the closing days that was continued into May.

Storage stocks are practically at the vanishing point, being about one-half of one day's railroad receipts. Current trading stocks are also low and production is lagging. Lighter receipts coupled with reduced stocks help to explain why the markets have been so sensitive. A slight change in the receipts of a single day has been sufficient to bear or bull the market several cents in a few hours. It is probable that the high prices prevailing have been a controlling factor in making buyers cautious in fear that consumption will decrease. Imports have also been a factor, the total for the first four months of the year will exceed 1926 by approximately two million pounds. The first two weeks in May held fairly steady at the prices prevailing the last few days in April, the average for the period being 44.2 cents at New York. This is a decline of six cents from the April average, and is ascribed to increased production over the previous periods. Some reports, particularly from the Southwest, show increased production over last year, but the Land O' Lakes reports indicate a decrease. The prices are now some four cents above the same period last year.

Total holdings of cold storage butter on May 1 were nearly three and a half million pounds, which is less than half the five-year average and one-fifth the storage last year.

Creamery butter production for the first three months of the year was 296,837,000 pounds, an increase of over three million pounds greater than a year ago. Net imports were 2,646,000 pounds, an increase of nearly two million pounds. Storage holdings w 3,033,000 pounds at the close of March, over fourteen millions pounds less than year ago. This brings the estimated total put for these three months to 436,418 pounds, a decrease of four-tenths of one cent in apparent consumption of butter f that of the same period last year.

Daily quotations from the U. S. Dep ment of Agriculture show the following a age wholesale prices on 92-score butter tras) at four of the principal markets, tog er with receipts and storages:

	April 1927	March 1927	A 19
	Cts.	Cts.	C
Chicago	48.1	49.4	
New York	50.3	50.2	
Boston	51.1	51.0	
Philadelphia	51.3	51.1	
*Receipts for month	46,777	44,108	43
*Receipts since Jan. 1	165,110	118,333	166
*Storage (end of month)	960	1,363	8

*In thousands of pounds at the four m kets (i. e.—000 omitted.)

Ninety-score butter averaged 47.0 cents April in Chicago, with centralized butter this market selling for 47.8 cents. Jobb prices on extras sold to retailers averaged cents in Chicago, a spread of 2.5 cents a wholesale.

April Foreign Butter

The following table of foreign butter pr gives the average of weekly quotations as lished by the U. S. Department of Agricult

Market	April 1927	March 1927	A 19
	Cts.	Cts.	C
New York	50.3	50.2	3
Chicago	48.1	49.4	3
Copenhagen	35.6	36.7	3
Berlin	36.4	37.2	3
London:			
Danish	38.3	39.3	3
Dutch*	37.7	38.9	3
New Zealand	33.2	33.7	3
Australian	33.0	33.0	3
Argentine*	33.5	32.2	3

*Unsalted.

April is the sixth month in which the m gin of price between Copenhagen and York has been greater than the tariff o cents. Importations into the United State high grade butter, principally from New land, have continued well into April, the cl upon rather steady importations since November coming only with the seasonal cline in domestic prices.

Feed Market Situation

(By The Grain, Hay and Feed Market N Service U. S. Department of Agriculture.

With a continued brisk demand for scanty offerings of feed of all kinds, toge with advancing prices for feed grains, qu tions for feedstuffs have averaged higher ing the past two weeks although the peal bran and linseed meal prices seems to passed. Demand in general has become smaller volume as the pasture season has tended northward but dealers' stocks been depleted and there is still an urgent mand in the Northeast for feed on hand o nearby positions. Pasturage, however, is veloping rapidly and the average condition pastures on May 1 was 87.0 per cent normal compared with 74.6 a year ago 82.6 for the average of the past ten years this date.

Bran has become slightly easier at the p ent writing (May 10) but middlings rece scored a sharp advance in the Northw Higher prices for wheat have made it ea for mills to get shipping instructions on which was contracted some time back and has helped to increase the production of w feeds slightly.

Linseed meal has turned slightly easier a slack demand for the limited output. were offering more liberally at Buffalo though quotations at that market were changed and prices declined around 50c Chicago and Minneapolis.

Alfalfa meal shared to a slight extent in firmness of other feeds and prices were vanced about 50c a ton at Kansas City the medium grades. Top grades were wa at Chicago but off grades were slow sale that market.

	Buffalo	Philadelphia	Cincinnati	Chicago	Minneapolis	
Bran*	32.00	35.75		31.25	28.00	
43% C. S. meal	41.50	42.75	37.50	39.00	38.00	3
34% L. S. meal	47.00		51.00	49.00	47.50	5
Gluten feed	35.50	35.60	33.00		33.30	
Hominy	34.50	34.50	31.50	30.50		2

*Standing spring bran. Hard winter w bran was $35 in Buffalo and $28 in Ka City, with soft winter wheat bran $34.5 Cincinnati.

First Emmadine Sale Averages $656

The first event of this year's an-ıal Guernsey week was the Emma-ne sale. Since this institution has ·en widely heralded in both farm and ty press as the first endowed breed-g institution, many were on hand ·ay 9 determined to nod or wink ·equently at Auctioneer George ain, should competition make it ·cessary. By parading the Fore-osts and other headliners the day ·evious to a considerable audience, ·anager Dodge started the ball roll-·g in an excellent manner. The ilking herd and battery of herd res, namely Langwater Foremost, horewood Resolute, Mixter May oyal, and Langwater Valor—whose ombined purchase price approxi-ates $60,000—were also studied ırefully. The stability of Emma-ne is quickly grasped by those who ıunter about the various barns ·rutinizing the integral parts of this ·eat breeding institution.

This was the first Emmadine sale—ıe curtain raiser for a long and in-·resting series of annual events. At ·actly twelve thirty, Manager Dodge ·epped to the box and made a few ·planatory remarks. He was fol-·wed by Robert Scoville, President, ıd Karl Musser, Secretary, of the merican Guernsey Cattle Club; ouis Merryman; and Auctioneer ain. Forty-three Guernseys passed ırough the ring during the next ıree and one-half hours. Their final estinations will find them in eleven ·attered states.

The animals bringing $500 and ver and their purchasers are:

. Schaaf, New York	
Cosquay Frances	$550
Beechwood Lady Isabelle	775
reidablik Farm, Delaware	
Foremost's Aurice	$1,050
. F. Herrick, Massachusetts

. J. Flint, Rhode Island	
Freckles of Rockingham	$550
hos. H. Munro, New York	
Elnora Vesta's Queen	$625
ohn Clark, New York	
May Royal's Dimple	$1,000
'm. B. Ward, New York	
Imp. Risbecq of Vimiera II	$650

At the Emmadine Ringside

Nine Foremosts, mostly young, rought $9,525, an average of $1,059.

Bain's one and only joke: "Nigger, hat would you do if you received a etter from the K. K. K.?"

"Boss, I'd read that theah lettah n de train."

We hope Mr. Penney will get an ven break on the weather next year. steady downpour chose sale day o help the fields of the farm do their it this year.

Top female was Wedgmere Favor-e, a daughter of Langwater Stead-fast. She brought $2,100 and went to G. W. Dayton, Minneapolis.

Five Resolutes averaged $325.

Seven Mixter May Royals averaged $665.

Two Valors averaged $550.

T. Chatham, North Carolina, bought the top price male. The price was $3,300 for Foremost's Gay Lad.

The 43 head brought $28,200, an average of $656.

Does Sour Cream Test More

Professor E. H. Farrington of the Wisconsin College of Agriculture discusses this question in a bulletin recently issued by the college.

He reports that a series of very exhaustive tests show that despite some belief to the contrary, cream will test no more when sour than when sweet. In every trial which he made the tests of cream were identical when it was sweet and when it was kept until very sour, except in those cases where the cream was kept in an open can and some of the moisture allowed to evaporate.

He explains that the difference between the tests of sour and sweet cream largely results from the difficulty of securing an accurate sample of the entire amount of sour cream. Sour cream is not only more difficult to mix so as to take a fair sample, but it is also possible that in taking some sour cream samples, small lumps of butterfat may be added to the test bottle. This, of course, would increase the test of that particular sample of cream.

The Farmer's Poultry House

(Continued from page 555)

hopper and feed bin built on the wall for each pen. Stands are made for the drinking pans and small vessels are made to hold the grit and oyster shell. The hoppers to contain the grit, shell, and dry mash are self-feeders. Dropping boards are made thirty inches from the floor. The roosts are made of two by two material and are placed ten inches above the dropping boards. Fourteen inches below the dropping boards a shelf is made. Between this shelf and the dropping boards the trap nests are placed. All equipment is made movable for ease in cleaning.

In this style of house fresh air enters by filtering through the cotton and, as it becomes warm in the house, it rises through the slatted ceiling carrying with it moisture given off by the birds. The straw in the loft acts as an absorbent for the moisture, and the air entering the loft through the doors in the gables keeps the straw dry. By this system fresh air enters the house without creating a draft. Sunlight passes through the glass and cotton, providing an abundance of light and keeping the pens cheerful.

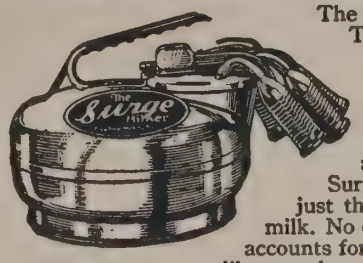
Ventilation, But No Drafts

The construction of the house in general should be draft proof so no air can enter save through the cotton. The cotton used should not be of such heavy quality as to keep air from passing readily through it. The cotton should also be kept reasonably free from dust so the pores in the cloth will not become clogged.

While the dimensions of the house described are sixteen by thirty-two feet, the tendency at the present time is to favor the deeper house. By adding to the width it is possible to have the birds roosting farther from the cotton during the night. It is during the night the greatest trouble is encountered with frost bitten combs. At the Experimental Farm at Brandon, houses of the type described and shown in the illustrations have been used for several years with entire satisfaction. There have been few cases of frost bitten combs and pullets lay even during the coldest weather.

Bill of Material

The following is a list of material required to erect the poultry house described above:



19 2x4 studs 7 feet long (rear wall)
4 2x4 plates 16 feet long
4 2x4 studs 8 feet long (end walls)
4 2x4 studs 9 feet long (end walls)
4 2x4 studs 10 feet long (end walls)
4 2x4 studs 12 feet long (end walls)
13 2x4 studs 7 feet long (front wall)
4 2x4 pieces 12 feet long (front wall)
6 2x4 pieces 16 feet long (front wall)
4 2x6 window sills 16 ft. long (front wall)
34 2x4 rafters 10 feet long
34 2x4 ceiling joists 16 feet long
4 2x4 pieces for partitions
70 pieces 1x6 drop siding 16 feet long
680 feet of roofing board
18 pieces 1x10 shiplap lining 16 feet long
18 pieces 1x10 shiplap lining 12 feet long
4 pieces 1x10 shiplap for partitions
4 pieces 1x6 shiplap lining 16 feet long
78 pieces 1x3 ceiling slats 16 feet long
6,000 shingles
2 pieces 1x5 finish 14 feet long
2 pieces 1x4 finish 14 feet long
4 pieces 1x4 finish 12 feet long
8 pieces 1x5 finish 12 feet long
4 pieces 1x5 finish 18 feet long
20 pieces 1x3 finish 12 feet long
4 pieces 1x6 finish 18 feet long
7 pieces 1x6 (T & G) 12 feet long for doors
10 windows 3 light 10x18
2 windows 12 light 10x12
10 yards cotton 36 inches wide
64 lineal feet 2x2 roosts
64 lineal feet poultry netting, one-inch mesh, 30 inches wide
30 bags cement

The Surge Milker
Pine Tree Milking Machine Co.

The Only Milker that

1 gives the cow's teat the Real TUG of the calf—
2 and like the calf—TUGS harder and harder as the cow milks out—
3 and like the calf—gives EACH cow just the TUG she needs!

Milks Like a Calf!

The Surge Milker does MORE than other milkers. The Surge *finishes* the job; other milkers only start it. Other milkers secure the milk by suction; some add a release or massaging action. The Surge does both! And then ADDS *The Real Tug of the Calf!* Yes, and like the calf—The Surge TUGS harder and harder as the cow milks out. AND—a quick, easy Surge Adjustment enables YOU to give *each* cow just the suck and TUG she needs to get ALL the milk. No other milker does or can do ALL THIS—which accounts for The Surge's well known ability to milk cows like no other machine has ever milked cows before.

6 Milkings FREE!

Right in Your Own Barn—With No Obligation to Buy

Mail coupon now for details of our amazing FREE Offer which gives you a chance to prove ALL THIS in your own barn, on your own cows—for 6 milkings FREE—and without the slightest obligation to buy! We also want you to see The Surge Milker milk out "that cow" you're ready now to bet can't be milked by machine. Our attractive price and Easy Terms will be another Surge feature you'll like.

Easy Terms
You can buy a Surge Milker on very easy terms. We'll figure to use any equipment you may have already in your barn. You'll be surprised how little it'll amount to. Mail coupon Now. It doesn't obligate you.

Mail Coupon for Free Book

We have just issued a NEW Surge catalog that tells you MORE about milking and milking machines than anything you've ever read. It's a very valuable book for any farmer milking cows to have. This coupon will bring it to you—FREE.

Mail It Today SURE!

PINE TREE MILKING MACHINE CO. Dept. 98-55
2843 West 19th Street, Chicago, Illinois

Looking at Life With Wholesome Vision

"Suppose that this here vessel,"
Said the skipper with a groan,
"Should lose her bearings, run away,
And jump upon a stone.
Suppose she'd shiver and go down,
And save ourselves we couldn't."
The mate replies,
"Oh, blow me eyes,
Suppose again she shouldn't."

Are you like the skipper, one of these what-if-something-should-happen persons? If you are not, you are extremely lucky for I really believe that enough energy is spent every year worrying about things that never happen to set the world going in fine shape if we could only turn the energy into its proper form.

A letter from a friend this morning quoted something which I think is fine and inspiring. This friend (I call her that though I have never seen her) is one of our readers in Nebraska who has recently gone through a severe illness. During that time she read a book and she feels that if there had been no more in it than this one sentence she would have been repaid for the reading. The sentence is, "We cannot always help what happens to us, but we can help the way we take it." It reminds me of a relative of ours, a perfectly splendid woman but one who made herself miserable worrying for fear her husband would die; she said she could bear anything else but that one thing would kill her. It happened that her husband really did die and a month later I saw her. I expected her to be in a dreadful state and was amazed to find her calm, with a certain philosophic serenity about her that I had never seen before.

"It's terrible," she said. "I cannot tell you how lonely I am without him but I have found out one thing. Nothing, even this, is as bad as we think it is going to be when we sit and worry about it. There is always something that can be done about it and, in my case, I'm finding it in work."

The little book, Byways to Health, about which we were talking in a previous issue, contains some valuable things on the subject of worry which may help you through some problems. I shall again omit quotation marks.

Needless worry never averted a calamity, softened an adversity, nor allayed a sorrow. It encourages unhealthy thoughts, magnifies things of dread, and apprehends danger. Worry injures the nervous system and lowers resistance against infection and disease.

The cause for worry may be a just one and when this is true facing the situation often helps to soften the blow. Marching along bravely with an unpleasant truth takes courage but a calm, direct study of the reality sometimes brings the power to change it, or at least to improve the situation. If the cause for worry cannot be changed, it would seem that the quickest way to gain peace is to refuse to think about it, so far as is humanly possible. Deliberately try to keep it out of your thoughts by substituting for it wholesome thoughts and activities.

Sunshine and fresh air have a wonderful healing, soothing power. When the cause for worry comes to mind indoors and you cannot get out into the sunshine, repeat over and over a favorite poem, passage, or prayer. Make yourself smile; think of anything beautiful that will help exclude the shadow. Taking an interest in good, honest work is a wonderful help.

Sufficient sleep, adequate food, proper elimination, a fair amount of exercise in the open air, reasonably regular hours, and the desire to stop worrying help one to regain a right attitude of mind. Suppose, as is most often the case, that there is a solution to the worry. Trying to find it at the earliest possible minute will help remove it all the more quickly. Face it squarely, ask advice if there is need for it. The answer may not be found right away but you are more apt to find happiness trying to solve the problem than by sitting down bemoaning fate and doing nothing.

The habit of fretting can grow until it is almost impossible to do an efficient day's work or to find happiness anywhere. This may be so to such a degree that it is advisable to see a physician. The cure then lies in following his advice.

Making the best of things which cannot be helped is a high trait of leadership; it helps to smooth rough places and to ease little discomforts. The habit of cheerfulness can become a part of daily living. "Sit up cheerfully, look around cheerfully, and act as if cheerfulness were already there," is the advice of a famous philosopher for acquiring a cheerful state of mind. The habit of cheerfulness can be cultivated not in the attitude of a reformer, but in the wholesome spirit of one who recognizes that there are certain obligations to those with whom we associate daily.

Cheerfulness and happiness have a wholesome effect on the nerves, muscles, heart, and lungs but cheerfulness and happiness alone cannot relieve a condition due to eye strain, diseased teeth, or tonsils; these need medical care.

A wholesome sense of humor has been the salvation of many a man and woman in the daily round of tasks and even deliberately forcing oneself to smile will check the tendency to knit the brows and tighten the muscles. To be able to relax must be learned sometimes but once learned, its benefits manifest themselves in fresh force and energy, in renewed courage and cheerfulness. To lie down completely relaxed for a short time each day is a most desirable form of rest and one which averts many illnesses. If it did no more than rest the heart, it is well worth while and if sleep should come, it is the ideal rest period.

"The two great sins of our modern life," says a well known physician, "are our bad habits of eating and our increasing tendency to live on our nerves." Within certain limits any one may determine the kind of nervous system he will have. He may control worry, he may avoid fears, and he may surmount an irascible temper or moody disposition by constantly seeking for controlled expression, cheerfulness in life, and help for the needs of others. To quote the famous Mrs. Wiggs of the Cabbage Patch, "We can't none of us help what traits we start out in life with, but we can help what we end up with."—LUCY THOMPSON.

Spring Cleaning

"Yes, clean yer house, an' clean yer shed,
An' clean yer barn in ev'ry part;
But brush the cobwebs from yer head
An' sweep the snowbanks from your heart.
Yes, when spring cleanin' comes aroun'
Bring forth the duster an' the broom,
But rake yer foggy notions down,
An' sweep yer dusty soul of gloom."

It never had occurred to me until I saw that little poem that there is something soul-purifying about the spring clean-up but now I know that there is. I do feel more warmly toward my neighbors and toward the world, I believe, when, after the last bit of trash has been hauled away and the last shine has been put on floors and windows in the house, I creep wearily into a bed that has been washed and sunned and aired until it is steeped in such perfume as only sun and fresh air can give.

Practically all cities now have their annual spring cleaning and beginning in April, say, or even earlier in the warmer places the daily papers carry notices to the effect that the cleaners will begin work in a certain ward on a certain day. Then what a bustling takes place in that ward! Lawns are raked, tin cans are collected, ashes are shoveled out—all the rubbish and leavings of winter are taken out and dumped along the edge of the street where the clean-up men will see them. All this is taken away and disposed of free of charge because the city officers realize the value of the work. It increases the health of the people and it stirs their ambitions.

So it is on the farm. One day the mother decides to clean out a cupboard. It looks so fine that she decides to wash the windows and presently the infection has spread in every direction. Out fly the children with rakes to clean up the front yard. Father catches the disease and thinks he had better lop off the old dead limbs around the house. The team is hitched to the wagon and off go several loads of trash to fill in the washed-out place in the lower forty. Everything burnable is saved for a big celebration bonfire with the neighbors driving over some evening after early supper and I'll guarantee that there are a few things the children will remember longer than those glorious bonfires with their spooky shadows dancing around and their parents warning them every minute to "watch out! Keep away from the fire."

Then mother decides next day that everything looks too grand for "just the home folks" and she'll have the Ladies' Aid in. The enthusiasm spreads from that all over the community—every ladies' aider goes home determined not to be outdone in spring cleaning by the Joneses and the first thing you know the city banker drives past and says to himself, "These fellows must be pretty prosperous around here—fences all up, places clean, houses spick and span. If they ever need a loan I guess I could afford to take a chance on them." (Only of course I hope you'll never need a loan.)

Just plain cleanliness is awfully

worth while. If you can afford to throw away a few old things and get some new ones, so much the better but if you can't, the spring clean-up will give a newer look even to the old things.—LUCY THOMPSON.

Ginghams for Summer

Don't forget ginghams when you are searching your brain for something to make your own or your daughter's bedroom pretty this summer. It launders beautifully and you can get it in such a lively variety of colors that it makes one feel gay just to go shopping around for it.

I have always preferred the checked gingham and only a few days ago I saw a lovely room done in good-sized blue and white checks with a speck of black here and there that suited me exactly. You'll want to use your own ideas, of course, but I think you'll be sure to like the gingham as window drapes, bedspread, and chair covering. If the easy chair of the room is still in good condition you can use just a gingham cushion for the seat and pad for the back; if not, a coat of paint, bright red, soft green, yellow, or blue plus the cushions will fix it nicely. Or, you could make a cover that would go completely over it, cutting the pieces to fit each part carefully and finishing it off with a little pleated skirt-like frill around the bottom. The same sort of frill around almost any kind of table or box makes an attractive dressing table when you hang a mirror over it.

It's always a temptation to put a little fixing on everything but a bright colored decoration—such as gingham is—can very quickly be overdone and it is better to select a piece with no design, or only a small one, if you intend to use much of it. Other uses of gingham that would enable you to carry out a color scheme in your room are slip covers for dresses on hangers, window seat cushions, and protectors for the ends of comforters and blankets.—LUCY THOMPSON.

Spring Fever

If modern science had done nothing else, it would almost have justified its existence by having given the death stroke to "spring remedies." Thanks to science, we know now that spring fever is nothing more than a natural call of the body for a change of scene and no disease that calls for a concoction like sassafras tea or sulphur and molasses for its cure. When the warm, langourous days come, what we want more than anything else is to get out into the air and sunshine. I'll admit that when most of us get there all we want to do is "jest set" but why not when we have been cooped indoors so long?

Most of us eat a heavy diet all winter and when Nature changes into spring and we no longer need to generate so much heat, the best spring tonic we can take is the reduction of our diet to something that includes plenty of fresh vegetables and fruits.

Just about the time the sassafras bark began to appear in the drug store windows, my mother used to take a big basket and a knife and start out scouring the sunnier slopes for dandelion greens. These mixed with what we used to call "lamb's quarter" made as fine a dish as any spinach ever did and how we throve on it! It is one justification for the dandelion pest that it does furnish such a good spring tonic.

More vegetables and fruit in the diet and a little time taken off for idling and day dreaming in the sun will nearly always put the sticky tonic bottles to flight and make spring something to remember with pleasure rather than for its disagreeable dosing.—LUCY THOMPSON.

The Single Dish Meal

Housewives who grow tired of preparing several dishes for a meal are finding that a variation, not only in kitchen but for the family, comes from preparing one-dish meals which in themselves contain a properly balanced diet, according to Miss Marjorie L. Foster, nutrition specialist of the National Dairy Council's New England unit.

"From all countries of the world come delectable combinations which experience has proven satisfactory," says Miss Foster. "For such a dish try a Norwegian salad, cool and refreshing with eggs, red cabbage, celery, a pepper for piquancy, dates stuffed with cream cheese as a garnish. The glass of milk, graham bread, and butter complete the main part of the meal. The possibilities of the sandwich are legion—for when served cold or toasted and piping hot it can so easily contain the vegetable or fruit combinations, with the glass of milk or cup of chocolate as a good accompaniment.

"During winter days, a truly delightful dish—Italian spaghetti with tomatoes and cheese and other combinations too many for detail; the scalloped and cream dishes with meat, fish, vegetables, or eggs, garnished by sprigs of parsley, watercress, or lettuce leaves, or a hot cream soup with vegetables and a bay leaf if you will, are those which will appeal to every food-educated family."

Miss Foster refers to a recent comment by Dr. E. V. McCollum, world-wide authority on nutrition, who says, "The safest guide to satisfactory nutrition, as to other matters relating to human welfare, is experience." Miss Foster adds that many women of her acquaintance, especially in the food demonstrations in Boston, from their own experience can make highly appetizing one-dish meals by not only referring to their favorite cook book, but working up their own combinations.

"So, to all with large and active families, to those who would use more time for rest, creative work, bridge, or golf, or to the tired business women who prefer to plan and prepare some of the easier meals complete in themselves, we introduce that aid to a good disposition—the satisfactory one-dish meal. Make sure that you add to every meal the three protective foods—fruits, vegetables, and milk in some form—and you will always be safe in making your simple meals nourishing and adequate, while they are prepared with a minimum of time and energy."

Nut and Cheese Relish

¼ pound cream cheese
1 teaspoon chopped parsley
2 tablespoons whipped cream
Salt and red pepper
1 cup chopped nut meats

Mix with the cream the cheese, nuts, parsley, and seasonings. Roll into balls, serve cold. Garnish with parsley and chopped nuts.—Household Nutrition.

"Don't mumble your prayers, Helen. I can't hear a word you say."

The *Salt* you feed

means better-producing animals if the salt is right

FROM the standpoint of efficiency, if nothing else, it is well that you consider the salt you feed your cattle. For cows that are fed with the right salt yield a greater return.

Stockraisers and farmers whose livelihood depends in a large measure upon efficient, productive animals, find that Diamond Crystal Salt is ideal for feeding. It helps to assure sleek, well-conditioned cattle, horses, sheep and hogs, which in turn means better producers.

Furthermore, you will experience no difficulty feeding Diamond Crystal to your stock. They take to it naturally because of its mild, pleasant taste.

There is a Diamond Crystal Salt for every farm use—for livestock, for table and for cooking, for canning, for curing meats, for butter and cheese-making. Ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

Regulation of Rates and Railway Service

Railway rates are subject to government regulation, while prices of most commodities are fixed by supply and demand.

Persons in an increasing number of industries are disposed to ask for regulation of rates especially to help them. Some who travel much seek abolition of the passenger "surcharge" for extra service in sleeping and parlor cars. Members of the miners' union have petitioned for lower rates on union than non-union coal to offset the difference in prices caused by the higher wages paid in union mines.

The price of grapes, having been depressed by a great increase in their production, the growers, in some territories, are, for this reason, seeking reductions in grape rates. It has been claimed that reductions in rates on other farm products should be made because of low prices.

Rates should be regulated in accordance with the rights and needs of both the railways and their patrons. Rates as a whole must be sufficient to enable the railways to earn a fair return, or they will become unable to render their present good service. Rates as a whole will not be sufficient if, for many kinds of service, they are made unremunerative because of price conditions for which the railways are in no way responsible.

Average railway rates in this country are the lowest in the world. If rates on particular commodities, or for long hauls, seem high, it is because the cost and value of the service rendered for them are high. Rates fixed regardless of the cost of transportation would cause a deterioration of service that would be disastrous to all railway patrons.

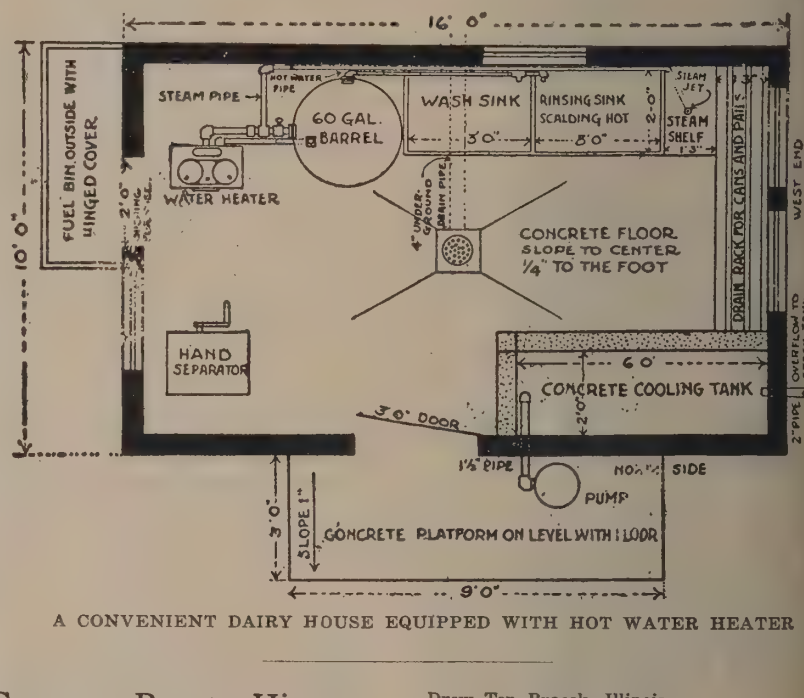
Hot Water and Steam for the Dairy

(Continued from page 553)

connected up with a barrel or tank in the same manner that the water back in a range is connected with the hot water tank and water system in the city home.

Types of Heaters



In our tests and demonstrations we have used both the coil heater and the jacketed heater. The coil heater heats a given amount of water a little more quickly than the jacketed type, but where a considerable quantity is to be heated, the latter is somewhat more economical in the use of fuel, as there is far less loss of heat through the walls of the heater.

Our tests and demonstrations show that either type of heater, when properly connected, furnishes plenty of steam for steaming the cans, pails, etc., in a small dairy, in addition to an abundance of hot water. However, if a large amount of steam is needed for sterilizing a large number of cans, bottles, etc., a steam feed cooker or a small upright boiler should installed.

The Dairy House

A convenient dairy house helps take the drudgery out of dairyin It need not be expensive or elabora but should be conveniently arrange well lighted, and sanitary. Amp provision should be made for plen of pure water, both hot and cold.

Note the arrangement the acco panying plan has for washing, rin ing, and steaming and sunning t utensils, and how they are work around in the most convenient ma ner from the wash sink to the dra rack in the successive steps in the proper cleaning. The cooling ta and drain rack are near the outsi door, making it convenient to load t cream into the wagon or truck and remove the cans and pails at milkin time. The drain rack should be on level with the steaming shelf a should be located so as to receive much direct sunlight as possible. T cooling tank should be on the nor side of the house.

A CONVENIENT DAIRY HOUSE EQUIPPED WITH HOT WATER HEATER

Sawyer—Brant—Hinman Guernsey Sale

The Guernsey sale held at Fond du Lac, Wis., April 28, under the management of Charles L. Hill & Son, included a consignment of 20 bulls from Brant Rancho, California, the complete herd of E. P. Sawyer, and consignments from the herds of A. H. Hinman, J. Heft & Son, and L. W. Mills. A total of 66 head was offered. The crowd was good but the bidding was slow and the prices but fair. The entire lot brought an average of $182; the 20 California bulls averaged $228; the 27 head owned by Sawyer brought $4,770; and those consigned by Hinman, Heft, and Mills an average of $141.

Just two animals went to $600, a cow from the Sawyer herd and one of the Brant bulls. The latter, a 16-month-old double grandson of Brookmead's White Face out of the class leader, Clarabelle of the Rancho, was purchased by W. L. Cowan & Son and N. J. Moon, Jr., of Wisconsin, for $610. Drew Ten Broeck of Illinois took the top cow, Florence of Waldwic, a typy 3-year-old granddaughter of Langwater Royal 4th for $600.

Benjamin & Pohlman did the selling.

Following is a list of the animals selling for $175 or more and buyers:

Wm. Basse, Wisconsin	
Royal of Maple Hill	$350
Geo. McKerrow & Sons Co., Wisconsin	
Pergue's Charmante	$230
Drew Ten Broeck, Illinois	
Florence of Waldwic	$60
Albert Marken, Wisconsin	
Gertie of Waldwic	$20
E. H. Fahrney, Wisconsin	
Faith of Waldwic	$20
Fancy Girl of Waldwic	30
N. J. Moon, Jr., Wisconsin	
Dimple of Waldwic	$20
Derby Oil Company, Kansas	
Ogawawa Martin 3d	$20
F. J. Rueping, Wisconsin	
Yvonne Martin of Goldenrod Meadows	$20
Richard Klemm, Wisconsin	
Corium Dreamy Eyes Catherine	$23
Anton O. Berge, Wisconsin	
Royal Leader of the Rancho	$27
W. L. Cowan & Son, N. J. Moon, Jr., Wisconsin	
Clarabelle's Royal of the Rancho	$61
Fred Burhop, Wisconsin	
Beauty's White Face of The Rancho	$18
Dr. J. M. Evans, Indiana	
Mixter Fireman of The Rancho	$22
Fred Sy, Wisconsin	
Musetta's Royal of The Rancho	$30
R. B. Webb, Minnesota	
Ula's Royal of The Rancho	22
H. H. & W. C. Bergen, Wisconsin	
Jennie of The Rancho's Admiral	$21
Armie Voigt, Wisconsin	
Melissa's Royal of The Rancho	$21
S. & E. Trevethan, Wisconsin	
Mellie Dale's Freedom of The Rancho	$17
F. F. Thielke & Son, Wisconsin	
Juanita May's Coronation	$21
R. E. Collier, Wisconsin	
King's Beauty of The Rancho	$19
Krause & Tinkham, Wisconsin	
Sunkist's Coronation of The Rancho	$18
Selsing Bros. & Martin, Selsing & J. B. Johnson, Wisconsin	
Betty 2D's Royal of The Rancho	$26
H. R. Talverson, Wisconsin	
Valentine's Royal of The Rancho	$20
O. E. Stoeffer, Illinois	
Ruby Rose King of The Rancho	$19
Albert Huss, Wisconsin	
Helen's Roseboy of The Rancho	$25
C. W. Greenfield, Illinois	
Red Rose's Stockdale of The Rancho	$22

The Signal of the Silo

(Continued from page 552)

eriment station in regard to most table type of silo for the local con- ons.

here are instances where it will be ter and cheaper for the farmer to struct his own silo, but in the l established dairy sections the e is past for cheap construction temporary buildings. The log in, the small frame house, and the type of barn all have their time their place, but the era has come, s coming, in the prosperous dairy munities when we must have e regard for asthetics and the nities of life on the farm. Make- t buildings do not satisfy. We ld provide for permanency and dings that beautify our farm- ds. This applies to the silo, as it to the farm home, the barn, and farmstead as a whole.

Cost of Filling Silos

he yield of silage per acre will be ut one ton for each five bushels. other words, it is generally esti- ed that an acre of corn that will luce 40 bushels of corn per acre yield about 8 tons of silage. A venient method of estimating the ie of silage is to compare it with on the basis of three tons of si- being equal in feeding value to ton of hay. If hay in the mow is th $15 a ton, silage in the silo ld be valued at $5.00 a ton.

vestigations recently made on 282 cal Wisconsin farms showed the of filling silos ranged from $1.02 4.50 per ton, the average cost be- $2.06 per ton. Approximately one- th of the farms had costs greater $2.50 per ton, while an equal ber averaged less than $1.75 per The factors most directly re- sible for this variation in costs the silo and machinery costs and relation to the size of the silo the length of time the machinery sed.

ie following table gives the aver- cost of filling silos on these 282 s in Southeast Wisconsin:

	Cost per ton	% of total costs
depreciation and repairs	$0.22	10.6
e, depreciation and repairs	.17	8.2
cutter, depreciation and re- rs	.18	8.8
binder	0.10	4.9
ns	.01	.5
labor, 1.83 hours at 3.17 cents	.58	28.1
labor, 2.57 hours at 13.6 cents	.35	17.0
at 12 cents per pound	.07	3.4
	.07	3.4
st on silo and equipment	.31	15.1
al cost per ton	$2.06	100.0

1 80-ton silo in this Wisconsin ey was filled at a cost of $1.54 on. A 16-inch cutter driven by a rse power steam engine was . Ten acres of corn were used, the haul averaged 90 rods. The consisted of 13 men. One man three horses cut the 10 acres of in 14 hours. Eight men and ns hauled corn for seven hours and no extra pitchers were used. men operated the engine and r and two others tramped silage. ok six hours to fill the silo. There an average per ton of 1.05 hours an labor and 1.94 hours of horse . A 150-ton silo was filled from res by a crew of eleven men at a of $1.18 per ton. Two less teams used for hauling than in the ous case, the other division of being the same. A 14-inch cut- nd a gas engine were used. The ge per ton was 1.06 hours of labor and 1.68 hours of horse

Minnesota investigation showed following costs of growing an acre of corn for silage: Sixteen hours of man labor and 35 hours of horse labor, which at costs given in the above table would total $8.83. To this may be added $5.00 for land rental, $2.20 for machinery costs, and $1.50 for sundry expense. This would make a total of $17.53 per acre prior to harvest, or $1.75 per ton if the yield is 10 tons per acre. This, added to the filling cost of $2.06 per ton, makes the total cost of silage in the silo $3.81 per ton. Silage is a cheap feed as well as an indispensable feed.

The Machinery to Use

Having decided to build and having built the silo, the next question of importance to consider is the machinery with which to fill it. We are already provided with the corn harvester, but unless there is a silo filler and engine in the neighborhood, we will have to buy one.

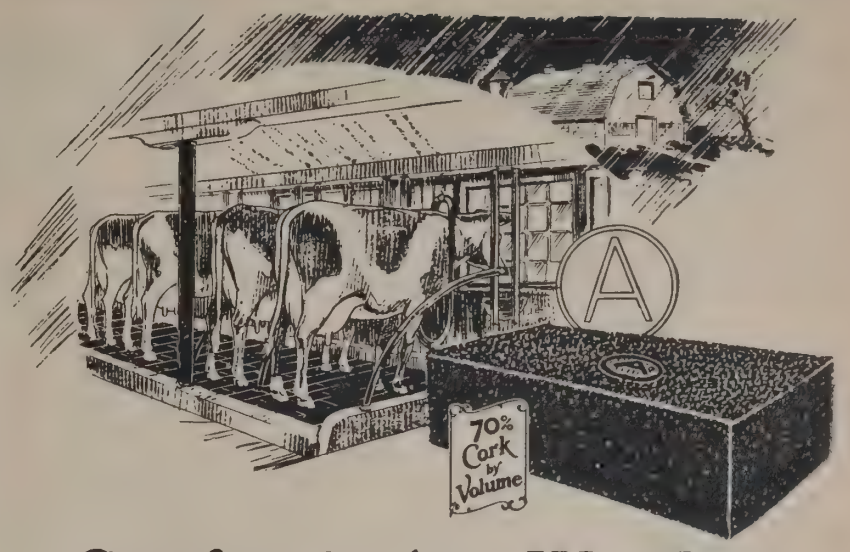
The present tendency is away from the larger outfit, and possibly the most economical method, for the man with 20 to 30 cows or less is to join with three or four neighbors in the purchase of the necessary equipment and in exchanging work at silo filling time.

A number of satisfactory silage cutters are on the market. The chief features to be considered in a cutter are that it is strongly made and will cut fine. The Wisconsin Agricultural Experiment Station advises against the use of sizes larger than the 16-inch fly wheel and the 18 to 20-inch cylinder types, because they are seldom operated to capacity and are wasteful of power. Ordinarily it is better to compare capacity by the total throat area when the machine is wide open and by the number of cuts per minute. The total throat area is the height of the roller lift multiplied by the width of the throat at its narrowest point. The engine should have sufficient power to operate the cutter and blower to capacity.

A new method of silo filling has recently come into use. It consists of a combined corn binder and silage cutter. The cut corn is elevated into a wagon box drawn alongside the cutter in the field. This is then hauled to the silo and pushed off into a blower which elevates it into the silo. The first cost of the machine is greater, but this is largely offset by the saving in man labor.

Write the manufacturers of these supplies who advertise, give them the number of silos to be filled and their size, ask them as to their recommendations as to the best outfit to meet your particular need, and then make a decision giving due regard to quality as well as to price.

Southwest Wisconsin Guernsey Sale



Guernsey breeders of Southwestern Wisconsin held a successful consignment sale at Livingston, Wis., May 4. The cattle were good and buyers from Illinois, Iowa, and Wisconsin were willing to pay very fair prices for them.

Forty grade cows and heifers 2 to 11 years old (2 were 11-year-old cows) brought $6,115, an average of $152.85. Four of the grades went for $200 or more; one to $207.50. Three of these tops as well as three others went to W. C. Turner, Wisconsin.

The 36 registered Guernseys averaged $183.75, 9 bulls averaged $201, and 27 females averaged $178.

Thompson and Bishop did the selling and Chas. Wilkins managed the sale.

Averages for females of the various ages are as follows: Eleven females under 2 years averaged $155; 2 two-year-olds, $134; 3 three-year-olds, $168; 11 cows 4 years or over, $211.

Comfort in Any Weather

IN Spring's uncertain weather, one of our best safeguards against the disorders that result from chill and dampness is a stall floor of Circle A Cork Brick.

Seventy percent cork (by volume) makes Circle A Cork Brick a warm, comfortable floor. Cork is an insulator and keeps out the ground chill. It is resilient and makes a floor that is easy on the feet and joints. And it is a nonslippery material that saves many a dangerous fall and strain.

In the small barn or the big one, it is good business to protect your investment in cows with warm, dry, comfortable floors of Circle A Cork Brick.

Write for a sample brick and descriptive book, "Circle A Cork Brick." ARMSTRONG CORK & INSULATION COMPANY, (*Division of Armstrong Cork Company*), 112 Twenty-fourth Street, Pittsburgh, Pa.

Circle A Cork Brick Floors

For Dairy Barns and Hog Houses

Ayrshire Breeders' Association to Meet

The fifty-second annual meeting of the Ayrshire Breeders' Association will be held June 8 at Hotel Kimball, Springfield, Mass. In addition to the election of officers and the regular business session, an automobile trip to Alta Crest Farms of Arthur H. Sagendorf, Spencer, Mass., is planned for the afternoon.

The evening session will be given over to a banquet at the Kimball Hotel in Springfield.

On the day following the annual meeting, a sale of 60 head of choice cattle will be held on the grounds of the Eastern States Exposition at Springfield under the management of the Ayrshire Cattle Breeders' Association of New England, with Walter E. Brigham in charge.—Ayrshire Breeders' Association.

Milk Consumption Increases

Continued increase in the per capita consumption of milk and cream in the United States during the past year is reported by the Bureau of Agricultural Economics of the United States Department of Agriculture, which places per capita consumption at 55.3 gallons for 1926, against 54.75 gallons in 1925, and 43 gallons in 1920.

The figures are based upon a survey of 373 cities having a total population of about 39,000,000 people, supplemented by reports from many of the large milk distributors and from co-operative milk producers associations. Each of these sources reported increased consumption, although a few firms reported a slight decrease.

Total consumption of milk and cream for last year is placed at 56,417,000,000 pounds, against 54,325,776,000 pounds in 1925. Practically all the large cities in the country show increased per capita consumption of milk and cream, the large dealers reporting an increase in sales of about 8.5 per cent over sales in 1925.

The report shows the daily per capita consumption of milk and cream on farms was 1.47 pints last year, and in cities the consumption was .967 pint per capita. Daily per capita consumption of milk and cream in cities in 1925 was .951 pint.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

The Origin, History, and Use of the 4-H Club Emblem

O. H. BENSON

WHILE principal of schools in Goldfield, Iowa, in 1904, I stopped one morning at the post office and secured my copy of the Register Leader, a daily paper published at Des Moines, Iowa. Up-

O. H. BENSON

Mr. Benson, now director of the department of rural scouting, Boy Scouts of America, was one of the founders of 4-H Club Work. While county superintendent in Wright County, Iowa, he organized clubs in the rural schools, holding annual exhibits. In 1906 he devised the clover emblem for his clubs. Later this was adopted as the national 4-H Club emblem.

on its front page I read—"Cecil Rhodes, the Diamond King, Dead." I read the article and the very interesting story of the life of this great diamond king and the report of his last will and testament, and how he had provided for a scholarship fund of $4,500 to be awarded to college students—one for each state and nation, the award to be made on a 4-point basis of educational, fellowship, physical, and moral development—every applicant to compete with other aspirants for the award on the following score card; first, pass an examination of intelligence based upon school and college requirements covering high school and regular college work; second, pass a physical examination, based upon his daily training in health and physical fitness; third, pass the tests and requirements in character building and moral fitness to represent his state; and, fourth, pass a competitive test for "good fellowship" with faculty and student body. In other words, he must have definite qualities of co-operation—"give and take"—and must show citizenship strength as a result of his educational advantage.

4-H Idea and the Diamond King

These pronouncements of educational fitness inspired me to read the Register Leader article to the high school students at our regular morning exercises with comment about as follows:

"Young people, my only regret this morning is that I can not, because of age and post graduate standing, qualify for this Cecil Rhodes scholarship and since I can not win it, I am anxious that some boy in our Goldfield high school win it and this chance to spend three years at Oxford University, England, and be a part of this great school of international good will and brotherhood."

Then I looked over the student body and noticed a boy, William Ziegler, by name, leaning forward with apparent interest in the challenge. Raising my hand and pointing in the direction of "Bill" Ziegler, I shook a finger of challenge at him and said, "Bill, why not you? I'll dare you to start now and go after this coveted prize on this 4-point basis, will you?" He nodded assent, spent three years in high school, then four years in college and was the outstanding candidate and winner of the Cecil Rhodes scholarship following his graduation. In my work in the schools ever afterwards, I endeavored to plan more definitely than ever before all my educational programs on the 4-point or 4-H basis and I believe, because of this, was able to be of far more service to youth, school, and the community than if I had confined my efforts to the 3 R's or purely academic program of education.

Educational Survey—Wright County

While County Superintendent of Schools of Wright County, Iowa, I became greatly interested in President Roosevelt's Country Life Commission and its work. I read with great interest the magazine, farm journal, and press reports of this Commission. The questions continually asked at that time were:

1. Why the decadent country life?
2. Why are farm young people so keen about leaving the farm for city jobs?
3. Why is tenant farming increasing so rapidly all over the nation?
4. What will be the inevitable outcome if present tendencies persist?

AGRICULTURAL PROJECTS IN A WRIGHT COUNTY, IOWA, RURAL SCHOOL, 1908

Mr. Benson was one of the first to develop project work in the teaching of agriculture in rural schools. This picture was taken some 19 years ago of a Wright County, Iowa, rural class in agriculture, their teacher, and exhibits of booklets, sewing, rope work, bird houses, etc.

The above questions were to m live issues, and revealed condit with which I was familiar.

I resolved to make a careful vey of conditions in Wright Co and its schools, to ascertain thro teachers and students the real f bearing upon these questions.

Investigations, made by way of dent surveys, revealed the follo startling facts:

1. Ninety-one cent of the f boys said they going to leave farm, and g many interes reasons for th decision.

2. Eighty-se per cent of the g stated they w have nothing to with the farm rural home wh they became wor

3. Eighty-six cent of all fa youth questio stated that t were more or ashamed of th farm connecti and of their f er's business a they felt that success in life me for them some city job, profession contact.

4. Nothing was being done schools, parents, or public to dign farming and to sell to farm yo the best things of rural life. On contrary, teachers, preachers, p ents, politicians, and editors seemed possessed with the idea advertising the hardships, long hou

THE BIRTHPLACE OF THE 4-H CLUB EMBLEM

During recess on a bright June morning 21 years ago, while the eleven pupils of this Iowa country school were out in a sunlit clover field hunting 4-leaf clovers, Mr. Benson, the county superintendent, drove up. At the teacher's suggestion they made a bouquet of their seven 4-leaf clovers and gave it to him. "The teacher rang the bell and the pupils took their seats," recalls Mr. Benson. "I followed, bearing with me the handful of good luck. Just before closing for the noon hour the teacher asked me if I didn't have a message for the school. Holding my bouquet up before them I told them I had been looking for an emblem for the agricultural clubs and the schools of the county and they had given it to me. So out of the hearts, hands, and needs of these farm children was born this significant 4-H emblem which bears so effectively for old and young the message of a 4-square education."

l profits, and "hayseed" ideas of
ı life.
ıe above conditions indicating a
ıite need of a better functioning
ur schools and backed by my own
ı in country life and farming led
ıe definite planning of programs
activities both in and out of
ol to remedy these conditions.
ediately, with the co-operation
whole-hearted support of teach-
and board of supervisors, I be-
the following activities:
rst: I developed a system of cor-
ion in which through booklet
, exhibits, and subject matter
nes, I showed the teacher how to
late every subject of the class-
ı with the work of farm and
. Instead of asking the chil-
to write about things in distant
s and subjects of which they
nothing, they were led to ex-
by way of adventure, contest,
and schoolroom inspiration all
interesting things of farm ani-
, crops, and soil.
cond: In order to link properly
life with school life, 4-H Clubs
organized, based upon the stu-
s interest in the farm project or
prise. Boys became members of
clubs, corn clubs, pig clubs,
ry clubs, and garden clubs, and
irls joined clubs that had to do
poultry raising, gardening, can-
bread baking, and millinery.
e organizing these clubs and
ng them up with the schools and
life, I was in quest of a suita-
membership badge and achieve-
emblem to be used in the work.
t continually thinking about the
Rhodes four-point standard of
ation and at the same time about
pparent need of our farm popu-
ı in regard to symmetry in their
ation.
ird: We introduced into every
l of the county agriculture and
economics by way of classroom
extbook work and correlated the
ook work in the subjects with
agricultural club work through-
he county.
urth: We conducted rural com-
ty and township picnics, autumn
, short courses, play festivals,
n general a greater brotherhood
community spirit amongst the
e.
ese above four educational ef-
were definitely planned and exe-
l with a view to meeting the
ational needs of the county and
s all handled by the county su-
tendent and his assistants before
ay of county agent, club leader,
ome demonstration agent.

e Four-leaf Clover Bouquet

ile driving through the county
hool supervision work in June,
I came to a country school dur-
the morning recess period. I
l the school teacher and her
of eleven children out in a clo-
ield hunting for 4-leaf clovers.
I approached them both teacher
pupils started out to meet me
ng with them their good luck
ms. The teacher turned to the
en and said, "We have found
ood luck clovers. What do you
Let's give our county super-
dent a bouquet of good luck."
this invitation, they all surren-
their 4-leaf clovers and placed
into my hands—seven perfect
clovers.
e teacher rang the school bell
the pupils took their seats. I
ved into the school room bearing
me the handful of good luck.
before closing the half-day ses-
for the noon-day period, the
er asked me if I did not have a
ge for the school. With my
luck bouquet in one hand, watch
e other, I took my position in
of the children.
this little speech I outlined for the first time the 4-H emblem and its good luck story. I told them I had been looking for an emblem for the agricultural clubs and the schools of the county and that they had given it to me.

So out of the hearts, hands, and needs of these farm children was born this significant 4-H emblem which bears, so effectively, for old and young, the message of a 4-square education.

Designing the Emblems

On the following morning in the office of the county superintendent of schools, three emblems were sketched or designed. One was the three-leaf clover with an H on each leaf, symbolical of the trinity of powers in education, the equal training of the head, heart, and hand. This was to be the membership badge for every boy and girl member of the Wright County Agricultural and Homemaking Clubs.

The second design made was of the 4-leaf clover upon which were printed the 4-H's. This emblem was to be awarded to every boy and girl who finished their year's work and it was to be the emblem of good luck, the insignia of real achievement.

No one could wear this good luck emblem who had not entered the game and finished the year's club work as outlined.

The third emblem designed was the 5-point star with an H on each point. This was awarded to the club member who made the highest record of the entire school community. The 5th H stands for "hustle," the thing, of course, a member must do to win.

Those who labored with the schools of the county and some of the noted visitors will doubtless remember seeing the 4-H club emblem drawn in design on school exhibits, used on our county school letterheads and worked out in various ways on our many industrial exhibits. Club banners, pennants, and medallions also had the 4-H club imprint upon them.

[To be concluded]

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue. Let's talk it over.]

The May 10th issue is our building number—the farm home, the dairy barn, ventilation, the dairy farmstead, tools, and their care, are some of the topics discussed.

What should be done before building? Investigate other buildings in the neighborhood and study various bulletins and circulars on the building project. Build on paper first. (See page 506.)

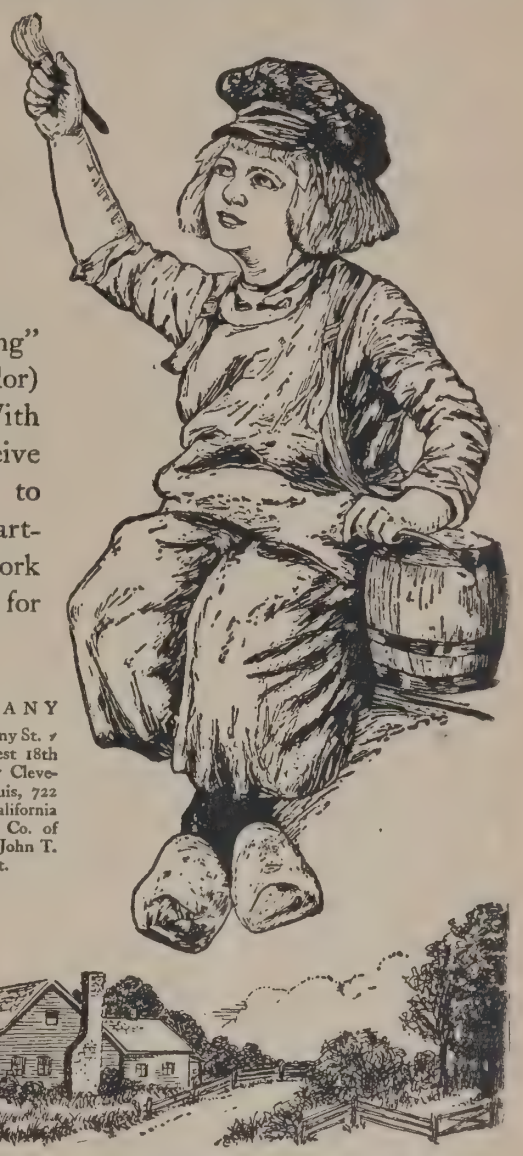
Where should the farm house be located? It should be given the most important part of the farmstead. It is desirable that it be high enough so that there can be drainage from the basement. The farmstead as a whole should be given careful consideration so that there will be suitable space for buildings that may be erected later.

Why should a good barn have a substantial foundation? Because if it is skimped and carelessly put in the walls will settle and crack. Usually two to two and a half feet is sufficiently deep. It should never be placed upon loose or refilled ground. (See page 496.)

What materials are used for foundations below the ground? Concrete and stone. A good mixture for concrete is 1:2½:5, meaning one part Portland cement, two and one-half parts sand, and five parts broken stone or coarse gravel.

What are the requirements for a barn wall? That it be so constructed as to be warm and durable, conserve the stable heat and keep out the cold. For best results the walls should be insulated.

How much window space should be provided? Sunlight is a powerful disinfectant. Provide not less than four square feet of glass for each full grown animal and make the windows as long as practical up and down.



What does good ventilation do? It provides pure, fresh air which is necessary for the health and comfort of the cows; it removes foul air; it keeps the stable dry preventing rust, rot, and mold; it provides a measure of disease control. (See page 497.)

What is the King system of ventilation? The principle of ventilation as outlined by Professor King at the University of Wisconsin. The fresh air comes in at the ceiling and the foul air is removed at the floor. The modified King system retains the intakes at the ceiling and removes the foul air from the ceiling the same as does the Rutherford system used largely in Canada.

Should late winter calves be pastured? No, successful dairymen do not put them on pasture at all the first summer. They continue them on grain, hay, and skimmilk, giving them an opportunity for exercise and direct sunshine in a yard near the barn. (See page 514.)

Beauty comes to your house with paint. Beauty *stays* with lead paint made of Dutch Boy white-lead.

WHAT to do and how to do it? These questions puzzle many house-owners when the time comes to redecorate the home, either inside or out. For the answer to such questions, send for the "Handbook on Painting" and the booklet (in color) "Decorating the Home." With the booklets you will receive a decorators' data form to use if you want our Department of Decoration to work up a special color scheme for your particular house.

Advertising in this department is 8c per word. Remit in advance.

HELP WANTED

Dairy Farmer Wanted—For many years I exerted every effort in building a profitable dairy farm. Circumstances arose that took me away from farm and I have been operating same for past 15 years with hired labor. Buildings have gotten dilapidated and conditions are much different from what I would like. I wish to interest a man and wife who aspire to own a farm home and will make the sacrifices required to obtain this object. Not one in a thousand has the grit and determination to perserve till they climb the hills of difficulty that they will encounter; who take more delight in owning sleek calves than in a new, shiny car; or enjoy reading dairy literature more than the Sunday comics; or would rather visit the State Dairy Farm than go to a circus. After a trial on both sides, I will try to make a partnership with a suitable couple by which they could have a half interest in a 270 acre farm. (Farm now has 30 head of Jerseys, other stock and equipment.) A deal with the idea that some day it will all be theirs that will encourage better buildings, terracing, adding permanent improvements, etc. I have no rich man's play place, so do not waste your time nor mine if you are looking for easy money. S. H. PILE, Glasgow, Mo.

Wanted—Farm Manager for American-owned dairy farm near Havana, Cuba. Working farm manager or assistant herdsman. ried, lifetime experience. J. M. V., Box 59, land, Wis.

Comparing White and Yellow Corn for Pigs

he Illinois Experiment Station re-
ts the results of an experimental
ling trial comparing white and
ow corn for growing and fatten-
hogs and for brood sows. A sum-
y of the work follows:
; was found that sows raised on
mal rations could be carried
ugh two gestation and suckling
ods on a ration of white corn,
te corn bran, and tankage without
lent effect on the number of pigs
owed or weaned or upon the
wth of the pigs during the suck-
period. The continued feeding of
ration, however, resulted in seri-
impairment of the reproductive
ers of one sow, her third and
rth litters being farrowed dead.
h the addition of 1 per cent of cod
r oil to the ration during the fifth
ation, this sow farrowed a litter
ormal pigs.
ormal weanling pigs which were
owed by sows carried through
r gestation periods on white corn
ons were continued on a ration of
te corn and tankage. They failed
thrive and ultimately developed
ological symptoms and died. Pigs
owed by sows not on experiment
raised on normal rations to 60 or
pounds were eventually handi-
ped by white corn feeding al-
igh they made normal gains for
ral weeks. At weights of 175 to
pounds they developed character-
: symptoms of white corn feeding
finished poorly.
mall amounts of alfalfa meal (a
e more than an ounce a head
y) proved entirely effective in
ecting the deficiencies of a ration
white corn and tankage fed pigs
le growing and fattening from
ghts of 60 to 227 pounds.
pparently it was a lack of vita-
A that caused the unfortunate
ults when sows and pigs were con-
ed on the white corn ration for
long a time, for when that factor
supplied by adding small
unts of alfalfa meal or cod liver
the pigs developed normally and
sows farrowed normal litters.
ile white corn may be deficient in
min D as well as vitamin A, it is
sidered improbable that such a de-
ncy could have affected the re-
s, since sunshine apparently re-
es the necessity for that vitamin
he feed, and all the pigs in these
eriments were confined to open
lots, allowing as great exposure
direct sunlight as the weather
ld permit.

n Litters in United States

ccording to a report from the U.
Department of Agriculture, swine
lucers in 29 states succeeded in
ging 808 litters of pigs up to or
ve the required 2,000 lbs. in 180
s to qualify for ton litters in 1926.
total number of litters entered
2,636, more than two-thirds of which failed to qualify for various reasons.

Tennessee qualified 121 litters with an average weight of 2,472 lbs., the heaviest of which was 3,672 lbs. Pennsylvania producers brought 114 litters up to an average weight of 2,300 lbs., with the heaviest litter tipping the scales at 3,158 lbs. Illinois came in third with 90 litters averaging 2,366 lbs., the heaviest one weighing 5,117 lbs. This was the heaviest litter produced. It consisted of 17 pigs that weighed 301 lbs. each at the end of 180 days. The second heaviest litter also consisted of 17 pigs, but weighed only 4,925 lbs. It came from Indiana where 80 litters qualified at an average weight of 2,319 lbs. Kentucky was in fifth place with 64 litters weighing 2,351 lbs. each.

The average number of pigs in ton litters was 10.4; in the heaviest litters from the several states it was 12.3 pigs. The average weight of the heaviest litters was 3,117 lbs. Only two litters reached or exceeded the two-ton mark. The average weight of 666 ton litters for which complete data are given was 2,345 lbs.

The ton litter project, having demonstrated the possibilities of good management in swine production, has caused producers and swine husbandrymen to apply similar methods to all the sows in the herd in an effort to increase the amount of live pork produced per sow bred.

Trucking Hogs to Market

What per cent of all hogs marketed at the ten principal midwest markets are transported to market by motor trucks? This question was the basis of a survey made recently by Armour's Live Stock Bureau.

Of the total hogs received at Indianapolis, Omaha, St. Joseph, St. Paul, Chicago, Kansas City, Sioux City, Louisville, Cincinnati, and Milwaukee in 1916, less than 5 per cent were carried to market by trucks. Of these markets, only two, Indianapolis and Louisville, received more than 5 per cent by trucks.

In 1926 only one market, Chicago, received less than 5 per cent of its hogs by trucks. Indianapolis received 42 per cent and Louisville nearly 45 per cent. At Sioux City where roads are not as well developed as at some of the markets farther east, nearly 35 per cent of the hogs received came in by trucks. In 1926 almost a million cattle, hogs, sheep, and calves came to the Omaha market in a similar manner.

Although the distance for trucking in hogs is increasing, the average distance from which a market gets most of its hogs in this way is a 50-mile radius.

The average number of 200-lb. hogs hauled in trucks of varying capacity was found to be 12 for one-ton trucks; 18 for the one-and-one-half-ton trucks, 25 for the two-ton trucks, 35 for the three-ton, and 40 to 50 for the three-ton, double-decked loads.

A close study of the prices received at the Indianapolis market during 1926 for hogs shipped by rail and those trucked in, shows an average advantage of 12½ cents a hundred in favor of the latter. This is thought to be explained on the basis that producers within trucking distance can follow the market more closely with quick deliveries.

Favors the McNary—Haugen Bill

HOARD'S DAIRYMAN:—In the March 25 issue of Hoard's Dairyman the editor invites those who favored the McNary—Haugen bill to show wherein the President's reasons for vetoing the bill are faulty. The editor's invitation is practically a challenge as he goes on in the editorial to discuss the subject in an attempt to prove that the President's reasons are sound.

The main trouble lies in the fact that any plan to be effective in getting results in a large way involves the point of control in marketing. It is this idea of control in marketing of which so many of the agricultural economists and farm paper editors seem to be so much afraid. And why this should be so is certainly beyond my comprehension. They seem to fail to realize that, for many years, there has been much control of the marketing of farm products, but the control has been on the buying side, or, at least, by the private concerns that handle farm products for the profit in handling. They also seem to fail to realize that the reason California citrus fruit growers have gotten better results in marketing than the producers of some other crops is because they have a larger control. The Land O' Lakes Creameries, Inc., is getting results because it has a large control. The New York dairymen appreciate the need of more unity in order to get a large control. The producers of wheat, corn, hogs, and some other crops have been worse off than producers of many other crops because they have less control. Of course, the larger the surplus over home consumption the harder it is to get control.

As I see it, the main purpose of the McNary—Haugen bill was to provide means of getting a larger control from the selling side. Legislation and a government agency is needed because farmers have failed to organize so as to handle the matter themselves.

To answer all of President Coolidge's arguments would require a long article; and, as the editor is strongly in favor of the President's stand, an article in opposition would require arguments radically opposed to the editor's views and he might consider them too radical to publish.

Both the President and the editor of Hoard's Dairyman stress the point that control of marketing can not give satisfactory results so long as there is no control of production. Many of us farmers have been convinced for a long time that regulation of production is one of the factors involved in the marketing problem. And the sooner the farmers' advisors and the farmers themselves are convinced that there will never be really effective regulation of production until there is control of marketing from the selling side, the better it will be for agriculture. Some few farmers may be influenced in their planting by statistical reports and advice of agricultural experts, but the majority of farmers have to be awakened to the requirements by more emphatic means. The way to stabilize prices is to keep the surplus off the American market. Then, if good prices tend to increase the surplus, the central sales agencies and the local organizations should be strong enough to work out ways and means of effective regulation of production.

Our whole agricultural educational policy, both in theory and practice, has been and, to some extent, is yet entirely opposed to the doctrine of controlled marketing and regulation of production. Up to six or seven years ago increased production was the whole slogan. And, even now, farmers are told over and over again that they can not organize to control marketing or to regulate production. It is our system of education that makes it so hard to get the farmers of this country together on their most important problems. In Denmark they teach co-operative marketing in the schools. In this country we do not teach it because it is a "controversial subject."

Now when a large number of farm leaders got together on a plan which they believed would be an effective step in the solution of the marketing problem, the President answers by a negative; but neither the President nor his advisors have suggested any positive step. This may not discourage progressive farmers and leaders, but it will tend to increase the number of farmers who say, "Oh, what's the use, we can't do anything."

As to the dairy farmers, it is easier to send a cow to the stockyards and cut down the number of heifers grown than to cut down the acres of land in crops. So long as dairy products are not among the export crops dairymen will sit pretty comparatively. But it may be well for the dairymen who opposed the McNary—Haugen bill to stop to consider what may happen to them when Arkansas, Missouri, the whole South, Southwestern Minnesota, Iowa, Nebraska, Kansas, North and South Dakota, etc., get to going strong on the dairy cow. Every influence and much of our educational effort is brought to bear to bring that about. Some of our large daily papers keep men in the field continually to induce farmers to go into dairying. The year 1924 showed us that it will not take so very much to put dairy products in the surplus group, also. It might be a good deal better for the dairy farmers if wheat growing and corn and hogs would be fairly remunerative so that farmers engaged in those lines would not switch to dairying altogether too fast.

I was exceedingly glad to see that President Glen Frank believes that "the solution of the farmer's problem will come just as soon as he takes into his own hands the distribution as well as the production of his products." Taking it into his own hands evidently means getting control. But when President Frank says: "Farmers will never succeed with any marketing scheme they aren't big enough to think out themselves," does he realize it has taken forty or fifty years of persistent and intensive educational work to bring about the modern improvements in farming such as the use of silos, the growing of alfalfa, and improvement of dairy herds? The general run of farmers just work. They do not think out anything. Practically all advancement comes through the work of progressive farm leaders, agricultural experts, educators, scientists, inventors, and experimenters.

The President should have said that farmers will not succeed with any marketing scheme that they have not agreed upon after making a thorough study of it. When marketing is taught as thoroughly and persistently as production is taught now, farmers will doubtless learn to handle that part of their business, also.

Minnesota. J. F. LARSON.

Poultry on the Dairy Farm

Rebuilding

Most of our effort is directed towards plans for a new poultry house with a total disregard for the building that may now be in use. A great many of the houses are properly situated, well constructed, and have sufficient insulation but do not seem to work properly. They may be warm enough but lack sufficient ventilation.

The first principle to consider in housing is the size of the house in respect to the number of fowls carried. About 4 square feet of floor space per bird is allowed with the heavier fowls and 3 square feet with the smaller ones. This rule is usually broken in that a flock owner has had better hatching results than was anticipated, has too many birds, and carries about 3 or 4 per square foot and wonders why the results are poor. Possibly a number larger than this can be carried but if this ratio is exceeded, it will be found that more time must be given to the management, cleaning and removal of litter will be required at shorter intervals, and a better caretaker is required.

A second problem that is usually encountered in an old house is due to previous misinformation. Many of the older houses are too narrow. A house 10, 12, or even 14 feet wide will need remodeling.

Width and Height

In most instances the error was carried as far as possible and the height of the house was also excessive. Most of the poultry houses were built for some future generation of giants. The six or seven feet height to a house is for our own convenience and not because the hens require that space. We are in fact putting a handicap on them in that an extreme height increases the cubic air capacity of the house and forces the flock to heat up that addition.

When a seven- or eight-foot front elevation has given to a twelve-foot shed roof house, it is possible to convert this over to a combination roof to advantage. A four-foot addition to the south side would give a 16-foot depth and about a 5½-foot south elevation. This would be about the minimum height and still obtain light at the rear of the house. With this roof construction one could either carry a straw pack or seal and pack with dry sawdust or planer shavings.

We all have our aversions and my pet one is the semi-monitor house for Wisconsin conditions. Its use may be advisable in some sections but it surely doesn't work here.

This question of housing is pretty much of a district or state problem that must be worked out within that area to best advantage. Stepping over the line too liberally is very apt to mean trouble. That is one reason why a house designed for southern conditions does not work in the northern states.

What Others Have Done

One man had a poultry house that had been designed in the early days for a small flock. As the size of the flock was increased he also tried to increase the size of the house. After three changes it finally became a semi-monitor, but did not work.

He was fortunate in that the break in the roof came in the center of th house. Instead of having the brea occur about six feet from the front an 18-ft. house, it was 9 feet bac There was a difference of about tw feet in the height of the north an south walls.

We raised the south roof in tw sections, built the south wall to th same height as the north, joined th two roofs and connected the buildin into a gable roof house. A false ce ing was then installed, doors cut each end of the gable, and a stra pack was made. The house as reju enated has been working satisfacto ily.

In another instance the chick coop and hog house were joined. fact the hog house formed an L the end and around the rear of th chicken coop. It was all under o gable roof.

This man wanted to increase h poultry interest and decrease t hogs. With a depth of 22 feet it w impossible to convert this buildi with anything other than a semi-mo itor. The roof was removed and n built with that idea in mind. The n sults in this house have not been ide in that frost collection is a proble even with the roof sealed, but is t best that can be done.

If the location of this house h been different it might have been po sible to leave the gable roof and i stall additional end windows. Con tions, location, and ease of changi must be considered in deciding wh is best to do.

A Wood Shed Used

One of the men in Rusk County h an old building with a gable roof th had been used as a wood shed. T construction was wonderful becau it was built back in the days wh lumber was lumber. This house w hauled around to a new location, n modeled, and made into a very sati factory coop.

Sometimes poor results come fro only partly doing the job. One ma had a remodeled house in which straw pack was installed. He crabb about it not working until we fou that he had only put a door in o end of the gable.

Another change that can often successfully made is in respect to t window space. Usually glass is i stalled at about the rate of 1 squa foot of glass to 10 square feet of flo space. Muslin or bafflers are allow at the rate of 1 square foot to 25 30 square feet of floor space.

Glass, Muslin, Ventilation

In many instances the amount glass either exceeds or falls below t correct amount. Too much gla means decided fluctuation in temper ture since glass both absorbs an gives off heat rapidly. This mea high temperature when the sun shin and low temperature at night.

Windows should be arranged height from about 2 feet from t sill to as close to the plate as po sible. This design distributes light the rear of the building. Windo must also be removable or hinged t and bottom or open door wise to pe mit direct sunlight.

Muslin or bafflers are advised b cause the pipe outlet will not ope

e under all conditions. The poultry use being low, is affected by cross rrents from the higher buildings. a pipe outlet system as now in-lled is operating it should not be anged. If, however, it acts like an ake rather than an outlet a change y be advisable.

In some instances insulating the e has been advised. It may be apped with some insulating ma-ial to maintain warmth and allow an air movement due to the dif-ence in temperature.

It is only the difference in temper-re that causes an exchange of air occur. If the temperature within d outside the house is the same re will be no air movement.

When the pipe outlet does not work e must depend on muslin or baffiers h windows opened for ventilation. ring the day one must depend up- adjusting the windows while the er openings act as a check at night ing a slower air diffusion.

Insulation Important

A double wall construction in the thern section is necessary. With able boards and paper between on outside and paper with shiplap eting on the inside, it is possible to the loss through the walls down 22%. This is just about as low as is feasible to go.

Talking building material is tread- on thin ice. There may be some ultry houses constructed of materi-other than wood that work cor-tly. It may be that I have just n unfortunate enough never to e seen one.

f one does happen to have a house lt of stone and stuck in a side hill, first thing to do is think of some other than a poultry house to ch it can be put. When a house lt of other materials must be used robably is possible to leave about " or 4" air space and then seal it inside with shiplap. This will bably help to some extent.

When a sun room is properly con-ered, it may be advisable. So much rt has been required in overcom-the old idea that hens require one n for laying, another for roosting, another for eating that we are a little afraid of back sliding.

The sun room has been advised e the value of direct sunlight has n realized. This shed is just a e covered shed with a tight roof three tight sides. A shed of this e is advised since the litter can kept dry and the hens are kept the cold ground. Considered in way, we can probably advise this addition to a small farm flock house. It is just a means of getting the hens into direct sunlight without the disadvantages formerly encountered.—J. B. HAYES.

It's a book that will help you look ir best during summer days. For your y send 10 cents today to Fashion De-tment, Hoard's Dairyman, Fort Atkin-, Wis.

Coccidiosis

Coccidiosis is one of the most destructive diseases of young chickens, for practically all established poultry farms are infected. The heaviest losses occur in chicks from four to eight weeks old. A large number of chicks partially recovered from the disease remain as "culls" and often cause greater loss than the mortality. Older birds may become affected with a chronic type, which is slowly fatal.

The disease is caused by the presence in the intestines of chicks of a microscopic parasite which develops and multiplies in the cells of the intestines. Usually the first indication of the presence of coccidiosis in a flock of chicks is droopiness of a few. The droppings of affected chicks frequently contain blood but this indication is not always present. The heaviest mortality usually occurs during the first week or ten days after the first droopiness appears.

How the Disease is Transmitted

The soil of yards in which infected chickens have been kept is the most common source of the infection. Brooder houses, feeding and watering vessels, hovers, and other accessories previously used for infected birds, when not properly cleaned, may be the source of infection. The infection may be carried from one yard to another or into brooder houses by attendants or by wild birds, dust laden wind, and so on.

Contrary to common belief, lack of suitable food for care, and improper housing conditions are not the cause of the disease, but they render the chickens more susceptible by lowering their natural resistance.

Control With Skimmilk

Careful experiments at the California Experiment Station show that the feeding of sufficient milk is of great value in controlling outbreaks of coccidiosis. This benefit appears to depend on two factors: Its property of producing acidity in the ceca and its ability to stimulate rapid growth. The production of acidity is due to milk sugar, and in order to maintain this acidity continuously a more or less continuous flow of milk sugar through the intestinal tract is necessary. This requires the feeding of a high percentage of skimmilk solids; 40 per cent dry skimmilk was used in the successful mash at California, and *less than this amount will not give satisfactory results.*

The ability of skimmilk to stimulate rapid growth of chicks gives increased resistance to diseases in general, including coccidiosis. So, while controlling coccidiosis, the control ration builds healthy, vigorous chicks with a rapid rate of growth.

The composition of the mash is not of great importance providing it contains a suitable mixture for feeding to young chickens and has at least 40 per cent of dry skimmilk. The mash used in the California experiment and with success on a number of poultry farms contains the following: Dry skimmilk, 40 pounds; wheat bran, 10 pounds; yellow cornmeal, 30 pounds; ground barley, 20 pounds.

Rules for Feeding

The following rules for feeding are indicated as the result of the California experiments:

1. Start feeding the mash as soon as the presence of the disease is determined.

2. Keep the mash constantly be-

FLOCKS BLOOD TESTED

Our Flocks of Pure 3red, High Quality, Heavy Laying Fowls are annually tested for BOTH WHITE DIARRHEA AND TUBERCULOSIS under University of Illinois supervision. 35,000 HENS UNDER TEST. LARGEST PLANT IN THE WORLD PRODUCING CHICKS FROM BLOOD TESTED FLOCKS ONLY.

Our Stock is selected especially for vigor and High Laying Qualities and Ancestry in both male and female. We will have ONE MILLION OF THESE CHICKS for our customers during 1927. We also give a SEVEN DAY GUARANTEE on our Chicks by replacing the loss at half price. We will allow BIG DISCOUNTS on Brooders.

fore the chicks in hoppers or troughs constructed so as to prevent waste.

3. Provide sufficient hoppers so that all chicks can eat freely.

4. Feed grain once or twice daily but restrict the amount to from one-third to one-half the weight of mash consumed.

5. Continue this system of mash and grain feeding as long as there is any indication of the disease. This usually requires from one to two weeks; the amount of skimmilk in the mash for the more vigorous birds can then be very gradually reduced and the ration changed until in from two to three weeks it is the same as the one in use before coccidiosis started. The change should not be made abruptly.

6. Feed greens as usual.

7. Provide sufficient watering vessels so that the chicks can drink freely. Keep the drinking vessels at least five feet from the mash hoppers.

8. Do not neglect sanitation.

Precautions

The 40 per cent dry skimmilk mash may result in unusually rapid growth. It is desirable to avoid the possibility of a setback when the ration is changed to the usual grain mixture. Therefore, the 40 per cent dry skimmilk mash is not recommended for continuous feeding longer than three or four weeks. The dry skimmilk should be reduced gradually and the permanent ration may to advantage contain 10 to 20 per cent dry skimmilk.

When chicks are fed liberally with skimmilk, either dry or liquid, the droppings become watery, causing the litter and floor to become wet. This makes frequent cleaning of the houses necessary to check development of the parasite. *When the floor does not become wet it indicates that the chicks are not consuming sufficient milk.*—Dry Milk Institute.

Hen Injured

Can you please give me some idea as to what was the matter with one of my Barred Rock hens? When I first noticed her I thought that she was "broken down" for she went about with her tail down, her abdomen bulged with fat. After being removed from the flock she became very inactive and developed a slight limp. One leg seemed swollen, otherwise she seemed bright and moved her head alertly.

After killing her, I examined the leg and found that there was a layer of fat under the skin; between this and the flesh was a layer of yellow, paper-like substance which seemed to be in folds, and a hard lump of the same substance directly over the first leg joint. It was very odorous. The flesh under this substance seemed blood shot. The rest of her body was normal except the liver which was a bright orange streaked with red. She has been one of my best layers. Do you think this condition could have been caused by an accident? Would the overfat condition have anything to do with it?

This is my first experience with chickens and I am afraid I have been rather lax in sticking to my feeding problem. I have been feeding the following ration (omitting the oats) per 25 hens: Wheat 3 lbs., oats 1 lb., sour milk 10 lbs., mash 1 lb., kale—all they will eat; plenty of grit and oyster shell. My chickens are too fat. How shall I go about dieting them? I will appreciate any suggestions which you can give me.

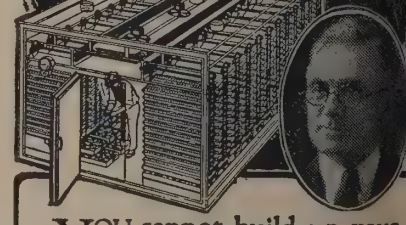
Banks, Ore. (Mrs.) E. L.

The condition noticed in this hen is undoubtedly not any sort of disease, in fact a person can be rather positive in their statements in this respect. The trouble is undoubted due to some sort of mechanical i jury, very likely something simil to a spur wound, which will cause i fection and a condition such as th to occur.

The condition which you have n ticed underneath the skin and t bunch which has collected is pus i fection or similar to pus infectio which would lead a person to come this sort of a conclusion.

The odor associated with that also a fact which would also lead the same conclusion. In fact t broken down condition which w noted at the beginning of this tro ble would also come in the same ge eral list of symptoms.

The fact that the rest of the bo was normal except the color that w noted in the liver is secondary to since the liver is sort of a strain for the entire digestive process, a is very apt to indicate an abnorm condition some place which it is e deavoring to take care of by th color which was noted.



A person would suspect that spur wound was the cause of it, b any sort of mechanical injury cou be responsible for it.

If the birds are out of conditio being too fat, and are hens, t thing to do is to cut down on t amount of grain feed which is giv to them, and cutting down on t grain will automatically increase t amount of mash consumption. flock is never going to become exce tionally fat on mash feed. I am a suming that these are hens that a over a year old which you are han ling, since with pullets we wish have them gain in weight to almo the first year. There is usually n much danger of an overly fat co dition in them during this time. Wi hens it is a different problem thou in decreasing the amount of gra given to them especially in the mor ing will improve the mash consum tion and automatically lower t weight of a bird by increasing e production.—J. B. HAYES.

"I always find that hen roosting the mail-box."

"Sure. It was hatched from a pa cel post egg."

A Good Foundation

YOU cannot build up your flock of poultry from a better foundation than on that of the quality, health and vigor of

Smith Hatched Chicks

The Smith 47,000 furnishes more fresh air and oxygen to every egg through its forced draft principle of incubation than any other type of incubator. That's why Smith Hatched Chicks are better, that's why so many hatcherymen have built their success on Smith performance.

If you don't know of a Smith equipped hatchery in your vicinity, write us.

his statement I have taken inventory at what things actually cost me. I have not allowed for depreciation on machinery as my machinery is second hand and the labor I have put on it has more than offset wear for this year. Also I have not credited the place with rent of house, milk, butter, eggs, potatoes, vegetables, and meat used, as this would be only guesswork. I have not made any credit for land cleared and leveled and fence built, nor have I charged the board of our one hand who lives with us. I think this shows a respectable profit for the year, owing mainly to the good price for potatoes. Also I can further verify my gains in that I paid last November a note for $1,000 on water rights and have met all interest and expenses on time without going behind any elsewhere. The salary credit for myself and wife is rather generous as I am a "lunger."

Rogers' Grade Guernsey Sale

The grade Guernsey herd owned by Luther Rogers of Hinsdale, Ill., was dispersed at the Chicago Dairy Cow Exchange, April 21. Sixty-three head, 2 registered bulls and 61 grade cows and heifers, sold for an average of $147 to buyers from Ohio, Indiana, and Illinois. One bull went to $360; the top cow brought $212.50 and the top 10 cows averaged $193. The lowest 10 head averaged $97.50.

Mack and Weiland did the selling and Reid Murray, manager of the "Exchange," had charge of the sale.

Dairy Farm Corn Crib and Granary

(Continued from page 553)

working space until spring when grain is being cleaned for seed. The size of the bins may be varied, depending on the crops to be stored. In case a portable elevator is available for filling, scuttles may be provided in the roof. Usually the filling will be done from the driveway. This driveway also serves as a work space and as a shelter for a wagon, buggy, or auto.

The construction should be strong, as a building for grain storage will surely be filled to its utmost capacity at some time. The plan in Fig. 2 shows the details of construction quite clearly. At first glance the joist and studding may seem to be stronger than actually necessary, but when it is remembered that the building must stand plumb and firm after many years, if it is to prove an economical investment, the dimension of lumber shown is entirely justified. The proper spacing is also shown for the joists, studdings, and ties. It is 2 feet on center (O. C.). The roof is one-third pitch so that shingles may be used if desired.

Beveled corn crib boards one inch apart are used on the outside of the crib and a good grade of drop siding is used on the granary. Damage from mice may be reduced in the crib by putting hardware wire cloth next to the studding before nailing on the corn crib boards. This should extend up about 2½ feet and at this height a strip of sheet metal is placed around the crib to prevent the mice from climbing higher than the wire cloth. Strips of tin will need to be placed the doors to prevent entrance of m at these places. Concrete may be u for floors to good advantage in ma localities and will reduce the risk f waste from mice and rats.

The doors for filling corn cribs usually not hinged but slipped place when the corn is high enou to press against them and hold th in position.

Besides the hinged doors openi into the crib, these same openi should have removable boards wh may be removed when corn is to taken from the crib. If these movable boards are put in on a sl so that the lower may be remo first it may prove a great convenien These boards when in place resem the slats of a cupola or wooden ve lator.

In some locations a door open into one end of the crib may be c venient.

The ventilating trough for the c is good insurance against loss fr molding of the corn in unfavora seasons. It extends along the mid

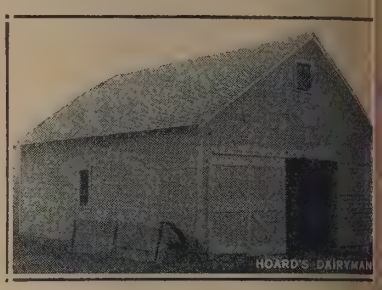

FIG. 3—CORN CRIB AND GRANARY

of the crib on the floor and the that can pass through it will in m cases prevent the corn from mold when placed in the crib before be completely dried.

A small granary suitable for a fa where it is desirable to store not o seed but the supply that is to ground for feed is shown in Fig. This building has four bins of ab five hundred bushels capacity ea In case of a large crop the alley work space may be filled at thresh time. The platforms and filling do may be omitted if a portable eleva is available for filling. The windo will serve in this case for an open for running the spout to the bins.

A building of this type is m very strong so that it will not se or spring out of shape. It is sho very clearly on the plan just w lumber is used and the spacing of dimension pieces.

Finds Trench Silo Valuable

HOARD'S DAIRYMAN:—The seve articles that have appeared Hoard's Dairyman have been of s cial use to me as I had tried to m silage in a trench without first ting it and had a good deal of sp age. Last year I got a 16-inch f chopper, put it on one side of trench silo, and put the Overland on the other side. I belted the t together and with the assistance my two young boys we filled our at the rate of a good load per ho and it cost us about 18 cents load.

We covered our silage with ab two feet of fine flax straw, and t put on 8 or 10 tanks of water. then tramped it down with hor The silage has kept very well and a forkful has spoiled. Despite heavy snow of the past winter have had no real trouble to ge out as not a particle of it has fro

I wish to thank you for the in mation you furnished and to that the trench silo will furn cheap feed and get results.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Letting Young Calves Run

A dairyman once said to the writer that he believed in letting his heifer calves "run," by which he meant that they should be pastured as soon as they cared to eat grass and then be kept outdoors as much as possible. His idea was that such outdoor life would insure hardiness of constitution which, he thought, was of supreme importance. We thoroughly agree with him that constitution is of vital importance, but there are two sides to the pasturing practice as concerns dairy-type heifer calves, and they should be kept in mind by the practical man.

Never shall we forget the woeful appearance presented by a lot of fine young Holstein heifer calves that had been on grass from the time they were a few weeks old. It was in the hot, dry weather of August that we were asked to examine these heifers. Some of them had died; the ones we saw were pot-bellied, scrawny, thin, harsh-coated, and weak. When they were made to run they immediately began coughing. The cough was of croupy character, painful, and was continued until the animal evidently raised phlegm. No wonder they coughed in that way, for they were infested with lung worms. We opened a calf that had died an hour or two before our arrival and found the windpipe literally packed with threadlike worms (Strongylus micrurus). Asked if he had suspected the presence of these worms, the owner said he had never heard of such a thing and that, perhaps, was the reason he had not feared to let the calves "run." Had he suspected worms he might have found the eggs or even some of the worms, by examining the discharged mucus from the nostrils or mouth with a low power microscope. It is well to make such an examination whenever pastured calves have such a discharge and especially when they cough.

It is almost absolutely certain that young calves allowed to graze old grass, in a permanent pasture or one long used by cows, will contract lung worms and that, inevitably, means stunting and, perhaps, some deaths. It is, therefore, advisable to keep growing calves off permanent pasture, not to let any calf that is less than two to four months old graze grass of any kind and always to supplement pasture by feeding skimmilk and providing a concentrate ration. It is the thriftless calf that is surest to become infested with worms and most quickly suffer ill effects or succumb to the ravages of the parasites.

Knowing the danger of worm infestation on old pastures, the wise dairyman keeps his calves off grass during the first year of life, lets them live in a clean, airy, roomy pen, and feeds them a complete ration that insures maximum growth and development during the first year. That is good practice, but it is unwise to prevent calves from receiving the beneficial effects of direct sunlight; outdoors, on all fine days. They need the good effect of the ultra-violet or "tanning" ray of direct sunlight and that ray cannot penetrate window glass. Its effect is to cause lime to deposit in the bones and phosphorus to form in the blood. It is, therefore, a preventive of rickets and, to a certain degree, is a remedy for that disease. Exercise and sunlight are necessary and should be allowed; but injudicious pasturing may do harm.

Sabadilla Safe

HOARD'S DAIRYMAN: — In your March 25 issue the question is raised whether or not sabadilla powder was safe to use as a louse destroyer. I wish to state that I have used it for a number of years without any ill effect on myself or on the cattle, but death on lice. I always used it pure but lately I take equal parts of sabadilla powder and sulphur, mix thoroughly and apply to cattle.

I used to apply it with a shaker can but I found it too slow. I take the paper bag containing the mixture and walk along and scatter a small handful over each critter affected and repeat in 8 or 10 days. That settles the lice. I never experienced any ill effect on myself only if I feel like having a good sneeze I take the curry comb and give the cattle a good rubbing just before applying the second dose. This should be done anyway, whether you need to sneeze or not.

Wisconsin. N. P. BECKER.

Worms of Sheep

What is a good stomach worm treatment for sheep? Last summer we gave the sheep a dose of one per cent bluestone solution once a month. This seemed to work but it is very difficult to drench them all because they fight so and they sometimes get some in their lungs. Is worm powder effective when mixed with salt as directed? What kinds would you recommend?

Sparta, Wis. A. J.

For destruction or explusion of stomach worms of sheep it is best to give the new Lugol's solution treatment. For lambs mix ½ an ounce of Lugol's solution with 1 quart of water, dose 2 to 4 ounces; for sheep and large, strong lambs mix 1 ounce of Lugol's solution with 1 quart of water, dose 4 ounces. For badly infested adult sheep mix 2 ounces of Lugol's solution with 1 quart of water, dose 4 to 6 ounces according to strength of sheep. Fast animal for 12 to 18 hours before drenching and withhold feed and water for 4 hours after treatment. An ounce dose of Epsom salt given in water 10 hours after treatment improves the effect of the treatment. Stand the animal on all fours when giving the medicine. Lambs should be drenched once a month when on contaminated pasture. Tobacco in salt, or proprietary worm powder for sheep is well worth giving a trial.

Signs of Pregnancy

Please advise what are the positive, sure signs of a cow's pregnancy, prior to any appreciable enlargement of the udder, etc.

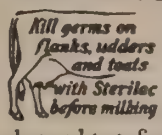
Sharps, Va. E. S.

There are no certain signs of pregnancy in its early stages. When a cow or heifer has been coming in heat at regular intervals of 21 days and the periods of heat cease after service, conception usually has occurred and these facts are most suggestive of pregnancy. Increase in size of the udder and abdomen come later. The bred cow also becomes quiet and tends to increase in weight.

Loss of Hair

I have a registered Holstein bull calf a month old. I noticed the hair is coming off on the hind leg and underneath. I know he has no lice. Can you please tell me the cause and a remedy.

Iowa, Minn. J. K.



Bathe the affected part with warm water containing two teaspoonfuls of coal-tar dip per pint. When dry apply a mixture of 2 ounces of flowers of sulphur, one-half ounce of coal-tar dip, and one pint of sweet oil or cottonseed oil. Repeat the application when needed. Keep the stall pen clean and well bedded, as wet and filth often cause such loss of hair and a sore condition of the skin.

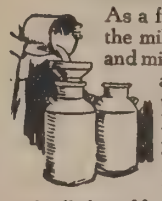
An Ideal Disinfectant

Clean Barns



Dirt and manure teem with bacteria and mold. Remove the dirt and keep the floors, stalls, walls and ceiling clean. Apply STERILAC to all parts of the interior to destroy germs and to provide a suitable place to produce milk of low bacterial count.

Clean Cows

Wash the flanks, udders and teats first with water and then apply a solution of STERILAC to kill all bacteria. This practice is very important in the production of milk having a low bacterial count. It is a reliable procedure in the production of wholesome milk.

Clean Utensils

As a further precaution keep the milk cans, strainer, pails and milking machine and separator clean. Rinse these utensils with STERILAC solution before putting milk into them. After milking scrub thoroughly all utensils with alkali and hot water and then rinse with STERILAC solution.

Clean Milking Machines

In case the milking machine is used the metal parts should be thoroughly cleaned in alkali and hot water and then cleansed in a solution of STERILAC. The rubber tubing, rubber cups and other parts of the milking machine which are difficult to clean should soak in the STERILAC solution until ready to use. It is an easy way of keeping the machine clean.

Clean Bottling Machine and Bottles

STERILAC solution is ideal for use in bottling machines. After the bottling machine is cleaned with alkali and hot water let a solution of STERILAC run through outlets to destroy germs which may be present in the corners and other interior parts of the machine. STERILAC solution will also destroy germs inside bottles.

Sterilac for Dairy Factories

Dairymen, butter, cheese and ice cream makers will find STERILAC a most satisfactory disinfectant. It destroys the germs which produce off flavors and other forms of spoilage. Use STERILAC solution in milk vats, separators and anywhere in the factory where dairy products are produced. STERILAC destroys all kinds of bacteria which spoil milk and produce disease. STERILAC kills germs—*it does* not spoil milk which comes in contact with it. That is a very good reason why STERILAC is safe to use to produce milk that is safe to serve as human food.

Ideal to Handle

STERILAC comes in powder form—will keep its strength. Sunlight does not affect it. Special introductory offer of enough STERILAC to make 60 gallons of the strength used for ordinary sanitation $1.00 Complete directions enclosed

Ayrshire Sire for Government Demonstration Farm

The purchase from the American Woolen Company, Massachusetts, of the thirteen-year-old proven Ayrshire sire, Yellow Kate's Exchange of Penshurst, has been announced by Manager Luther F. Sutton of the Reymann Memorial Farms, West Virginia. This famous bull will be used to continue a carefully planned breeding experiment with a herd of pure-bred Ayrshires presented to the state of West Virginia by the late Lawrence A. Reymann and now managed under the supervision of the United States Department of Agriculture and the West Virginia College of Agriculture.

After a careful survey of practically all available bulls that have proven by authenticated records of their daughters that they are able to consistently transmit high production, Yellow Kate's Exchange of Penshurst was selected for service in the Reymann Memorial herd. An official average of 11,062 pounds milk, 476 pounds fat has been made by 22 of his daughters, nearly all of which were tested as immature heifers. Furthermore, these heifers show an increase of 576 pounds milk and 68 pounds fat over the production of their dams, as mature cows.

Prior to coming into prominence in the American Woolen Company herd, Yellow Kate's Exchange of Penshurst was used by two different breeders in Maine and also at the Bellefonte Farm, New York. Although he was used only in small herds, Manager C. LeRoy Ambye felt convinced that Yellow Kate's Exchange of Penshurst was destined to become a great sire and used him freely at the American Woolen Company herd with the result that 46 sons and 144 daughters have been registered by him, and a great many cows will yet calve to his service.

Yellow Kate's Exchange of Penshurst was bred by David Wallace, Auchenbrain, Mauchline, Scotland, and imported to America in his dam, Auchenbrain Yellow Kate 3rd, one of the greatest cows of the breed. In the herd of Percival Roberts, Jr., Pennsylvania, this great sire was born and here his dam made the excellent record of 21,123 pounds of 4 per cent milk, 888 pounds fat. At one time her sister, the famous Auchenbrain Brown Kate 4th, also owned at Penshurst Farm, held the world's record with 23,022 pounds milk, 918 pounds fat.—Ayrshire Breeders' Association.

BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds

Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.

We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

Housing the Hog

(Continued from page 554)

doing for later, worms and the ious forms of the disease caused the filth borne germ *bacillus nephorus* took a heavy toll. The ner called in a specialist in swine eases to diagnose the difficulty l prescribe a remedy. The reme- ? There was no remedy for that rticular bunch of pigs—the dam- had already been done. The iedy was to prevent infection in future. The pigs could be far- ed in the central hog house but en they were old enough to be ned outside they must go on new d, not infected with worm eggs disease germs. The old yard was be plowed, and cultivated several es during the summer to get the eficial effects of sunshine.

Thus this farmer found that his central hog house could not be d to serve every need of his herd er his conditions. Thousands of ners have had similar experiences.

The old way of feeding hogs was take all the feed excepting blue- ss pasture to the hogs. It is now mmon practice among successful ne producers to let the hogs go to onsiderable portion of their feed n hogging down corn and grazing ge crops and to self-feeders. This not always be successfully done if sleeping quarters are confined to central hog house.

The need for disease and parasite rol, coupled with the economy of ing the pigs go to a portion of r feed, necessitates the use of col- or movable hog houses to a great- r less extent in connection with central house.

common practice is to clean central house thoroughly, scald- the floor and pen sides with boil- water to which lye has been add- n the proportion of one pound of to 30 gallons of water. As each is put into her pen for farrow- her sides and belly are washed warm water and soap. The bed- is clean and uncontaminated. n the pigs are old enough to go they are hauled to clean fields lly where good forage awaits n if they have not been farrowed early. Here they are housed in colony houses. The pigs are kept y from the infected yards until are 4 months old. Some men the colony houses the year round for farrowing and housing.

dvantages and Disadvantages

ere are some disadvantages of colony house. It takes more la- to look after a given number of . Getting water to hogs thus ed is frequently a difficult prob- With the use of self-feeders in ection with forage crops, getting to the hogs is not a difficult lem; however, it takes more time where the central house is used.

he chief advantages of the colony house are that parasites and dis- s may be effectively controlled, tter and better use of forage s may be had, manure is cast on ields, better gains are made be- e of the control of parasites and ses.

veral good bulletins are availa- n hog house construction. Of we mention the following ones ore complete and detailed infor- n. Bulletins 152 and 194, Iowa riment Station, Ames, Iowa; ers' Bulletin 438, U. S. Depart- of Agriculture, Washington, D. 8th NATIONAL CO-OPERATIVE HOLSTEIN SALE

Springfield, Mass., June 2nd, 1927

70 HEAD

America's BEST Holsteins

This great sale, held in connection with the Annual Convention of the Holstein-Friesian Association of America, will bring together choice representatives of some of the leading herds of the country.

Among them will be some five or six cows with records from 1000 to 1171 lbs. butter, and others with short time records up to 39.98 lbs.

The bulls include a son of the 39.98-lb. cow; a son of a 37-lb. three-year-old; a son of a 35-lb daughter of a 1000-lb. and 30-lb. cow; and son of a 1000-lb. and twice 33-lb. cow; a son of a 1096-lb. cow; a son of a 34-lb. heifer; several sons of 800-lb. cows. All these bulls are sired by well known and widely advertised sires and come from herds that are recognized as leaders of the breed.

It is Not Too Late to Get Your Name On the List For An Illustrated Sale Circular.

NEW ENGLAND HOLSTEIN ASSOCIATION
1694 Main St. -:- SPRINGFIELD, MASS.

You Never Before Had A Chance Like This To Buy Heifers

You know just what animals in your herd are most desirable, and nobody else can know this as you do. Nobody knows the animals in any herd as well as the man who works with them all the time.

There are two factors you keep in mind when you buy a heifer:

(1)—The heifer herself.

(2)—The potential value of that heifer as a producer and for the calf she carries.

Our Mr. Merton Moore (who has worked with Carnation Holsteins for seven years) has selected from the Carnation herd the 21 females that he would buy (price considered) if he were starting a herd of his own tomorrow. These are on sale at Oconomowoc, Wisconsin, and if you will write to Mr. Moore at the Oconomowoc office of Carnation Milk Farms, he will tell you what cows and heifers he selected, the price he put on these heifers, and why he selected these.

Address all correspondence to

NATIONAL ORMSBY SALE

150 HEAD

Every One a Descendent of

PIETERTJE MAID ORMSBY 78051
Butter 7 days 35.56
Butter 30 days 145.66
(World's Record, 1911)

More great producers, more great sires and more great show animals trace to Pietertje Maid Ormsby than to any other cow of her time.

THE THREE GREATEST SIRES of 1000-lb. producers are descendants of Pietertje Maid Ormsby. The leading sire is Ormsby Korndyke Lad, 21 over 1000 lbs.; second is Sir P O M, 16 over 1000; and third, Sir P O M 37th, 13 over 1000. One is a son and the others are grandsons of Pietertje Maid Ormsby.

BOTH GRAND CHAMPIONS and 10 of the 16 first prize winners at the last National Dairy Show were descendants of Pietertje Maid Ormsby, as were also 15 of the 19 first prize winners at the Dairy Cattle Congress and 8 of the 15 All-American selections.

MANY WORLD'S RECORDS for both milk and butter, in the short and long time divisions, have been broken by descendants of Pietertje Maid Ormsby.

ORMSBYS *for*
Type — Production — High Test

Greatest Array of Holsteins of Ormsby Blood Ever Offered at Public Auctio

The animals in this sale have been carefully selected from the leading ORMSBY herds in Iowa, Wiscor Michigan and Minnesota. The Money-making Dairy Cows On American Farms

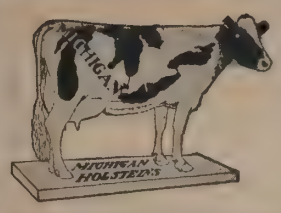
IN the fifty years that the Black-and-White cow has been producing in numbers in the United States she has surpassed all other dairy breeds in the production of both milk and butterfat and has established herself as the money-making dairy cow on American farms. She now represents sixty per cent of the pure-bred dairy cattle in the United States and holds all records but one for the production of milk and butterfat. She is the logical farm cow because she produces at a profit on the average farm.

The Forty-second Annual Convention —



For the forty-second time in as many years the Holstein-Friesian Association of America will meet in annual convention in Springfield, Massachusetts, May 30—June 2 to honor the Holstein cow. All Holstein breeders are welcome. An open forum for the discussion of Selective Registration, Herd Test Plan, and other subjects will be a part of the convention. A national sale and a wonderful program of instruction and entertainment will await convention delegates and guests.

$250 — Dean Segis Bess Ormsby — $250

BORN AUGUST 26, 1926

We offer this week, a nice straight typy bull calf, eight of whose fifteen nearest dams, average 1070 lbs. butter for their 305-day or yearly records.

SIRE—Dean Colantha Segis Ormsby, a richly bred Ormsby show bull of 1000-lb. breeding.

DAM—Lashbrook Bess Ormsby, with a junior two year old record of 552 lbs. butter in 305 days.

You will like this bull. Send for pedigree and photo.

WINTERTHUR FARMS, Winterthur, Del.

How one farmer got clover started—

A Cole County, Missouri, farmer has a 10-acre field which would not grow clover. Acid phosphate, bone meal and other fertilizers were tried without success. The county agent was consulted about the troublesome field. A test revealed the fact that the land was sour and needed 3 tons of crushed limestone per acre. The limestone was applied. During the following spring, clover was again sown and, for the first time, an excellent crop resulted.

What fertilizers tell you about buying oil

Bone meal or acid phosphate may be sufficient treatment on one field but not on another. Soil conditions vary widely. Engines vary widely, too. They vary in design, in lubricating systems and in other important factors affecting lubrication. Don't grope in the dark after the correct grade of oil. Take advantage of the recommendations of the 42 Mobiloil engineers, just as you take advantage of the advice of your county agent. By following the Mobiloil Chart you obtain an engineering margin of safety in lubrication.

2 drops of oil . . . *versus* . . . 3 drops

THE correct grades of Gargoyle Mobiloil for engine lubrication of prominent passenger cars are specified below.

The grades of Gargoyle Mobiloil, indicated below, are Mobiloil "E," Mobiloil Arctic ("Arc"), Mobiloil "A," Mobiloil "BB," and Mobiloil "B."

Follow winter recommendations when temperatures from 32° F (freezing) to 0° F (zero) prevail. Below zero use Gargoyle Mobiloil Arctic (except Ford Cars, use Gargoyle Mobiloil "E").

If your car is not listed below see any Mobiloil dealer for the comp.ete Chart. It recommends the correct grades for all cars, trucks and tractors.

GARGOYLE
Mobiloil
Make the chart your guide

2 drops of Gargoyle Mobiloil cost less than 3 drops of ordinary oil. And 2 drops of Mobiloil frequently lubricate longer than 3 drops of ordinary oil. This brings the bill of Mobiloil well below the bill for oils selling for less per gallon.

And other savings usually follow the use of Mobiloil—marked reductions in carbon deposits, in overheating, in break-downs, and in repairs. Mobiloil has an extra margin of safety to meet every engine need. By supplying the most economical lubrication, Mobiloil has become the most popular oil on farms today.

If you are interested in the most economical and efficient lubrication, you will be interested in talking with the Mobiloil dealer. He has the complete Mobiloil Chart. And he can supply you with the correct grade of Mobiloil for your car, your truck and your tractor. You will find Mobiloil well worth a special trip to town, if necessary. Take advantage of the substantial saving on barrel and half-barrel orders of Mobiloil.

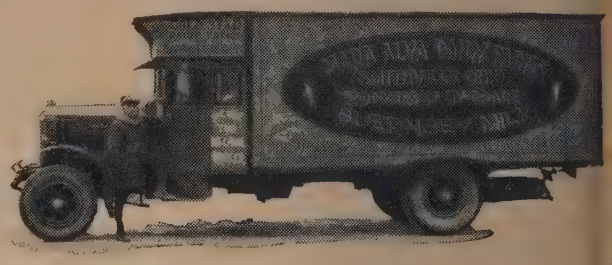
THE LIBRARY OF THE
UNIVERSITY OF ILLINOIS



Some of the noted purebred Jerseys kept at Biltmore Farms, estate of the late George Vanderbilt at Biltmore, N. C. The management writes, "We consider the De Laval essential wherever the purest and best milk is produced and we take particular pride in having standardized on De Laval Milkers."

Left: These five cows are typical of the high-producing Holsteins at the famous Serradella Farm, Oscoda, Mich., where the De Laval Milker has proven highly successful. Each has produced 30 lbs. or more of butter in seven days; their records running from 30.23 lbs. to 41 lbs., made three times by Eco Sylv Belle Pietje, on the extreme left.

Right: This truck delivers the milk produced by the De Laval milked purebred Guernseys at Mara Alva Dairy Farms, Smithville, Ohio. The Mara Alva Guernsey herd is one of the finest in the Central West.

Why So Many Owners of Purebred Cows and Producers of Clean Milk Use the De Laval Milker

ON hundreds of farms where valuable herds of purebred cows are kept, the De Laval Milker is used exclusively to insure better milking. Experience has proven to the owners and managers of these herds that the De Laval helps keep teats and udders in better condition and milks with far greater regularity and gentleness than the average hand milker is capable of. A few of these prominent herds are illustrated.

The De Laval Milker is also acclaimed by users as a great aid in the production of more and cleaner milk. Hundreds of dairymen making Grade A and Certified milk regard it as an assurance of regular premium money. Its combination of sanitary features, found in no other method of milking, makes for greatly lowered bacteria counts and cleaner milk in every way.

For detailed information on the De Laval Milker write to the office listed below which is nearest to you. A post card will bring a De Laval representative, who will be glad to go over your milking problems with you. No obligation, of course.

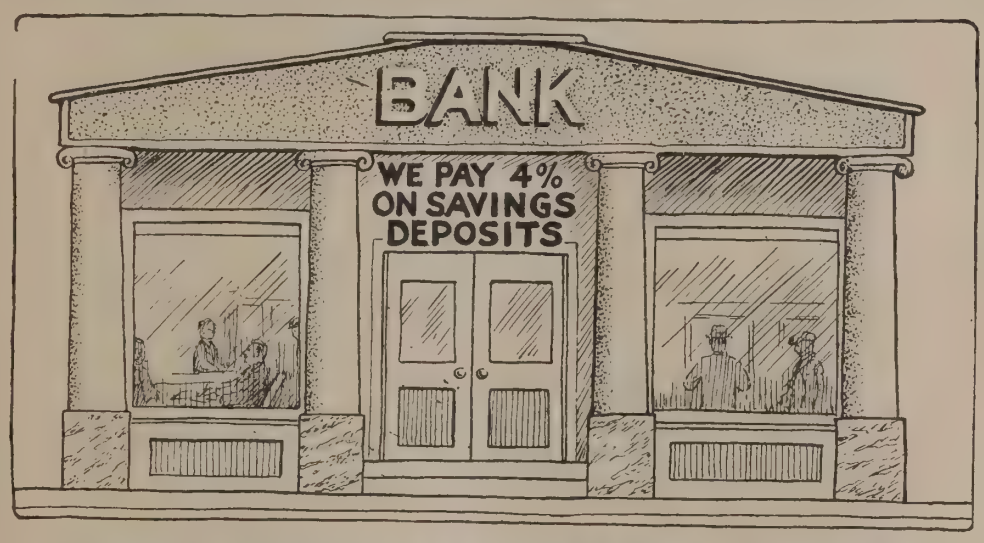
INFLUENCES AFFECTING TEST OF MILK

G. C. HUMPHREY, Wisconsin College of Agriculture

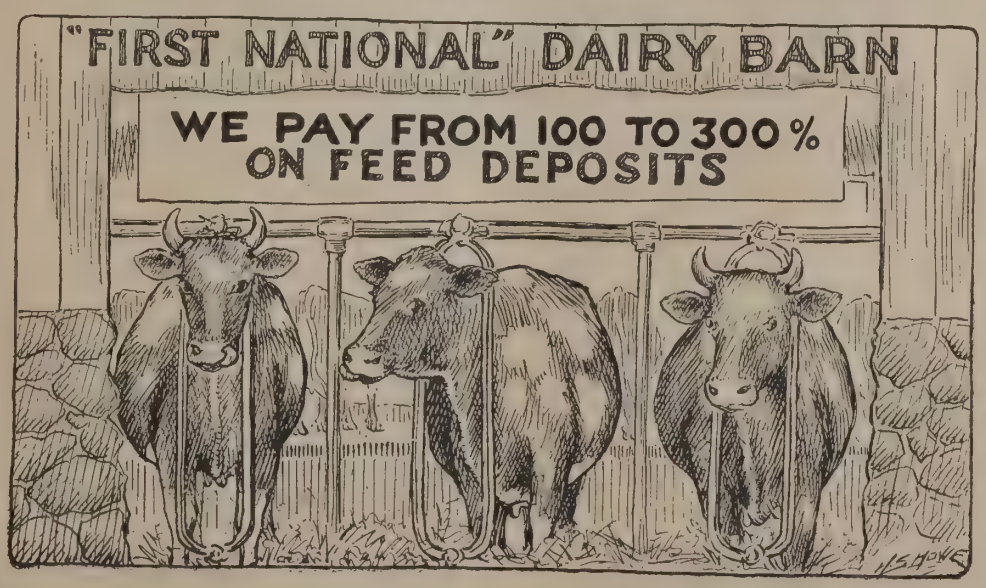
UESTIONS and controversies not infrequently arise relative to variations and the possibili- of producing variations in the cent of fat in milk. The facts ing to this subject are not new are quite generally understood. ever, on the basis of the axiom, need to be reminded more than eed to be educated," it appears h while in the interests of dairy and milk production to re- the results of observations studies which have been

e milk production ability of dairy cows of all breeds nat- responds to improved ds of feeding, care, and gement, with results, how- that are largely apparent quantity rather than qual- milk flow. The per cent of fat in milk from given in- al cows varies more mark- rom one milking to another one ordinarily appreciates. all number of the cows of a herd may vary from 3 per r even less to over 6 per n the fat content of their A somewhat greater num- ay vary less than 1 per while the large part of the ill vary only 1 to 2 per In making such observa- sampling the milk for but- tests is an important fac- r the reason that the first rawn from the udder at g time is very low in fat , while the last milk from the udder is very d may approach a test of cent. Despite all of these variations, the average milk from given cows over or less extended period of ill be very uniform. In and under normal condi- fair sample of the entire roduction of a given cow or two days will give a eristic and reliable test given season or stage of n and enable one to arrive ir calculation of the but- production.

season of the year is a in the variation of tests monly understood. Ap- the results of tempera- d humidity of the weath- se a variation that results relatively low test begin- rly in the summer and con- until the fall and winter when a gradual increase in cent of fat takes place. It is that the seasonal variation est of milk from individual more marked in southern northern states. This sea- ariation in the per cent of ilk is especially noticeable in of test cows and undoubted- ore responsible for the low tests often reported in early summer when cows have been turned to pasture than is any other one factor.



The stage of lactation has some influence on the test of cows but tends to vary with cows of different breeds and with the manner in which cows are managed. In general the test of milk declines during the first and second months after cows have freshened and then gradually increases to the highest point at close of the lactation period. Data relating to cows on test collected by C. H. Eckles, one of the best dairy authorities, indicate that Holstein and Ayrshire cattle show a decline from the first to the third month and a marked rise after the eighth month, while Guernseys and Jerseys, which produce milk of higher fat content, do not show such variations, at least in such marked manner.



Feed as a factor in influencing the per cent of fat in milk is most often the subject of controversy. Cows maintained on poor rations may test relatively low in per cent of butterfat, due to a natural characteristic or some other unexplainable cause, but improved rations for such cows tend to improve their condition and to increase the amount of milk flow without appreciable or marked influence on the per cent of butterfat. Feeding and fitting cows in a manner to produce extreme fatness during the dry period and prior to freshening time, combined with a system of careful feeding and management in the following lactation period, result in a large milk flow and a per cent of butterfat in the milk that may be unusually high for a period of twenty to thirty days or even longer, depending on the individuality of the cow or other factors not understood. Apparently under these conditions the cow has the ability to transfer the surplus of fat stored in her body to the milk flow and in a manner to make an appreciable increase in the per cent of fat in the milk. Under any other system of feeding it has been impossible to demonstrate in a clear manner how feeds and feeding may make any appreciable or marked change in the per cent of fat in milk.

Age is another factor often mentioned in relation to the butterfat test of cows. Studies which have been made indicate that within the age cows are tested for official and Advanced Registry records, no variation in test may be attributed to this factor. After cows have passed the prime of life and commence to decline in strength and vigor, the per cent of fat in their milk tends to decrease. Again, questions arise relative to the influences of excitement, ill health, drugs, and other unusual conditions, on the per cent of fat in milk. The results of such influences tend to produce variations that cannot be predicted and which in most instances are uncertain and disappointing.

In conclusion, the per cent of fat in milk is a breed and individual characteristic which tends to vary more or less in a manner and for reasons that cannot always be explained. Systems of management and feeding that approach most ideal conditions for normal health and condition on the part of the cow tend to give most uniform results in quantity and quality of milk flow, and in providing such a system of management and feeding, dairymen have the opportunity to best improve their herds and to secure most satisfactory and profitable results.

SPEAKING OF INTEREST RATES

Computing Farm Prices

The collection of statistics on farm prices and methods of computing index numbers are described in a new publication by the Department of Agriculture, entitled "Reliability and Adequacy of Farm Price Data." The publication, Department Bulletin 1480—D, is designed to meet the needs of those students and research workers in the field of agricultural economics who may have occasion to work with the farm-price data which are collected and published by the department. It is intended primarily for those students who are familiar with technical statistical terms.

Copies of the publication may be obtained, as long as the supply lasts, from the Department of Agriculture, Washington, D. C.

Aunt Ada's Axioms: The sun always shines brighter on those who are willing to reflect a little of it.

Beautifying the Country Roadside

GUY A. PETERSON, WISCONSIN

INDIGENOUS TREES, BIRCHES, PINES, AND OAKS MAKE THIS CURVE IN LANGLADE COUNTY A BEAUTIFUL ONE BOTH IN WINTER AND IN SUMMER

THE farmers' first duty toward making the countryside more beautiful is to plan and plant their home grounds. If every farm home along our highways were properly set in an artistic frame of trees, shrubs, and flowers, the problem of roadside planting would in a large measure be solved, for then every farmer would appreciate the value of beauty and would aid in making the roadway to his residence more pleasing.

What is Being Done

The public sense is gradually being awakened to the value of roadside beautification and many types of organizations are pushing this work along. A few examples of what has been done may serve as a precedent for what can be accomplished in the future. Kane County, Illinois, is planting the full distance of the famous Fox River Trail. The Jefferson Davis Memorial Highway Association adopted the plan of planting pecan trees as mile posts along its highways from Richmond to Vicksburg. Some states have appointed landscape gardeners to direct the location, selection, and care of new plantings as well as to guard against the destruction of the old.

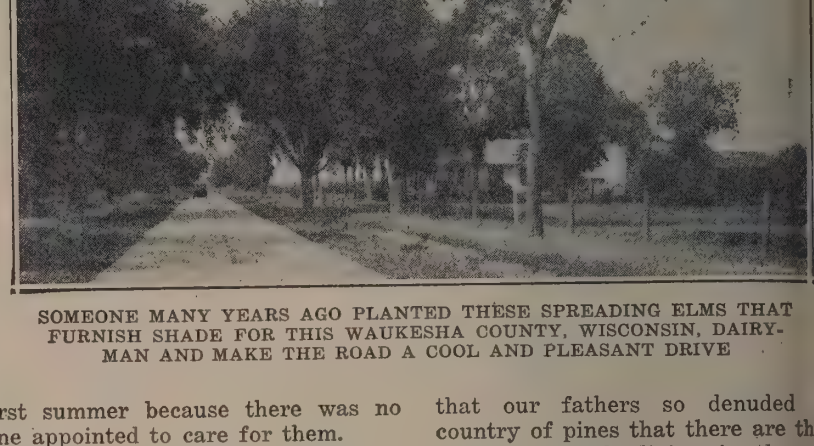
N. M. Isabella of the Wisconsin Highway Department has instructed the patrol men in his state to give every possible care for the natural beauty along the roadsides. Wm. T. Cox, forest engineer for Minnesota, says, "If we are to satisfy ourselves and captivate the visitors who travel through the state we must have attractive highways as well as good roads." So efficiently is this program being pushed that Minnesota now styles herself "the state with the tree lined highways."

L. H. Taylor of Lodi, California, advocates the reduction of taxes at the same time as country roads are beautified through the planting of government owned walnut trees on each side of the highway at intervals of 100 feet. Some counties are trying his scheme. Moreover, the California Highway Commission started a state nursery for tree propagation in 1922, from which very satisfactory results have been obtained. Los Angeles County spends $7,000 a year for taking care of roses along her highways. Roads locating engineers in Pennsylvania are instructed that "there is no excuse whatever for any trees being unnecessarily destroyed or injured during the progress of the work."

There are no doubt communities in every state that are striving to make surroundings more livable. It is well that this is so, for as John S. Donald of the Wisconsin College of Agriculture has said, "Surroundings have always struck deeply into the lives of people. Patriotism is founded on the satisfaction of one's surroundings and this influence exerted on youth is never lost or forgotten." The farm boy who is reared in a home where attention is given to beauty is not so apt to go to the city to live as is the boy who grows up in a family where no thought is given to trees and flowers.

There is little use in setting out trees along a highway unless they are taken care of at least until they get a start. Thousands of memorial trees have been planted in recent years under the excitements of oratorical speeches, but in many cases they have not survived the drouth of the first summer because there was no one appointed to care for them.

NATURE HERSELF PLANTED THESE TREES AND GENERATIONS OF BEAUTY LOVING FARMERS HAVE SPARED THEM FOR THE ENJOYMENT OF ALL WHO PASS



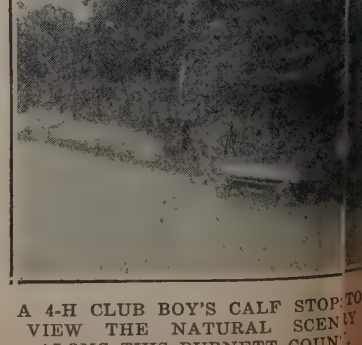
WHO WOULD NOT THRILL AT SEEING A BEAUTIFUL HERD OF WISCONSIN HOLSTEINS THROUGH A VISTA OF TREES SUCH AS THIS

How Can the Farmer Help

In addition to the beautification and planting of the farmstead, the farmer can help in this program in many ways. He can prohibit the posting of ugly advertisements upon his land. We do not wish to discourage outdoor posters entirely, because some roadside signs hide even uglier views and there is a legitimate place for such advertising, but we do object to the nondescript type of signs that obstruct one's vision along many roads today. In Massachusetts these outdoor advertisements may not be placed even on a farmer's land unless the advertiser first secures permission from the road commission. In most states, however, no such provision is made so the advertiser places his signs almost at will, as few farmers realize the value of their location and fail to charge an adequate rental.

In many states the property owner can prevent telephone and service companies from needlessly butchering the trees along his land. Since he owns the trees no one has a right to cut or injure them without his permission, except for road building purposes, so when a service company or individual does so the owner can collect damages.

Another way in which the farmer can help keep the roadside beauti is to refrain from cutting the tr that still remain. In spite of the f



SOMEONE MANY YEARS AGO PLANTED THESE SPREADING ELMS THAT FURNISH SHADE FOR THIS WAUKESHA COUNTY, WISCONSIN, DAIRYMAN AND MAKE THE ROAD A COOL AND PLEASANT DRIVE

that our fathers so denuded country of pines that there are th sands of people living in the v heart of the old white pine sect who have never seen one of th beautiful trees, we owe it to th who come after us to leave the co try as beautiful as it was when took over the land. In a section t was originally wooded, trees will ten come up of their own accor we only give them a chance. S trees, planted by nature, will be se more pleasing order than any we propagate. As is too often the c however, a land owner does not preciate the value of a tree excep terms of cords of wood or feet lumber. When the roots of s sturdy oak sap the strength from oat field he sees only the loss in y and lays low the giant of the fo that may be centuries old. Usu however, such a tree is not cut man who has grown to love it, b is cut by a new owner before the has had a chance to influence the duct of the man.

There are dozens of other th that a good farmer can do to r his roadway a source of pride and He can cut the weeds, trim objec able brush, and preserve that whi desirable. He can build good fe along the road, thereby not only proving the looks of his farm bu creasing its value and betterin credit at the bank. He can put neat looking mail box and stop editors from describing country boxes as "drunken, staggering licts that appear to be unworth government patronage." It is necessary to enumerate other t that the farmer himself can do, his sense of beauty has been a ened he will see enough to kee busy all the year through. over, it will be work in which h find happiness, as it will give hi ideal to strive for.

It may not increase his mon come but it will increase a

A 4-H CLUB BOY'S CALF STOP TO VIEW THE NATURAL SCEN ALONG THIS BURNETT COUN WISCONSIN ROAD

Beating the Labor Problem in Silo Filling

FRANK M. BYERS, ILLINOIS

Showing wagon bed nearly on the level of cutter. Cutter wheels buried to lower cutter and strengthen against belt pull.

YES, I have a silo on my farm, but I did not fill it last year; it takes too much labor and costs much," said a farmer to me. We ve all seen a good many silos that ve not been filled. Sometimes a ar or two of moldy silage has ped to discourage the owner. Every farmer knows that filling the o is the big job of the year. When consider the large amount of feed it can be put into the silo and red there for winter use, the labor s not seem so great. see farmers digging corn fodder of the snow, feeding the fodder the barn, or even throwing it in barnyard. It makes a very poor d, the cornstalk is wasted, and the use cannot be returned to the soil ough a manure spreader, at least that year.

Trading Help

have several silos to fill and our always takes longer than our ghbors. The years that I filled with big custom outfit, my neighbors ped me more than I helped them, I found myself owing them a lot ime that had to be paid back some er way. Another outfit started in neighborhood, which complicated ters. he big outfit has its drawbacks. apid filling there is always a big le, and the outfit leaves so no re- ng can be done. n getting a big crew together, it necessary for some of the neigh-

One man watches the cutter and trac- sharpens knives and keeps a lookout anything that might get into cutter. dern cutter does not require a "feed- Wagon driver stands on ground to oad.

to come considerable distance. would be late getting on the job, have to leave early to get home. made a short day.

ling Without Tramping (1925)

ter considering all of these gs, I started two years ago to find s and means of getting my silos with a smaller crew. That year not save a great deal of labor, but I found out something that is going to save a lot of labor in the future. Two of the silos filled are the same size and of brick construction. I decided to fill one of these by our old "trot around" method of tramping, and one without tramping. The distributor pipe was used in both silos. In the one silo filled without tramping one man was inside working the distributor pipe. In the one filled by tramping, one man worked the distributor pipe and two to four men were busy tramping.

TRACTOR AND CUTTER USED

After this tractor was started it needed no further attention. Photo shows third silo filled.

In past years it was the custom to tramp the silage. Yet it happened that some years the silage was of good quality and other years there would be moldy spots. This fact would indicate that the silage did not spoil because of any lack of tramping.

The corn in 1925 was rather mature. About one ear out of twenty-five was in the milk. Most of the ears were dry and hard. Immediately after filling the silos the remaining corn was cut and shocked for fodder. This corn was not frosted. The silage was not cut very fine. Some water was added.

I was a bit uneasy as to the outcome of our silage from the silo that was not tramped. Especially so, since some of my neighbors said that it was a mistake not to tramp. However, there was no cause for worry. There was no spoiled silage in either of these silos, proving quite conclusively, at least for that year, that tramping was a waste of labor. So far as it was possible to observe by ordinary farm methods, there was no difference in the quality of the silage from these two silos.

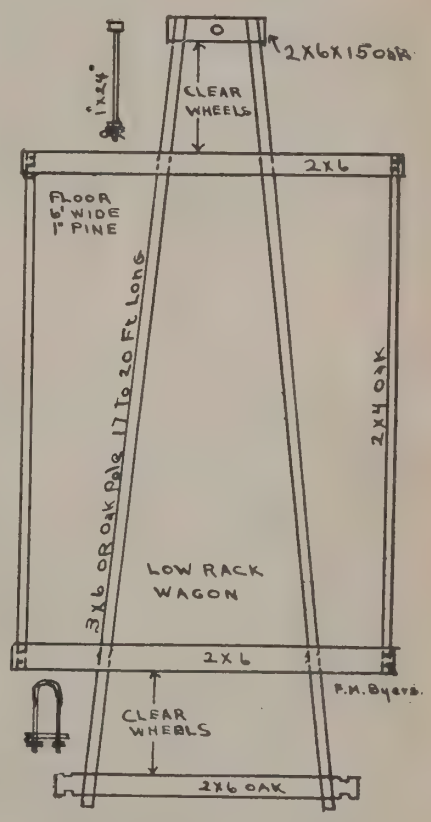
Taking courage from my experience of 1925, I decided to go it one better in 1926 and take off the distributor pipe. This was done. The outside blower pipe was set up to discharge the silage in the center of the silo, or as near it as possible. The top section of the distributor pipe was hooked to the goose neck and this could be moved to a position which would discharge in the center of the silo. This position was changed a few times as the silo filled up. The water hose was placed in this top section of the distributor pipe where the stream of silage would pick up the stream of water.

There was some tendency for the light and heavy parts of the silage to fall in spots as influenced by weight and fan blast. This fact was the chief reason for the use of the distributor pipe in the 1925 filling. It is proof of the average farmer's timidity in breaking away from established custom.

Observations were made on these spots as the silage was fed out and no mold was found. The fact that the light and heavy parts were not mixed in some spots was of no consequence, since sufficient mixing occurs as the silage is thrown down and fed.

Several doors were then put in, and all joints around the doors plastered up with clay. The silage piled up in the center and the only time anyone was inside was when more doors were put in, until the top was reached where it was necessary for two men to go up and keep the silage level.

The year 1926 was a bad year for the man who had silos to fill or any other outside work to do that could not be done in a boat. If the farmer could only regulate the weather, what a happy man he would be! His work is a continual gamble with the elements.



LOW DOWN WAGON USED

Note height of floor from ground.

Silo filling was started in 1926 on September 18. The fields were badly blown down by a tornado in August. The condition of the corn was a little too green for proper filling, but there were four silos to fill. To get rid of the disadvantages of the big outfit, I purchased a new outfit consisting of a 16-inch cutter and a 15—27 kerosene burning tractor.

Let me say that we found this new cutter much more efficient and economical from the power standpoint than our old cutters. The knives on our new cutter, which were on the fan, could be changed in fifteen minutes and without injury to the operator's hands. Any man who has changed knives on some of the old cutters knows that it cannot be done in less than an hour, and with danger to the operator's hands, since he must work over the knife edge.

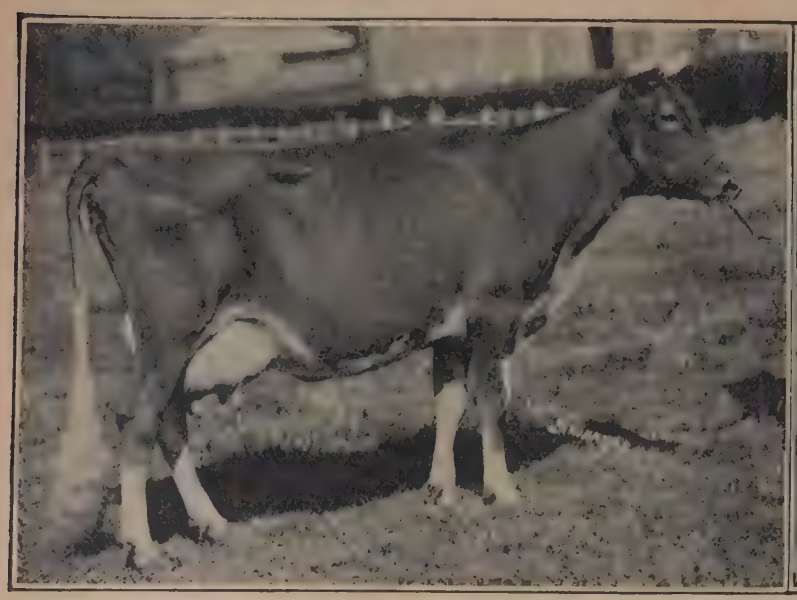
We also found that our kerosene-burning tractor was operated at a much lower fuel cost than our old gasoline tractors and gas engines. We used the one-fourth-inch adjustment for length of cut. The fine cut takes a little more power but the cows will not have any coarse silage to waste as is the case with the one-half- or three-fourth-inch cut.

THE LOW RACK WE BUILT

The two white oak poles are 18' long x 6" diameter. These make frame which is suspended under gears with long kingbolt and stirrup rods. Floor is nailed to these.

The first silo was almost full when a frost came. It was not a hard frost, but the corn began to die and dry up. No water was added to the first silo because the corn was green and contained sufficient moisture.

After the frost came and the corn began to dry up, the dryer the corn got the more water was added. A five-eighth-inch hose was running all the time and at night a lawn sprinkler was put on the hose and the water



(Continued on page 628)

THE TWO BRICK SILOS ON MIDVALE FARM, ILLINOIS

The cut corn was not tramped in either silo in 1926, yet the silage came out in good condition.

SNAPSHOTS AT RECENT GUERNSEY SALES

May Princess, consigned by J. L. Hope and bought by Howard Heinz for $5,000, the top price, at the Coventry—Dunwalke—Florham—Rockingham Sale.

A group of well known individuals: Fitzpatrick, South Carolina, southern fieldman for A. G. C. C. Horneman, Illinois; Wadley, New Jersey; Cooper, South Carolina; Gould and Bailey, New York.

Mr. Pyron and T. Chatham, North Carolina, purchaser high animal at Emmadine; W. W. Marsh, Iowa.

Mr. and Mrs. Richard Woolworth, frequent bidders at the National and Combination Guernsey Sales.

J. E. Dodge, Manager Emmadine Farm, New York, and D. O. Brant, Brant Rancho, California.

Ralph Flinn, owner Beechwood Farm; John J. Costoff, Manager Beechwood Farm; Howard Heinz, owner Rosemount Farm; L. R. Harris, Manager Rosemount Farm. Both Mr. Flinn and Mr. Heinz were frequent bidders during Guernsey week when the leaders were in the ring.

John Ames, owner of Langwater Farms; R. L. Benson, Coventry Farm; D. G. Tenney, Rockingham Farm; and J. L. Hope, Florham Farm. Mr. Ames consigned the high priced male to the National Guernsey Sale and the other three were consignors to the Combination Sale the day after the National Sale.

The Coventry—Dunwalke—Florham—Rockingham Sale Enjoys $1,038 Average

While the National Guernsey Sale was being held many breeders examined the cattle consigned to this combination sale which was held the day following. That these breeders found the flesh and blood equally as desirable as the advertisements and pedigrees indicated is now well inscribed in 1927 Guernsey history. Sixty-six animals from the four herds owned by Messrs. Benson, Dillon, Hope, and Tenney brought a total of $68,475. Brisk bidding characterized the sale and only at very rare intervals did Manager Merryman and Auctioneer Bain lean forward and pour forth their very best to secure a reasonable figure for the consignor.

The high cow was consigned by J. L. Hope. She was May Princess, a granddaughter on her sire's side of Imp. Itchen Red Raider and on her dam's side, a granddaughter of Beda's May King. Imp. May Rose King sired both May Princess' grandams. Howard Heinz, Pittsburgh, purchased this cow for $5,000.

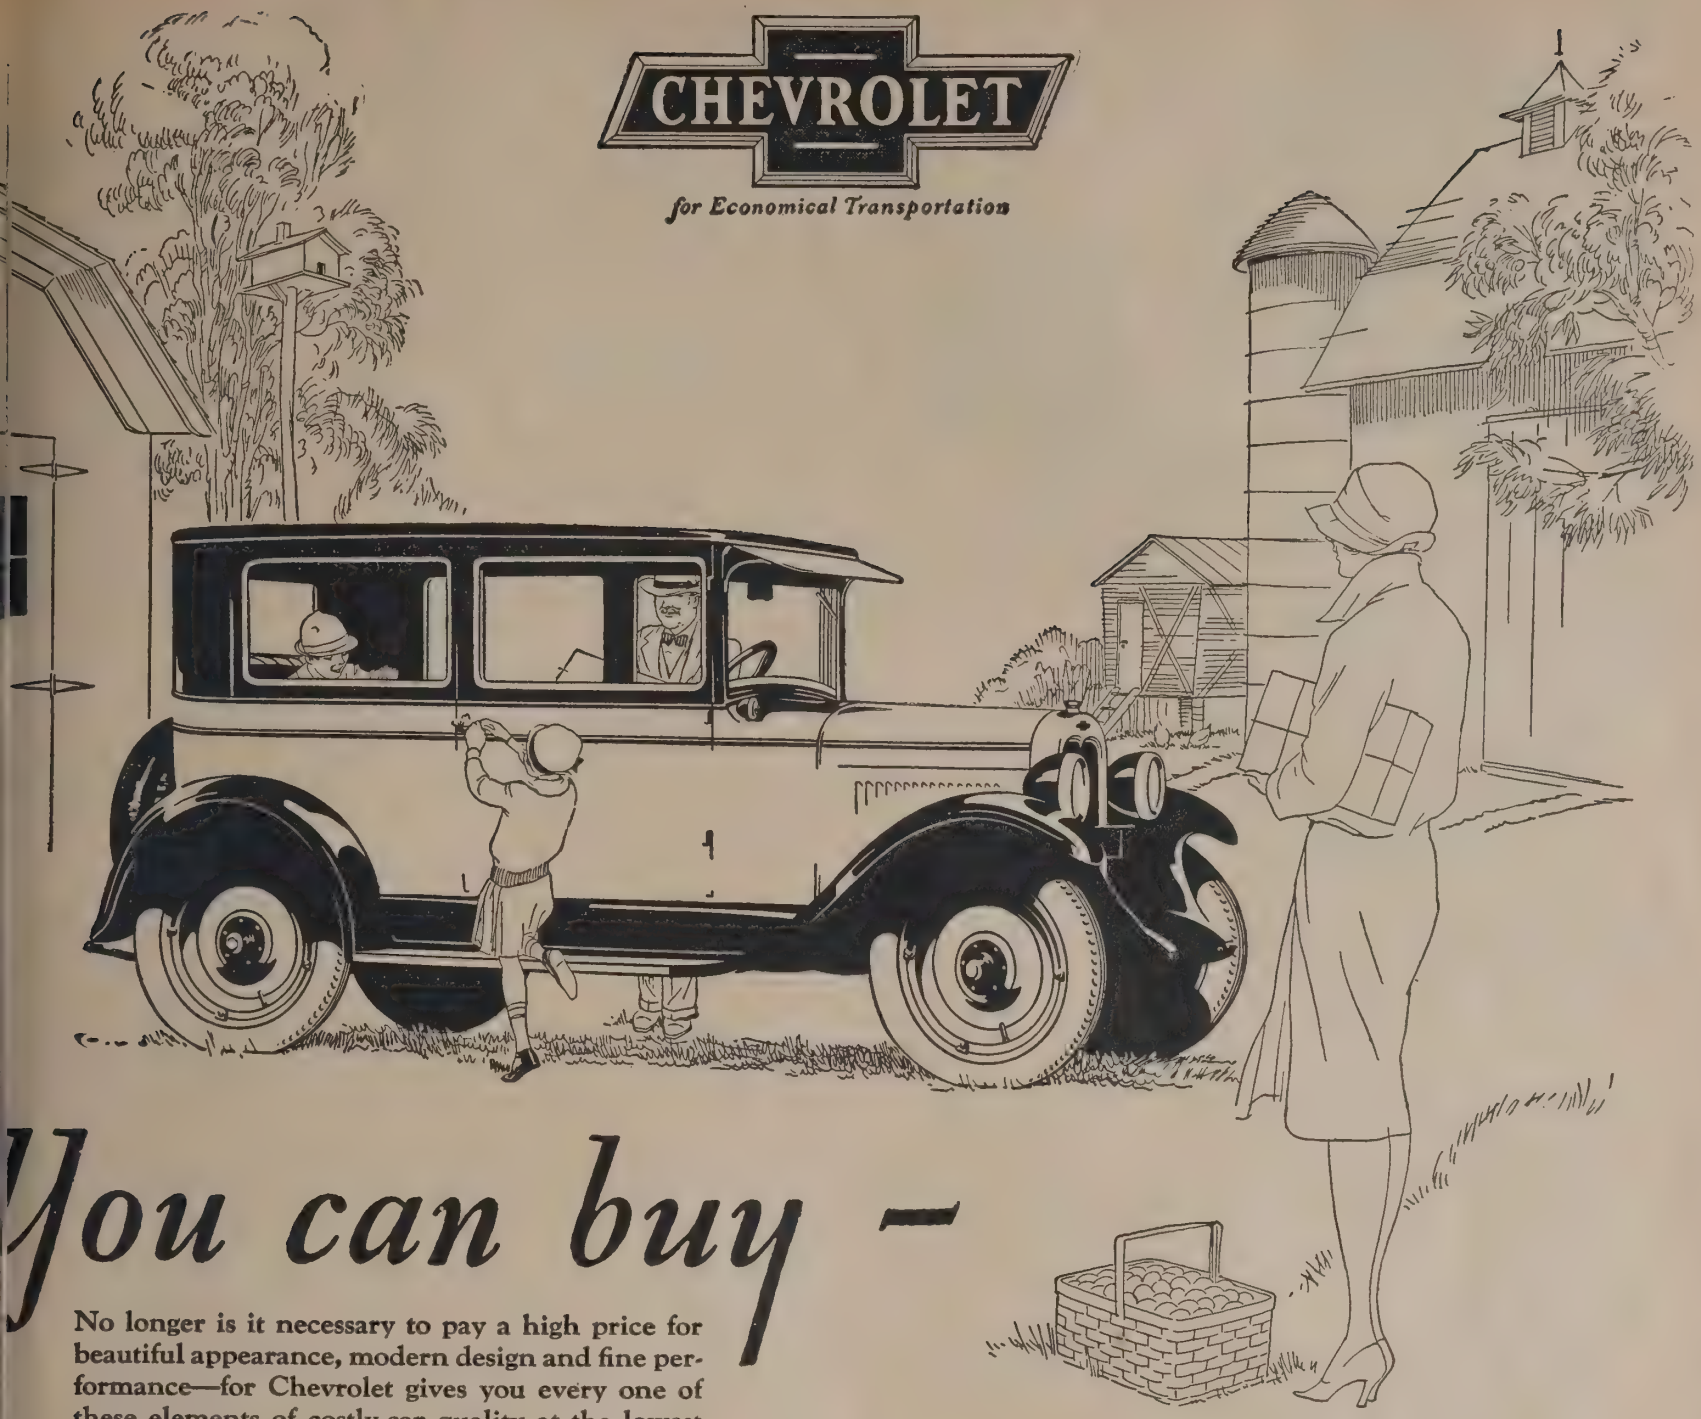
The high male carried much of the same breeding and also came from Mr. Hope's Florham Farm. He was Florham Challenger, a son of Florham Majestic and out of Marjorie of Linda Vista, now on A. R. test. R. F. Loree, New Jersey, purchased this calf for $3,000.

Coventry Farm had 22 head in the sale, all of which averaged $981. Their top priced individual was Coventry La France Rose that went to G. N. Dayton, Minnesota, for $2,100.

The Rockingham Farm consignment topped all others, thirteen head bringing an average of $1,588. All but two of these were bred by the consignor. Rockingham Dairymaid, a daughter of Langwater Halliston, was the high Rockingham individual. She went to Noyes Avery, Michigan, for $2,900.

The Dunwalke group of twenty, many a bit young, averaged $513. After this herd has been in existenc a while longer better averages wi undoubtedly be noticed.

The Florham cattle, numberin eleven head, brought $15,975 or a average of $1,452.



The following is a list of the ani mals bringing more than $700 an their new owners:

Coventry Consignment	
G. N. Dayton, Minnesota	
Coventry Spray	$1,90
Coventry La France Rose	2,10
Coventry Richesse Beauty	2,00
N. L. Avery, Michigan	
Coventry Dena	$87
Imp. Valentine of Clarimont	72
Mixter Royal Marion	70
Wm. A. George, Michigan	
Coventry Valentine Dena	$ 95

CHEVROLET

for Economical Transportation

You can buy —

No longer is it necessary to pay a high price for beautiful appearance, modern design and fine performance—for Chevrolet gives you every one of these elements of costly-car quality at the lowest prices available on a gear-shift automobile!

With the new Fisher bodies agleam with striking colors of lustrous, lasting Duco, individualized by full-crown, one-piece fenders, bullet-type headlamps and distinctive hardware—the new Chevrolet is a car of commanding style and elegance. Truly, the Most Beautiful in Chevrolet History!

No car, regardless of cost, is more modern in design and equipment. The powerful Chevrolet valve-in-head motor, with three-speed transmission and sturdy single-plate disc-clutch, has been made even better by such pronounced improvements as AC air cleaner and AC oil filter. A coincidental ignition and steering lock; a sturdy, handsome tire carrier and a full-size 17-inch steering wheel are further quality features that typify complete modern equipment.

And Chevrolet performance will delight you wherever you go. Velvety smoothness at every speed up to wide open throttle. Flashing acceleration that denotes a tremendous reserve of power! Cradled riding ease over the roughest roads!

Go to the nearest Chevrolet dealer and *drive* the new Chevrolet. Learn for yourself why Chevrolet sales are reaching new spectacular heights—with tens of thousands of new buyers turning to Chevrolet each week!

QUALITY AT LOW COST

If you want extra traction and long tread wear in addition to balloon tire comfort, be sure you get this quiet-running *new-type* Goodyear All-Weather Tread

You needn't send away for it

Right in your home town is the greatest low-cost tire mileage combination you can get anywhere.

That combination is the quality of Goodyear Tires and the *service* performed for you by your local Goodyear dealer.

He sells the world's finest tires at a range of prices to fit any pocketbook, and *you can see the tires before you buy.*

He recommends the right size and type of tire for your car. He puts it on the rim for you, fills it with air. He helps you give the tire proper care after the sale.

The Goodyear dealer's service will cut your tire bills down. Save you time and trouble. It's handy always; you needn't send away for it.

It is part and parcel of the Goodyear policy: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that users can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced Goodyear standard quality Pathfinder

Goodyear Means Good Wear

MILK STOOL PHILOSOPH

J. J. SPRENGER, MINNESOTA

IF I should stop to give credit to all the factors which have contributed to my well-being, as well as to the foundation of my character, I would have time to do nothing else, and even when I try to enumerate some of them in a general way I seem to be certain to overlook many because they are so near to me that I take them for granted. For instance, it came almost as a surprise to me to think that these developing agencies are by no means confined to humans but that the very animals with which I am working from day to day also help to make me what I am.

It has been well said that man is the only one of God's creatures who can blush and needs to. Man seems to be alone, also, in that he can smile but that does not mean that animals cannot be glad to see us and show it.

One of my friends has a dog which is no good as a watch dog, neither will he drive cattle, and the owner has often been asked why he did not kill that dog as long as he was no good. But all have been answered the same, "I could not think of such a thing because every time I came weary and discouraged and it just as if there was no one who that dog comes running to meet long way down the road and a way back he curls himself in kinds of shapes for joy, and th wags his tail and grins his teet in every way tries to show m glad he is to see me back. In he seems to be about as near joyed as a certain young darke was very agreeably surprised b one of his friends introduced h a group of young ladies whom h been very anxious to meet. this good fortune upset him s he began standing first on on and then on the other, and he said, 'Ladies, it's—it's just cating foo pleasure.' "

Farming is hard work, but v fine greeting we do get every ing; first the rooster, then th then the sheep, mules, colts, and even the pigs are glad to Humans may have all else, b nobody greet us and we can happy.

Milk and the Housewife

HOARD'S DAIRYMAN:—After a thorough investigation the Rockford, Ill., Department of Public Health has issued a bulletin, "Care of Milk at the Door Step." Dr. N. O. Gunderson, health commissioner, believes that much of the consumer's dissatisfaction concerning milk comes from careless treatment of the milk after it is delivered to the home. He cites three dangers:

1. Exposure to improper temperatures. In summer the milk is delivered from one to four o'clock in the morning. This means that it is often exposed to the warm summer air for several hours. Of course, under such conditions it cannot be expected to remain as pure as when delivered. The health commissioner suggests that ice boxes be arranged to open from the outside so that the milkman may easily slip the milk into them.

2. Exposure to dirt and chemicals. Under this head is classed street dust, coal dust, plain dirt, and rain water from porch roofs. Or trouble may come from leaving milk in rooms or garages where it is exposed to foul air, oils, greases, gasoline, or paints. Milk, it is sad to relate, is the one food product that has a special affinity for taking up odors and chemicals quicker than any other known food.

3. Exposure to domestic animals. Dr. Gunderson declares that more than twenty per cent of Rockford milk bottles are directly exposed to cats or dogs.

"So, Mr. and Mrs. Householder," concludes the health commissioner, "let us give just a little thought to the milk bottle tomorrow morning. Let's investigate the place where we ask the milkman to leave the bottle and see if we are fair to ourselves and the children, and even the milk dealer.

"Look into the feasibility of having the bottle placed directly in the ice box, or provide a simple, cheap thermos box that takes up neither heat nor cold."

The Rockford campaign for better care of milk in the home is to be commended. It means that the housekeepers are going to be better satisfied with their dairy products, and it will promote a clearer understanding between the consumer and dealer and dairy farmer.

Why would not the systemat tribution of such information uable in other cities? If the department does not seem wil promote it, the project wo worthy of the support of the or dairymen.

My Experiences as a Cow Tester

HOARD'S DAIRYMAN:—I have spent er two years as tester in the Nel-n, Minn., Cow Testing Association d shall, in this article, give some of y experiences which may be of help dairymen not situated so they can come members of a testing associa-n. I have found that regularity in eding, milking, and caring for cows one of the requisites of successful irying. I have also found that it is practice very commonly misused. ow easy it is to sleep for an hour ger on Sunday morning or to stay town an hour later on Saturday af-noon, but this little break in the gular routine of the dairyman will on put the dairy herd on the decline production.

Cows are creatures of habit and ll become nervous and restless if t fed or milked at regular times ery day. They will not produce lk to good advantage when in this stless condition. Some of the best rds in my association were best nply because of very regular feed-g and care. There is no doubt in y mind that if all the herds were ven as regular care in feeding, milk-g, and care as was possible to give, at the average production of the as-ciation would have been at least 15 unds of butterfat higher without y additional cost.

I have found that varieties of dif-rent grain feeds mixed together will ve much better returns even though e cost is somewhat higher. It seems at cows will have a better appetite d be less liable to go "off feed" nen they are fed a variety. A mix-re of 300 lbs. oats, 100 lbs. barley, d 100 lbs. bran with alfalfa hay d corn silage has been fed with od success in this association.

Members who practice individual eding according to production get e best returns for each dollar's rth of feed fed. I have found a few embers who take a sack of feed of st any kind and empty out a por-n for each cow. Some days a cow ay get ten pounds of feed and the xt day eight, when fed in this man-r. Common sense should show the ults of this method of feeding. Sev-al of my members use a small hand oop to measure out the feed for each w. A scoopful of feed can be eighed at intervals and the cows fed cordingly. A small scoop for this rpose can be very easily made from piece of tin, a piece of board, and a ece of an old fork handle.

I have found that the poor care and eding of the calves and dairy heif-s is also a cause of poor production some herds. Young cattle kept in ld sheds or out of doors and fed oughages only, cannot grow and de-lop properly to make the best of ws. Anyone should know that it is sier for a large cow to produce a rge amount of milk and butterfat an for a small one to produce the me amount.

Heifers bred to freshen at too ung an age is also a cause of poor oduction in some herds.

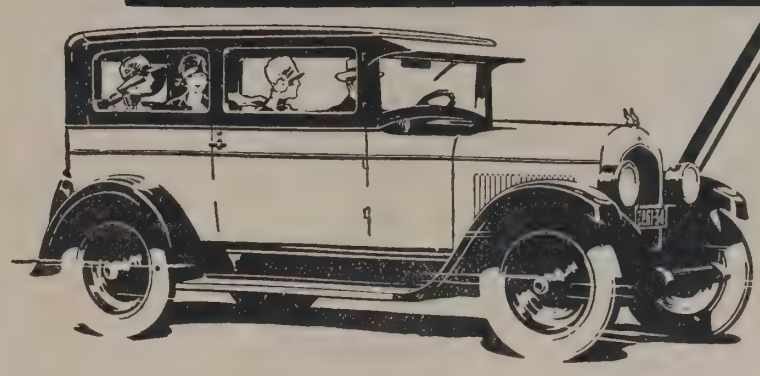
I have found that it pays to feed ain to high producing cows during e summer months as well as winter, en though the pastures are abun-nt. Cows fed some grain during the mmer months produce better dur-g flytime and the season of short, y pastures and the cows will also in better condition for fall freshen-g. Cows in good condition at time freshening will produce more and ep it up better than cows that are in in flesh.

The keeping of too many cows ems to be a common fault with any dairymen. A small herd, well d and cared for, will invariably pro-duce better returns and net profits than large herds cared for and fed in a haphazard way. The ten highest herds in the association for 1924 av-eraged only twelve cows.

Drinking cups for the cows have proved to be a very good investment in this association. Dairymen are quick to realize that large producing cows must have plenty of drinking water and have it often, which they do not have when watered in a tank outside. The saving of labor alone would soon pay for the cups.

During the first few months of test-ing, about 35% of the cream separa-tors were skimming poorly, several of them losing as high as $25 per month for their owners. This is another way that good profits may be lost if not checked regularly.

A summary of my experiences would be:



1. Cows should have regular feed-ing and care.
2. A variety of grains should be used in the ration.
3. Cows shoud be fed according to their requirements and producing ability.
4. Calves and young heifers should be well fed and cared for.
5. High producing cows should be fed some grain while on pasture.
6. Herds should be small enough to be fed and cared for properly to pro-duce the greatest profits.
7. Drinking cups are a very neces-sary equipment on a good dairy farm.
8. Cream separators are oftentimes the cause of poor profits from the dairy herd and therefore should be tested regularly.

Minnesota. MARION JOHNSON.

Another 1,000-lb. Producer

There are now 113 Holstein cows that have produced 1,000 lbs. butter-fat or more in a year. The latest ad-dition to this group, according to the Holstein-Friesian Association of America, is Linden Clara Pasma that produced 28,541.1 lbs. milk, 1,072.31 lbs. fat (1,340.38 lbs. butter) in 365 days as an 11-year-old cow. She was bred by H. W. A. Tramm and is owned by Henry Bouchard, both of Washington.

Opinions, Brickbats, and Bouque

These columns are open to the readers of Hoard's Dairyman for the expression their opinion on any subject, whether radical or conservative, destructive or constructiv wise or foolish. It may be cows or crops, religion or politics, or what at the time mo interests you. It may be critical or commendatory, but it should be your opinion. It your own editorial page but your editorial must not exceed 250 words. Hoard's Dairym assumes no responsibility for opinions expressed.

In Case of Drowning

HOARD'S DAIRYMAN:—The season for accidental drownings is at hand. Many precious lives are lost every summer through carelessness on the part of someone. It is not only the duty of everyone to observe caution in swimming and boating, but it is the mark of ignorance to fail so to do. Only the idiot rocks the boat or tries to see how close he can come to the current and not be carried away. Trying to do swimming stunts without adequate provision for safety in case the swimmer fails of execution is worse than foolish, and all too often results fatally.

The drowning one in his fright is prone to grab his rescuer about the neck and hang on, defeating both his own chance for life and that of his rescuer. His part is to be passive in the hands of the swimmer.

The first step in resuscitation is to restore breathing. Not a moment is to be lost. Dr. Gulick gives the following authentic advice: Lay the unconscious one on his stomach in a level place. Turn the head to the left so that nose and mouth are away from the ground. Kneel by his side or astride his hips. Place both your hands over the small of his back, with your thumbs nearly touching and fingers spread out over his lowest ribs. Swing yourself forward, counting three slowly in the forward movement. Quickly swing back, relieving pressure but keep your hands in position. In three more counts, repeat. Do it ten or twelve times without pausing.

New Richmond, Wis. J. E. T.

Disfranchise Farmers

HOARD'S DAIRYMAN:—You perhaps do not have opportunity to read the Long Prairie Leader, a local paper published in my state. This paper has taken a deep interest in agricultural problems and its editor, Mr. Rudolph Lee, shows clearly that much of the agricultural discussion can be attributed to politicians looking for recognition.

He recommends the farmer be disfranchised. It is his opinion that if this were done, politicians would not be bothering themselves about agricultural problems and people engaged in farming could then devote themselves without interference or distraction to solving their own problems. Farmers who read his paper and know how substantially he has supported every legitimate undertaking to benefit the rural communities, rather feel that his suggestion is a good one and I am inclined to think they feel it would be well to give his suggestion a trial.

Minnesota. JAMES BRADLEY.

Hoard's Doctrine Sound

HOARD'S DAIRYMAN:—Please send Hoard's Dairyman to the enclosed names, all of whom have recently bought registered Guernseys from us and have never read your paper.

We feel that they will not appreciate what we have sold them or know how to get the best results from them unless they can tap the stores of information that reading your paper will open up to them. In over twenty years among cows we have never met a good dairyman or cow man who was not a living advertisement for Hoard's doctrine and we never met one who had made a mess of the dairy business who had not failed carry out the good old Governor' vice. There may be something Mary McHaugenism but we that it could not have solved problems like the dairy cow has it. We needed a regular check month and manure to restore the tility to our worn-out acres. may be a political substitute for work but nothing beats the dairy for improving land and bringing steady income.

Virginia. A. G. INGHA

For Rural Police

HOARD'S DAIRYMAN:—In repl R. Mackintosh and J. G. Hunt wish to say I'm not paid by a to uphold rural police. But some will have to be done. I agree Mr. Mackintosh that laxity of la forcement is due to politics. sheriffs and mayors are too bought off and are afraid to some for fear of losing their Then why not have rural pol stranger who has no one to plea

I believe in the constitution U. S. A. and let's not lower the ards of our forefathers. Some are trying to serve God and the This can't be done. Sunday ballg pool playing, dancing, and gam are the devil's work and no ma go to these places and serve God a sword can't change a man's l let alone the constitution. The of our forefathers coming here to get away from high taxes serve God. Is it not too true again we are taxed high and w hardly allowed to serve God please? History has to repeat.

Handling Sweet Clover for Seed

HOARD'S DAIRYMAN:—When Wm. Darnbrough of Saskatchewan desires to grow sweet clover seed, he sows it at the rate of 10 to 12 lbs. per acre and it is not pastured or cut back at any time.

A definite time to cut the seed crop is recognized, that time being when the pods are about 50 per cent black in color. The ordinary grain binder is used and the plants are cut as high as possible. It is then shocked up in the same manner as a small grain crop.

Mr. Darnbrough finds that sweet clover threshes very easily if it is at all dry. He prefers to use a screen in the shoe of the separator of a size that will just permit the threshed grain to go through. This means that the threshed grain will come out under the machine. Any that goes through the elevator is put through the machine again.

Since he finds that sweet clover is valuable for the feeding of live stock, Mr. Darnbrough has been investigating the methods of handling hay. He says that the most satisfactory way is to cut the crop when the sweet clover plants are just beginning to bloom. Then he goes in with a binder and binds the crop, putting the bundles in small shocks, only about eight bundles in a shock. The sweet clover hay is thus handled in bundles which facilitates feeding it to stock.

Agriculture is rapidly adopting the power that has helped build industrial success.

The electrical industry brings forty years' experience to the farm

NO LONGER is rural electrification only "a possibility." The building of rural lines is in active progress; and the policy of electric light and power companies is to extend rural service as fast as circumstances will permit.

The electrical industry is applying the experience of forty years of service to cities and industry to the problem of delivering electric service to farms. Where the demand is sufficient to justify the building of lines on a business basis, farmers are having no trouble getting service. For, to derive the full benefit of rural electrification, the varied use of power as well as light must be applied. Only through cooperation between the producers and the consumers—light and power companies and the farmers—can rural electrification be brought about. The farmer should take advantage of the great variety of things electricity can do. The industry, meanwhile, is working with representatives of farmers in twenty states to devise new equipment and improve that now in use.

The benefits of electricity which are now enjoyed on 260,000 farms will be extended to hundreds of thousands of progressive farms within the next few years. Ask your power company for information and cooperation.

The Committee on Relation of Electricity to Agriculture is composed of economists and engineers representing the U. S. Departments of Agriculture, Commerce and the Interior, American Farm Bureau Federation, National Grange, American Society of Agricultural Engineers, Individual Plant Manufacturers, General Federation of Women's Clubs, American Home Economics Association, National Association of Farm Equipment Manufacturers, and the National Electric Light Association.

WAGNER SPECIALTY COMPANY — Burlington, Wis.

Work of Chester Hazen Honored

THE life and work of Chester Hazen, pioneer Wisconsin dairyman, were honored at the sixth annual field day of the State Live Stock Breeders' Association held June 8 in Fond du Lac County when a bronze tablet was placed on the site of the cheese factory which he built at Ladoga, near Rosendale in 1864, and said to be the first cheese factory erected in the Badger State.

Charles L. Hill, noted Guernsey breeder, presented the tablet which was accepted by J. L. Sammis of the Dairy Department of the University of Wisconsin. F. G. Swoboda, manager of the Wisconsin Cheese Producers' Federation, spoke on "The Cheese Industry's Place in Wisconsin's Agriculture." Other speakers on the program were: W. A. Duffy, State Commissioner of Agriculture, and Charles Everett, Editor Wisconsin Agriculturist.

Chester Hazen was born January 31, 1824, on a farm in Lewis County, New York. At fifteen he entered the molder's trade. In March, 1845, he came to Milwaukee seeking employment, and a year later he preempted 80 acres in Fond du Lac County, adding 160 acres in the town of Springvale, Fond du Lac County, the next year. During his first year on the Springvale farm he cleared 30 acres and fenced about 12 acres. In 1850 he built a house on his land and in 1854 married Jane A. Atwood of Vermont.

In 1864, Mr. Hazen built his cheese factory, patterned after those back in New York State. At one time this factory received the milk from 1,000 cows. Mr. Hazen bred Ayrshire cattle and raised fine horses.

In 1872 he was chosen the first president of the Wisconsin Dairymen's Association. He helped organize the first dairy board in Fond du Lac County in 1869, was its first president, serving three years and was also president of the Fond du Lac Agricultural Society for many years. In 1885 he was elected to the assembly where he served the agricultural interests of the state well. He helped establish the state veterinary department. Chester Haze died in 1900 having lived a most use ful life.

While Mr. Hazen is credited wit having built the first cheese factor

CHESTER HAZEN

in Wisconsin, there is record cheese having been made on a f tory scale in Wisconsin at a so what earlier date by J. G. Picketts Jefferson County. At one of early meetings of the Wisconsin D rymen's Association, Mr. Picke said, "On the first day of June, 18 my mother and myself, as assista made from the milk of thirty co owned by six patrons, the first che

manufactured in Jefferson Cou and I verily believe the first ma factured under the co-operative tem in Wisconsin, and exactly years before Jesse Williams, in 1 earned the historical notoriety of ganizing the American Co-opera System of dairying. The little ki en factory in the log house was erated on precisely the same pri ples as are the mammoth cheese tories of Jefferson County having patronage of a thousand cows."

Blessed be the memory of Che Hazen, J. G. Picketts, and all o great leaders of the dairy indus

Ground Kafir for Dairy Cows

In parts of Kansas and other southwestern states the drought-resistant qualities of kafir has caused it to be more generally grown as a forage and grain crop than corn. The feeding value of ground kafir grain for dairy cows has been compared with corn meal by the Kansas Station.

A basal roughage of alfalfa hay and sorgo silage was fed in the proportion of 1 of alfalfa hay to 3.16 of silage. The grain mixture in one case was composed of 4 parts of corn meal, 2 parts of wheat bran, and 1 part of linseed meal; in the other case 4 parts of ground kafir, 2 of b and 1 of linseed meal were use the mixture. The cows were fed cording to body weight and pro tion requirements.

Kafir proved to be 97.6 per cen efficient for milk production and per cent as efficient for fat pro tion as ground corn.

Another experiment by this s station found ground Kansas or sorgo seed practically equal to in the grain portion of a ration dairy cows.

Silage made from kafir or drought resisting canes has found nearly equal to corn silage dairy cows.

se barnyard millet that yielded of green feed per acre on farm Elliott of Clatsop Co., Oregon.

The seed should be broadcasted on a rather firm seed bed and harrowed in very shallow. Seeding can be done any time, providing the moisture supply is adequate from April to June. Of course, time of seeding will be determined somewhat by the date that the green feed is desired. In some instances this millet on fertile bottom land has yielded eight tons per acre with each cutting and as many as three cuttings have been obtained in a single year. Japanese barnyard millet has rather a low value as a hay crop and its principal use is for green feed purposes.

Oregon. W. L. TEUTSCH.

More Butter Needed

A call for 30 more creameries to join its ranks has been issued by the Land O' Lakes Creameries, Inc., Minneapolis. More butter has been sold for standing weekly orders and storage requirements than the member creameries are able to produce and deliver. The association needs another 10,000,000 lbs. of butter to hold the trade and supply its customers.

About 20 of the association creameries are now making sweet buttermilk powder and driers have been ordered by several more factories. There are also 23 creameries delivering their buttermilk at the concentration point at Litchfield to be dried. The buttermilk powder is in good demand for poultry and calf feed.

Sweet cream is shipped to eastern cities in carlots from Watertown, and will soon be shipped also from Glencoe. A set of requirements, based upon the rules and regulations established by the health departments of certain eastern cities, has been formulated by the association for the guidance of creameries and farmers, whether they ship cream or make butter.—Agricultural Co-operation.

The doctor entered the grocery store: "How's the cheese today?"

"Well, it's a bit stronger, doctor," replied the grocer.

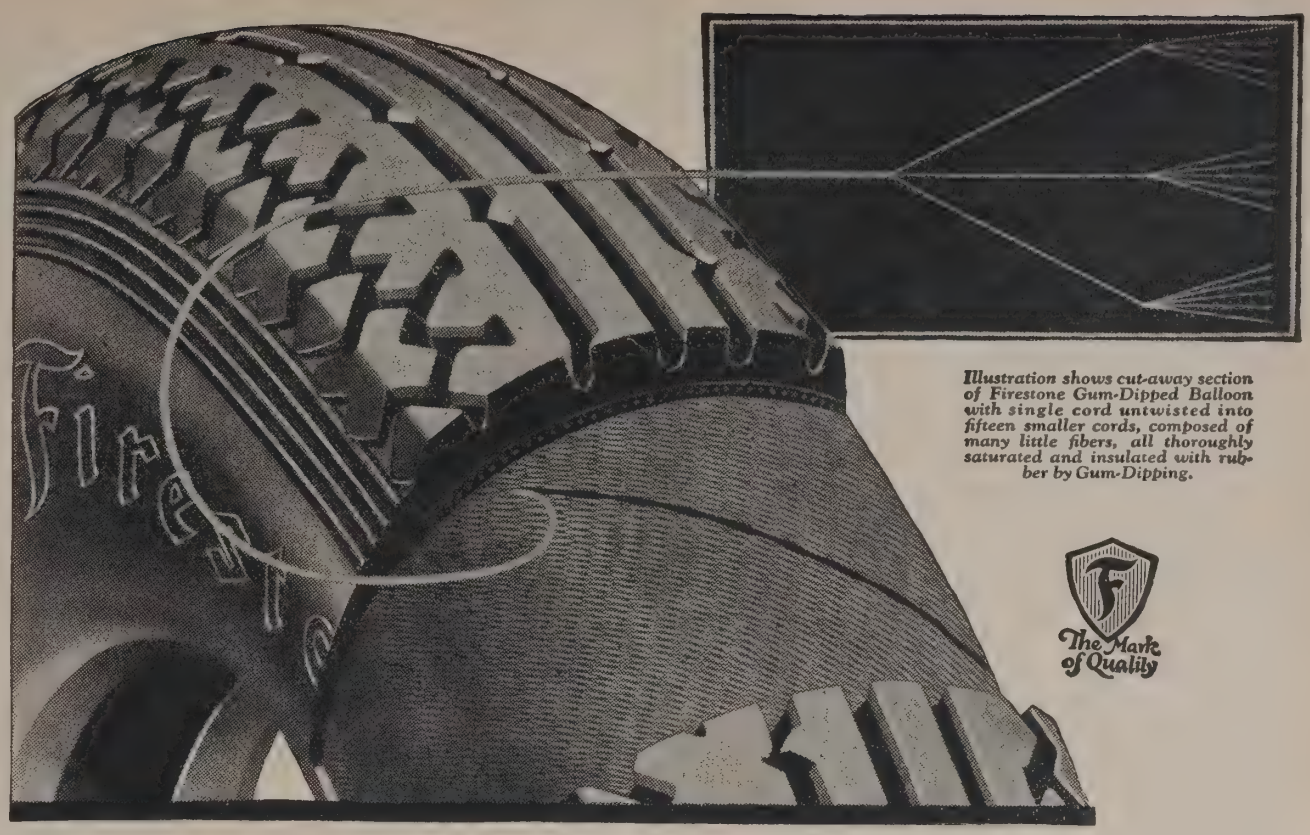

Illustration shows cut-away section of Firestone Gum-Dipped Balloon with single cord untwisted into fifteen smaller cords, composed of many little fibers, all thoroughly saturated and insulated with rubber by Gum-Dipping.

The Mark of Quality

Why **Firestone**

Dips the Cords of the Carcass in a Rubber Solution

In the old Fabric Tire, internal friction was excessive, and mileage low, the square-woven construction of the fabric being impossible to insulate with rubber.

Then came the Cord Tire, with cords in each ply laid parallel—no interwoven cross-threads—permitting much greater insulation of the cords, one from another. This materially reduced friction and more than doubled tire mileage. But the small cords were not insulated with rubber and destructive friction within the cord was not overcome. After much research Firestone chemists found a method of insulating every fiber of every cord with rubber—and called it "Gum-Dipping." By this process the cords of the carcass are dipped in a rubber solution which penetrates to the innermost fibers. Gum-Dipping made the Balloon Tire practical and established a new standard of tire mileage.

"JAY BEE" HUMDINGER

Crusher - Grinder - Pulverizer

UNEQUALLED AS GRINDER FEED SAVER—MONEY MAKER

"The Humdinger is the last word in efficient, economical grinding of all farm products," says Mr. Hunt of Mo. "It is an unusual grinder. Can't be excelled as feed saver and money maker. In a year we have had no trouble or repair expense."

The Only All Steel Hammer Mill

Made of boiler plate and manganese steel. Steel has four times the strength of cast iron. Practically unbreakable. Lifetime service. No heat or friction. Feed not heated in grinding.

"First Cost Is Only Cost"

Says W. A. Schultze, Stanton, Neb. "Have used my mill a year without one penny's worth of repairs. The quality and variety of feed ground on the "Jay Bee" cannot be duplicated by any mill in America."

"Always Dependable"

Say Ziegler Bros., Oakley, Kansas. "It has never failed us in any particular. Its capacity is far greater than is claimed. It delivers a quality of product never equalled by any other mill."

EDITORIAL COMMENT

THE strength and effectiveness of co-operation is well illustrated in one of Aesop's Fables entitled "The Father and His Sons:" "A father had a family of sons who were perpetually quarrelling among themselves. When he failed to heal their disputes by his exhortations he determined to give them a practical illustration of the evils of disunion; and for this purpose he one day told them to bring him a bundle of sticks. When they had done so he placed the faggot into the hands of each of them in succession and ordered them to break it into pieces. They each tried with all their strength and were not able to do it. He next unclosed the faggot and took the sticks separately, one by one, and again put them into their hands, on which they broke them easily. He then addressed them in these words: 'My sons, if you are of one mind and unite to assist each other, you will be as this faggot, uninjured by all the attempts of your enemies; but if you are divided among yourselves you will be broken as easily as these sticks.'"

Successful co-operative institutions have followed the teachings of this fable and it is well for all engaged in co-operative effort to heed its teachings.

CHANGING OCCUPATION

According to the United States Department of Agriculture, the farm population of the United States decreased 649,000 persons last year. It is estimated that 2,155,000 persons moved from farms to cities, towns, and villages last year, and that 1,135,000 persons moved to farms, making a net movement of 1,020,000 persons away from the farm. Births on the farms during 1926 are estimated at 658,000 and deaths at 287,000.

Since the depression in agriculture in 1920, there has been a faster movement from farms to cities and towns than in years previous. This does not concern us as much as it does some for we appreciate it is being brought about largely because of improved machinery, making it possible for fewer people to produce the food and the material for clothing that this nation needs. It is one way to balance up industries and get them on a comparable basis.

Changed conditions constantly cause human beings to readjust themselves and many have to go through severe hardships. No one likes it, but as long as we continue to develop and improve methods of production, distribution, and transportation, there will be this constant adjustment to keep the various prices in proper relationship.

To us the chief trouble with agriculture is due to overproduction and one way to solve it is to have fewer people producing agricultural products.

HOW TO BUY CHEAP

It is just as important to know how to buy well as to know how to sell well. The farmer who is always on the alert to buy advantageously and at lower prices is usually the one who makes money.

There are many ways of securing commodities needed on the farm at lower prices than are charged by merchants when the products are taken through the usual channels. Some years ago we pointed out the advantages to dairy farmers of buying feeds, fertilizers, coal, and other things collectively through local dealers and in car lots. When these products are bought in carload lots, it takes just a little planning to get a sufficient number to take a full carload and be ready to unload the car promptly when it arrives.

So few people figure that it costs a merchant money to unload a car of any commodity and store it that they neglect to go to their merchant or to their co-operative and find out just what saving could be affected if they would pay cash and take the product home direct from the car. Many communities have made arrangements to carry on this kind of merchandising and farmers find they can save enough to warrant them to pay cash and haul their products direct from the car to their own storage places. Some dealers deliver from the car to the farm. They can give the farmer a better price when he buys this way than when the merchant stores the product.

It is not difficult to figure out the number of tons of coal you will have to buy for next winter, or how much feed or how much of anything else. Then make arrangements with your neighbors to obtain a sufficient quantity of any product to make up a carload.

ORGANIZATION ESSENTIAL

The real purpose of a co-operative organization is to determine what the market demands and how much it can use at a fair price, to provide methods of handling surplus, to grade and advertise its wares, and to get producers to act and work together.

Mr. A. D. Allebach, President of the Interstate Milk Producers' Association, Philadelphia, enumerated before a meeting of the Pure Milk Association of Chicago a few things which his association has done and its accomplishments have been most satisfactory. He, in part, said:

"Our greatest accomplishment was to reduce the surplus milk on the Philadelphia market from 35 to 10% and so adjust production to meet demands. Back in 1919 we learned that we had to produce more milk in winter and less in summer if we expected to get a fair year around price. We decided to penalize the fellow who didn't maintain a level production throughout the year. We went out and held ninety meetings in thirty days among the dairymen to explain why they must equalize production."

It should be noted here that they went out in the territory supplying milk to Philadelphia and held ninety meetings. They didn't simply hold conferences in Philadelphia, appoint committees, and then adjourn.

Mr. Allebach also said, "We joined the National Dairy Council, started a two-cent per hundred pound checkoff paid jointly by the producers and dealers, and raised $100,000 to advertise milk and other dairy products in Philadelphia. The association sought to gain the confidence of the dealers. It succeeded. At the same time it realized that if the price for milk is set too high, milk from remote territory will flow in and the market will be demoralized. We also established a quality control department, wrote its own rules and regulations, and hired thirteen men to go out and enforce them. All this required money, but it paid."

The Interstate Milk Producers' Association of Philadelphia is successful and renders its members a splendid service. It has taught the producers market requirements and what must be done to meet them. Producers with such understanding will not continue to produce more than the market will consume at a fair price, or will they turn over their products for the speculator to play with. Through organization they have become masters of their own business and by following sound business practices have raised the price of their product.

PRICE FIXING STOPPED

Some time ago the co-operative creameries of New Zealand formed an organization for marketing their butter. The Control Board fixed prices and the results have been rather disappointing. The United States Department of Agriculture in its market report for April 28 gives the following information which should be of value to those who think the solution of the agricultural problem lies in the farmers becoming organized so they can fix the prices of their products.

"A development of outstanding importance in the foreign situation as affecting United States markets is the abandonment of price fixing by the New Zealand Dairy Produce Export Control Board. This step was taken on March 14 after a combination of unfortunate developments forced upon the Board at least a temp change of policy.

"The difficulties met by the Control Boa back to the strike of British seamen durin fall and winter of 1925-26 which did mu break up the shipping schedule of the Boa most at its inception. The result was a s accumulation of stocks at the peak of las son's production. Scarcely had the depressi fluence of these accumulations been ove when the general strike in Great Britain in 1926, followed by the prolonged coal m strike, depressed the English butter and markets. It is not surprising, therefore, tha understanding of the effects of control s have arisen, with the accumulation of su and depression in prices being attributed l to the policy of the Board.

"Since the middle of March the new pr has involved the releasing weekly of a porti the accumulated and available stocks for s competitive prices. The quantity proposed released weekly up to the end of June is 9 boxes or some 5,000,000 pounds. It is state cially that the stocks in London on Mar amounted to 23,327,000 lbs. of butter an 120,000 lbs. of cheese. The published progr the Board for the allocation of present su together with those produced through th mainder of the season provides for the dispo all accumulations in London of butter by th dle of June and of cheese somewhat earlie

MORE COWS FROM GOOD SI

It is not enough for dairymen to feed, and protect the health of their cattle in th approved manner. It is of considerable i tance to know whether the average prod from year to year is going up or down. might, by the right feeding, increase the p tion of his herd 15 to 20 per cent and at the time daughters of these cows by the use poor bull may be reduced as much or more.

The value of a grade dairy cow is almost e ly measured by her milk production; the va a pure-bred is measured by production, typ the known production performance o ancestors.

How good a bull must a dairyman have daughters are to produce more than their The answer to this question depends on t erage level of production of the dams.

To partially answer this question the Bur Dairy Industry has compiled some records o and daughters from cow testing associati ports. The records include grade and pur cows, a total of 4,364 yearly records. The r of grade cows and their daughters are co separately from those of pure-bred cow daughters.

From these figures it is shown that when t erage production of grade dams reached 3 of butterfat, the average bull mated with cows failed to get daughters whose prod exceeded their dams.

The records for pure-bred dams show that their average production reached 394 lbs. o terfat, the pure-bred bulls mated with such failed to get daughters capable of producing than their dams.

The owners of grade and pure-bred dair tle with such records are forced to sear proven sires if the production of their herd be maintained or increased.

Thus cow testing association records are able not only as a means of eliminating cows, but also as a basis for selecting good

When dairymen more generally recogni importance of this, methods of finding the k sires needed and of using them more intelli will become a permanent part of our progr improvement.

Brown or Green Alfalfa Hay

e time ago an article in Hoard's Dairyman that alfalfa hay that has browned in the s just as good for dairy cows as the pea- hay. Would this be equally true of alfalfa or feeding hogs? What advantage does al- neal have over the hay for feeding cows and

le Cedar, Iowa. L. W. W.

y of our readers claim they get just as good better results from feeding the browned al- nay to cows as from the pea-green hay. In- ly they report that the browned hay is more ble. This assumes, of course, that the com- n is made between hays of equal quality as ness of stems and proportions of leaves and ne only difference is in the color of the hay uenced by the method of curing and storing. lfa hay is valued particularly for its protein, l, and vitamin content. The method of cur- d storing has little influence on the protein ineral content of the hay. It may have con- le influence on the vitamin content of hay.

n the standpoint of protein, carbohydrates, nd minerals, there is no evidence to indicate ne pea-green hay or meal is better for hogs he browned hay of equal quality. From the oint of vitamin content there is some evi- that the method of curing hay influences its value. Not enough work has been done on oblem, however, to support a positive state- Such work as has been done indicates that ch direct sunshine and weathering tends to vitamin A, the one that promotes growth ng animals and effects a certain measure of protection in mature animals. On the other considerable direct sunshine seems to pro- he retention of vitamin D, the one that pro- mineral (calcium and phosphorus) assimila- his vitamin seems to have a greater relation irect sunshine than with the factor of color , although it is generally thought that the en hay is richer in this vitamin than the d hay. This is not necessarily true because ssible to have pea-green hay without much sunshine, in which case the hay would be vitamin D and good in vitamin A.

h of these two vitamins one should strive erve depends somewhat on the other feeds ration. If one feeds liberally of yellow corn lage made from yellow corn, it is thought e requirements for vitamin A are adequate- . Generally there is a greater probability leficiency of vitamin D in the ration than of which case it is probably more advisable to ay with a maximum of vitamin D in it. As indicated, pea-green hay does not neces- mean an abundance of vitamin D but rather uirement is for plenty of direct sunshine in the hay. There is no evidence to indicate e method of storage has any marked influ- these two vitamins.

ther one should feed alfalfa meal instead of depends on the price of hay compared with eeds, on the quality of the hay particularly ards coarseness and such other factors as use cows to waste hay, and on the cost of g.

n hay of equal quality, there is little evi- o indicate that it pays to grind the hay for nd aside from convenience in feeding, this is true for hogs, particularly with hay low , fine in stems, and with a goodly portion of ves retained. On the other hand, coarse d hay offers some inducement for grinding y the waste is greatly reduced. Coarse stemmed hay that has lost a considerable portion of its leaves should not be fed to hogs. There is a greater need for grinding hay for hogs than for cattle because of their limited capacity to include roughage in the ration and because of their preference for the finer parts.

Tuberculin Does Not Cause Tuberculosis

Can a cow contract tuberculosis from the tuberculin which is used to test her? I have been informed that cattle which are tested every year get infected from the same.

Fort Atkinson, Ia. A. K.

As tuberculin contains no live tubercular germs, it cannot cause a cow to contract tuberculosis.

Tuberculin is a product prepared by sterilizing, filtering, and concentrating the liquid upon which the live tubercle bacilli have been allowed to vegetate. It contains the cooked product of the growth of the bacilli, but not the bacilli themselves. It is impossible for tuberculin to contain any living tubercle bacilli since it has been heated to 212° and then is run through a filter. It is merely a clear, tea-colored liquid containing the by-products of the tubercle bacilli, and a portion of the content of the cells.

The process of manufacture of tuberculin shows very clearly that it cannot cause tuberculosis. There is further reinforcement of this from the fact that many herds have been tested annually for tuberculosis and no reactors discovered. The Hoard's Dairyman Farm herd has been tested annually for over twenty-five years, and since the first infection was gotten rid of, there has not been a single reactor in the herd except one reaction that took place some five years ago. This same condition has been reflected in a great many other herds.

Variation in Test

On March 3 one of my cows freshened and on the visit of the cow tester on March 19 he gave her a month's record of 1,380 lbs. milk testing 3.6 per cent, or 49.7 lbs. fat. I thought she ought to test more, so took a sample of her milk to the creamery two days later and the test showed 4.7 per cent fat. Could there be this much variation in test in two days when a cow receives the same feed and care? How much will cows vary in test from year to year?

Wisconsin. J. C. S.

A variation of 1 per cent in test is not usual with cows, although this does happen occasionally. It is frequently difficult to assign a cause for this variation in test, as there are a great many factors that influence the test of milk and they are not readily recognized. Sometimes when a cow comes in heat she will raise her test very materially, and again her test will decline. The same holds true of sudden changes in the weather, exposure to cold, sudden changes in feed, and a variety of other things. There is, of course, the possibility that either the sample in the first case was not taken correctly or that it was not tested correctly, or that an error was made in sampling or in testing the second time. It is quite possible to make an error of this kind, and we would not condemn the tester unless we were in a position to note a repetition of careless methods in doing his work.

While the above named causes are most usually assigned, yet with our present knowledge of the physiology of milk secretion we are unable to connect these variations with their particular cause. As Professor Haecker says, "Surely the ways of the cow are very strange."

Some years ago the Michigan Station studied 270 records made under ordinary herd conditions where regular feeding and milking were practiced, together with 2,070 records of official Advanced Registry tests. From the data thus secured the following conclusions were drawn: One may expect that during 7 consecutive days about 30 per cent of a herd of cows will show a range in the percentage of fat in the milk at different milkings of one per cent or less; 50 per cent will show a range of 1.1 to 2 per cent in fat; 14 per cent will show a range of 2.1 to 3 per cent; and the remaining 6 per cent of the herd will show even greater variation. In other words, six per cent of the cows might yield milk testing 3 per cent fat in one milking during the week, and at some other milking produce milk containing 6 per cent fat.

All of this does not answer the question propounded, and we very much doubt whether the question can be answered. It is quite like a question that might be asked as to why the famous baseball player, Babe Ruth, is able to make several home runs in one game, and on the following day fans out every time he comes to bat. These changes have been known to come when the same pitcher was in the box and when the weather conditions were apparently the same, and when Babe himself seemed to be in his usual physical condition. The fact remains that this does happen, and more often than not a reasonable and positive answer can not be given.

About all that we are able to say at the present time is that the fluctuation in the composition of the milk from the same cow is much greater and more common than is often assumed. Why it should be so, science has as yet been unable to say, although many men have sought to explain it.

A cow will average to test very much the same from year to year, the general tendency being to raise the test slightly until she is mature and then to have the test decline. In individual cases, however, this varies from the normal but it is seldom that the widest variation would amount to more than one per cent.

We give below the average annual tests of twelve cows in the same herd that have been in a cow testing association for four years or longer:

Cow No.	Average yearly test at						
	2 yrs.	3 yrs.	4 yrs.	5 yrs.	6 yrs.	7 yrs.	8 yrs.
	%	%	%	%	%	%	%
1	4.6	5.0	4.8	4.8	5.0	4.6	4.5
2	5.1	5.8	5.1	4.9	5.0	5.1	4.6
3	4.4	4.9	4.8	4.1	5.0	4.9	
4	4.9	5.2	5.4	4.9	5.3	4.7	
5	4.6	4.5	3.5	4.1	4.1	4.3	
6	5.9	6.2	5.6	5.5	5.5		
7	4.8	4.5	4.4	4.6			
8	4.9	5.2	4.9	5.3			
9	4.9	4.6	4.5	4.1			
10	5.4	5.9	5.5	5.0			
11	5.7	5.6	5.1	4.8			
12	5.0	5.3	4.8	4.6			

While some of the variation noted above may be due to the varied efficiency of the several testers employed, yet we are inclined to think it is fairly representative of conditions that may be ordinarily expected. It will be noted that the widest variation takes place in the case of cow No. 2 that tested 5.8% as a three-year-old and only 4.6% as an eight-year-old. The next highest variation was in the case of cow No. 5 that varied from 4.6% as a two-year-old to 3.5% as a four-year-old. We do not understand the reason for this extremely low test as a four-year-old.

Plowing Under Straw

Kindly let us know the fertilizing value of a ton of oat or barley straw. Does it contain more plant food than barnyard manure? When is the best time to spread this straw, right after threshing or is it better to let it decay? Would there be any difficulty in plowing it under? We use an ordinary walking plow.

Hathaway, Minn. A. F.

A ton of mixed barnyard manure will contain about the same amount of fertilizing constituents as will a ton of oat or barley straw. However, the fertility elements in the manure are more readily available and will show, in general, better results.

Unless the amount of straw on hand is very largely in excess of needs, we would prefer to make use of liberal quantities of it for bedding as it will handle easier in this manner and it will also help to make the fertilizing elements in the straw more readily available for plant growth. However, straw may be spread right after threshing and this is preferable to allowing it to stay in the stack and rot down. When allowed to decay in the stack too large a part of the fertility and humus value of the straw is lost. If the straw is spread on stubble, it will plow under very well, if it is allowed to weather down. This holds particularly true if allowed to stand over winter.

Indeed, there may be a decided advantage in spreading straw lightly over clover or alfalfa fields as well as winter grain. This will help to give protection against the alternate freezing and thawing which does damage to these crops. If spread on hay land it might be desirable to rake up the straw in the spring, but a considerable portion of it will have been broken up and have become incorporated in the soil. The rest may be either used for bedding or spread on the fields or put in the barnyards for the cows to tramp.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Dairy Cattle Congress Judges

Secretary Estel of the Dairy Cattle Congress announces the following judges for the 1927 show: Holsteins, H. H. Kildee, Iowa; Brown Swiss, C. S. Rhode, Illinois; Jerseys, C. H. Staples, Louisiana; Guernseys, W. W. Yapp, Illinois; Ayrshires, L. V. Wilson, Minnesota.

News From Washington, D. C.

[Special to Hoard's Dairyman.]

Washington, D. C., May 25—The record of the proceedings of the Dairy Pilgrimage of the American Dairy Federation was completed and mailed out to those who registered for the pilgrimage. A small supply is available in addition to this, and may be had at a cost of one dollar each.

The annual loss of nearly $25,000,000 worth of milk bottles broken, lost, or stolen, and never returned to the distributors of milk who supply them, is reported. A suggestion was recently made to Secretary Hoover, of the U. S. Department of Commerce, that it might be possible to materially cut down this loss and waste, which finally comes out of the producer of milk, if all milk bottles could have a warning blown into the bottle in color, red for example, requesting that the bottle be preserved and returned to its owner.

Dr. C. W. Warburton, chief of the extension service of the U. S. Department of Agriculture, who has been detailed to the Mississippi flood area to assist the Red Cross work, is home and reports great trouble to the farmers whose losses have been especially heavy in destruction of their stock of feed and work stock and of small animals. In most of the flood area, he states, swine and poultry are a complete loss. In Mississippi in particular cattle, horses, and mules were destroyed in large number. In the other flood areas, except Louisiana, which is now in the crisis of its flood situation, horses and cattle were nearly all saved.

In this connection Dr. C. W. Larson, chief of the Bureau of Dairying, reports that the flood is very certain to sweep over the Department of Agriculture Dairy and Animal Industry Station at New Iberia in sufficient volume so that all employees and all animals must be removed, if this is possible. There is danger of great loss at this station, for not only will most of the experimental work be interrupted and largely lost for the year, but owing to the fact that the territory around New Iberia is largely tick infested, while the station there and all of the herds on it are tick free, the removal is likely to cause infestation with ticks which is certain to result in severe losses later on. Dr. Larson at the time this is written was in strong hope that some location, perhaps as far away as Eastern Texas, could be secured to which the dairy stock could be moved in carefully guarded trains and where they could be kept in tick-free area until the flood waters recede. He investigated various fair grounds and some big ranches which had been suggested as properly guarded from ticks as to be safe for this purpose.

The dairy industry continues its interest in tariff matters and during the past week or so two dairy cases now in the hands of the Tariff Commission have been moved forward another step toward final settlement. The final report in the Swiss cheese investigation has been completed and sent to the White House for the action of the President. No announcement has been made from the White House as to whether he will recommend the increase in the tariff. The milk and cream case field data has been completed and is being tabulated and checked up preliminary to the final public meeting.

Reports of oleomargarine production for the month of April, just made available by the Bureau of Internal Revenue which collects the tax, show that production jumped upward sharply for this month. Colored oleomargarine went from 915,000 lbs. for April last year to over 1,000,000 lbs. in April this year, while for uncolored the figures are as follows: April, 1926, 19,529,000 lbs.; April, 1927, 22,236,000 lbs.

T. B. eradication work is going forward in fine shape, according to the monthly report from the B. A. I. There are some black spots on the T. B. map, however; New York, for example, having but four T. B. free counties, while Colorado, Connecticut, Maryland, Massachusetts, New Hampshire, New Jersey, and Washington are real dairy states which have not a single accredited county. North Carolina holds high record with 34 free counties, with Michigan and Iowa next with respectively 34 and 30 accredited counties.

Like to Embroider?

In our June 25 issue we will run a complete color page describing articles stamped for embroidery which you can purchase through the Hoard's Dairyman Fashion Department. Kitchen curtains, vanity sets, children's dresses, aprons, buffet sets, luncheon sets, runners, and pillow cases are definitely described so that you will know just what the articles are. Remember these articles are ready for use as soon as you embroider them. Watch for our June 25 issue.

be Cow County of the East

D'S DAIRYMAN:—Oswego Coun- Y., under the leadership of unty farm bureau, has per- an organization for the pur- f fostering an intensive five- dairy improvement program, is aimed to make this county lly known as "the Cow Coun- the East." A county Dairy ement Council has been which has general charge of ogram. The principal project start will be the Dairy Im- ent Club, a unique form of sting association which has been in operation for the past three years and which it is expected through this effort will be largely expanded. One means of centering attention on this work will be the selection each year of three master dairymen who will be awarded prizes of $100 each to be used for a trip to the National Dairy Show, and suitable recognition for all 300-lb. herds.

Since the announcement of this program, the membership of the Dairy Improvement Club has increased over 50 per cent. An important feature of the program is to be the holding of a Field Day each year. The purpose of this Field Day is not only to provide an enjoyable outing and to maintain the interest of the dairymen in this program, but also to bring home to the residents of the towns and cities of this county the importance to them of a prosperous dairy industry.

The first annual Field Day is to be held on Wednesday, June 29, at Kingsford Farms, Oswego, N. Y. The speaker of the day will be Hon. L. J. Taber of Ohio, Master of the National Grange. A sale of pure-bred bulls bred in the county is another feature that is attracting wide attention among the dairymen. Oswego County is one of the pioneer communities in the United States in the breeding of Holstein cattle and the herds of the county number over 50,000 head, practically all of which have been tuberculin tested. There are within its limits over 1,000 fully accredited herds, so that there is every opportunity for far reaching results from the dairy improvement program started.

New York. M. S. PRESCOTT.

Body by Fisher

FAMOUS EVERYWHERE for Endurance and Thrift

Although lower prices and larger, more beautiful bodies by Fisher have created wildfire interest on the part of new thousands of buyers—

—the worldwide success of today's Pontiac Six is largely based on those two great fundamentals which made it the most popular car of its type ever introduced. *And those two fundamentals are endurance and thrift!*

You can drive your Pontiac Six all day long at full throttle speed—because from headlamps to stop light the car is constructed to endure the most pitiless uses—because its engine is the largest used in any six selling up to $1,000 and all other units are designed up to that standard.

You can travel rough and rutty roads in perfect confidence—because every detail of the car was proved by three years testing on the great General Motors Proving Ground.

And when you have occasion to check back on upkeep costs, you will be amazed. For the Pontiac Six was designed to deliver quality six-cylinder transportation at the lowest cost in history. And it wouldn't be winning its present success, if that were not the case!

Improved
FISK
Balloon Cords

A patented process, known as "*Fillerless*" Cord—which does away with all cross-strands and puts an equal strain on each cord—enables Fisk to build greater *comfort*, greater *safety* and greater *mileage* into Fisk Cords.

The thick tread of the Fisk Balloon Cord is designed to give sure traction, steady braking, easy steering and unusual protection from punctures on all cars, under all weather and road conditions.

There is a tire for every need—in type, size or price—in the Fisk line.

There is a Fisk Tube for every tire, a standard gray and circle made extra heavy red. To get the most out of your tires, use Fisk Tubes.

What is a Good Cow Worth?

HOARD'S DAIRYMAN:—When one attends a sale of pure-bred dairy cattle you will see many a man shaking his head and saying, "Too much money. They are not worth it." Perhaps the next day the same man will be at a scrub sale and buy some mongrel of unknown ancestry for $50. Perhaps his neighbor bought one for $175 at the pure-bred sale. Who got the best buy?

Last fall a member of the Long Prairie C. T. A. of Minnesota purchased a pure-bred Holstein cow, bred to a grandson of King Piebe, for $175. Was she worth it? C. T. A. records say she was. In 192 days since freshening she has produced 364 lbs. fat. At the average price of 58½ cents a pound paid by the local creamery the product is worth $213.17. As she had a bull calf which was sold for $100, her total return was $313.17. The feed cost was $100, leaving a profit of $213.17. In 192 days this cow not only paid her board but paid for herself and gave her owner $38.17 besides. She has 173 days to go before her year is up, so she will show a handsome profit for the year.

Suppose this man had considered $175 too much and had gone to another herd in our association and bought the best cow in the herd for $50. The best cow in this herd produced 187 pounds fat and showed a profit above feed cost of $51.20 for the year. She had a calf by an inferior sire worth, perhaps, $20 and making $71.20 return above cost of feed. Deduct the $50 paid for the cow and we have a profit of $21.20 a year on the $50-cow. How does this compare with the profit of $38.17 in 192 days on the $175-cow? Which cow is the cheaper?

It isn't the price that is paid, but the returns we get. Let C. T. A. records be the guide, both in buying and in selling.

B. J. ROSENQUIST, tester.

What We Put In

HOARD'S DAIRYMAN:—The members of the Genesee—Eagle Association of Wisconsin feel that we have passed through a long feeding period and are looking forward anxiously to pasture time. Many of them, owing to the early fall and late spring, are getting low on both silage and hay. I think that in general there is a much smaller carry-over of both these things than there has been in several years.

It has been a good winter, however, for the dairyman who has had to buy his grain, as prices have not been out of reach and the price of milk has remained up fairly well.

If more farmers could be brought to realize, "That we get out of a cow only what we put in," there would be a great deal less of the great cry that many of them put up, "There is no money in dairying."

The cow can be compared to a locomotive standing on a railroad track. It may have steam in its boiler; we pull the throttle but the engine stands still. Why? Because there is only enough steam to maintain heat,

ld not enough to give the proper essure to make the wheels go and. It is just the same with the w, she may get feed enough for her dily maintenance, but she must also ve enough besides this to make her lking wheels go round before she is e to produce to the extent of her pacity into the milk pail.

The dairymen must wake up to the t that today things are different n in years gone by and that if he to make a success of the dairy siness he must study each individu- cow's needs and feed her accord- ly.

A good cow, if given the right e and treatment with the proper ount of feed in the form of a anced ration, will take care of the k-pail end of it without any worry the part of the dairyman.

GEORGE KING, tester.

ndiana Winners for 1926

During the year 1926 approxi- tely 8,000 cows in 24 Indiana cow ting associations completed a r's record of 9 months or longer. announcing the high herds the rec- s are divided into two groups. For se herds containing 4 to 9 cows, t place goes to Lyman Metzger the Fulton Association whose 5 lstein cows averaged 521.6 lbs. . For large herds those with 10 rs or more, Oscar Erni of the rk—Scott Association takes first ce with his 14 Jerseys showing an rage of 451.7 lbs. fat. Jacob cks & Son have the honor of own- the high cow, a pure-bred Hol- n that produced 728.3 lbs. fat.

How to Keep Alive

ordon C. Dana, tester for the Ke- ha C. T. A. and president of the consin Testers' Association, sug- s the following program for test-

Take the Guess Work out of Dairying!

JOIN THE ROCKFIELD COW TESTING ASSOCIATION

We don't keep Cows Cows keep us

ADVERTISING THE C. T. A.

The Rockfield Cow Testing Association stirred up interest in testing by means an auto windshield sticker as shown ve. The printing is in red on the mmed side of a sheet of paper 5" by 9".

to use in keeping alive interest in association:

Hold regular monthly meetings all members present. Have the meeting an attractive "pep" ting and mixer, combined with an testing program.

Plan a picnic during the summer all members and their families, ing friends and neighbors. es, amusements, and refresh- ts to be furnished—prizes fur- ed by local merchants for all ers of contests. It creates inter- and keeps the crowd in good or.

Tester should arrange to hold a testing association exhibit at the county fairs. Give demonstra- tions on milk testing to show the variation in test. Make your own charts showing different cows' records, different practices, and benefits of C. T. A. membership.

4. The tester may distribute state bulletins and circulars pertaining to dairy farming, etc., also U. S. Dept. of Agr. bulletins. Bulletins in stores, schoolhouses, and on farms throughout the locality give the impression that "Those fellows in that C. T. A. are doing things." It keeps this "cow testing" before the eyes of the public.

5. Rubber stamps should be made up and each bulletin stamped. Suggested stamps are as follows, the tester's name and address to be added:

Join A Cow Testing Association
And Make More Money
With Less Cows and Less Work
— Ask Us About It —
C. T. A.

Take Guess Work Out of Dairying
Join A
Cow Testing Association
Do It Now
Feed the Good Cow Better—
Sell the Boarder

6. Hold a "Farm Tour Day" for all members and friends in the fall when the heaviest work is over.

Have notices printed on post cards giving full particulars and urging everyone to attend, also have notices printed in all the local newspapers. The cars should all meet at a certain place at some definite time and then drive in a body to the different C. T. A. members' homes. Study the other fellow's way of doing things.

7. Monthly reports on the following:

Five high herds. List all cows producing over 40 lbs. butterfat.

Give some of the grain rations that were fed, etc.

Write reports on activities for local newspapers.

Give publicity when it is due; but do not overdo it.

8. By all means put out a good printed annual report. It will not be an expense to you but may prove valuable for your future job.

Montana Gets Results

HOARD'S DAIRYMAN:—Does the cow testing association get results? This is easily answered by noting the marked increased in production of the Lewis and Clark Cow Testing Association, Montana. This association was organized in February, 1926. The association average for that month was 604 lbs. milk and 21.8 lbs. fat for 330 cows. In December of the same year 373 cows were tested with an average of 713 lbs. milk and 28.3 lbs. fat. In April of this year 364 cows were tested, with an average of 797 lbs. milk and 31.0 fat.

These figures should prove very conclusively that herds are improved in a comparatively short time, when the farmers find out really what their herds are doing and decide that the poor cows must go.

HENRY JACOBSON, tester.

Tom Tarheel says that his alfalfa field is the most popular place on the farm with the live stock and chickens.

*cludes dry cows. †Retest rules followed.

Getting the Good out of Grass

is easy. All you need do is turn your cows on it when it gets to the right stage, and feed a good grain ration night and morning.

There's a lot of good in fresh June pasture. It makes cows feel better and stimulates their milk flow. It's a tonic. But it positively will not produce a good milk yield alone because it has not enough of the necessary proteins, fats and carbohydrates.

This year, feed grain right through the pasture season. A simple ration will do and it is not necessary to feed heavily. The following inexpensive ration will bring your herd through the Summer in good condition and produce enough extra milk to more than pay for itself:

250 lbs. DIAMOND CORN GLUTEN MEAL
400 lbs. Bran — *Analysis:*
300 lbs. Ground Oats — 20% Protein 4% Fat
50 lbs. Hominy — 8½% Fibre

A WONDERFUL SUCCESS

"Nothing succeeds like success," they say, but where success is constant and increasing there must be some unusual merit back of it. The continued success of the **Auto-Oiled Aermotor** is based entirely on merit. It has been made better and better year after year. Improvements have been added as experience has shown the way. The **Auto-Oiled Aermotor** of today is a wonderfully durable and efficient windmill.

The Aermotor Company, more than 12 years ago, solved the problem of complete self-oiling for windmills in such a way as to make the system absolutely reliable. The oil circulates to every bearing and returns to the reservoir with never a failure. There are no delicate parts to get out of order. The double gears run in oil in a tightly enclosed gear case.

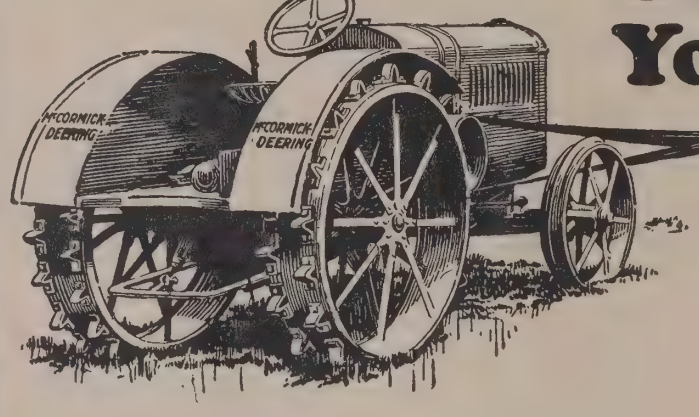
Fetching the Cows

HOARD'S DAIRYMAN:—It has come—the month of June; the lazy cowbird is hopping about the bluegrass pasture looking for fat grubs and newly-hatched grasshoppers; the cowpath has little pools of water made by the afternoon shower and a barefoot boy squirms the soft mud between his toes as he journies to the far end of the pasture to fetch the milk cows home for the evening milking.

A striped gopher scurries along a little padded trail through the thick green grass and dodges into a hole that it has dug beside a cedar fence post. In a moment it reappears whistling saucily at the intruder. The boy produces a neat coil of binder-twine from his pocket and as soon as the gopher disappears again, sets his snare, then lays flat on his stomach in the cowpath and waits. His eyes watch intently the dark shadow by the cedar post that marks the gopher's burrow. In a few moments he sees the grass move and then the tawny colored nose and head appear. He can see the large, beady, black eyes blinking in the sunlight. Puckering his lips he blows a tremulous, whistled call. The gopher's head jerks back only to reappear in a moment, this time well above the burrow. Cautiously the boy's fingers tighten on the twine, then a quick jerk and the snare tightens. The boy springs to his feet and swings the helpless gopher clear of the ground, cutting a wide circle through the air and stunning it as it strikes with a thud against the hard bank of the cowpath. In another minute he crushes the life from i body, pulls a horn-handled jack-kni from the depths of this same pock cuts off the gopher's tail, returns t knife and snare and tail to the poc et, glances over his shoulder at t sun and continues on his way fetch the cows.

The path leads on down the h to the edge of the marsh. Here t coarse grass is knee-deep. A stran croaking noise comes to the bo ears. He stops and listens; th picking up a short stick, carefu parts the grass and searches until finds a snake holding, half swallow in its jaws, a bullfrog. With quick, carefully aimed stab he p the snake to the ground with the e of the stick, then taking the forel of the bullfrog in his fingers, gen releases it from the jaws that h held it in their death grip and dr it in a puddle in the cowpath, t continues on his journey to fetch cows.

At the far end of the pasture he fi some of the cows lazily curling th long tongues around great mouthf of green, sweet bluegrass. Others lying contentedly chewing their c in the shade of the wild crabap trees and a couple are drinking cool, fresh water that comes bub ing from the hillside spring.



Sweet, succulent, nutritious fe fresh, cool drinking water; warm s shine and cool shade; a soft, c fortable resting place; ideal co tions for dairy cows and our sighs as he looks at the full, diste ed udders of these cows as he dri them back along the path to the b He is thinking that it will be s job to pail his three again this ning. It has been a job for a w past. But then, he muses, it w last long. The flies will soon c and the sun will get scorching and the bluegrass pasture will b brown and the hillside spring will dry. These same cows won't more than half as much milk by middle of July.

Ten years later our boy has ished his course at the agricult college and is back working the home farm. One of his chief cerns and, in fact, a main factor tributing to his success, is furnis June conditions for his dairy throughout the twelve months of year.

Illinois. J. S. NAYL

Drawbar, Belt, and Power Take-Off—
Ample Power for all Jobs at all Times

Don't Underpower Your Farm!

Invest in 15-30 Three-Plow Power

USE liberal three-plow power! Don't overlook the many good, sound, practical reasons why you are investing in tractor power. You want to do much more work with the same or less labor expense. You want to handle each field, each crop, each job faster. You want to extend your farming operations in various directions, do each job at the right time, cut down weather risks, etc.

Be prepared for the many new calls for power—drawbar, belt, and power take-off—that may come along during the next few years.

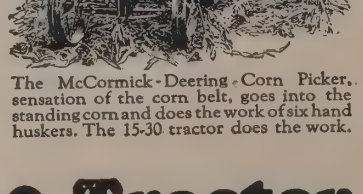
The man who replaces horses with a small tractor is taking a big step forward. The man who goes to the three-plow tractor at once is getting himself ready for power farming on a broad scale, and for profit. He can also add to his income by outside field work, threshing, silo filling, grinding, shelling, sawing, baling, and hauling. He can do road work for the community. He can earn hundreds of dollars a year by custom work with the 15-30.

"Please accept my thanks for equipping me with a 15-30 McCormick-Deering. The smaller tractor gave me good service, but the 15-30 is much more economical, working at a greater saving in man hours as well as fuel. I do not see how I could handle my farm on a paying basis without the McCormick-Deering."

E. A. STAMBAUGH,
Green Park, Pa.

In the long run the McCormick-Deering 15-30 tractor is cheaper to buy than the two-plow tractor. It is able to earn *extra* money so easily. On the well-handled farm the extra cost is often returned to pocket in a single season, and then the liberal power of the 15-30 goes on making a profit for its owner in the proportion of three-plow to two-plow. When you buy your tractor, go into this thoroughly. Look the 15-30 over at the dealer's store.

INTERNATIONAL HARVESTER COMPANY
606 So. Michigan Ave. of AMERICA (Incorporated) Chicago, Illinois



15-30 Power Advantages

ALL along the line the McCormick-Deering 15-30 *adds 50 per cent to the day's work of the smaller tractor without adding to labor costs!* A 3-furrow strip instead of 2; 12 acres plowed per day instead of 8; 30 acres double-disked as against 20. Time is saved, labor is saved, work is increased, and costs are reduced in every season.

The 15-30 will handle threshers, ensilage cutters, etc. with greater efficiency and profit. In grain and corn harvesting, 15-30 power is *essential* for power take-off operation of the *harvester-thresher* and the *corn picker. Be ready in the future to handle new equipment such as these two important modern machines.*

The McCormick-Deering Harvester-Thresher saves 20 cents per bushel over old methods in the harvesting of grain. It requires 15-30 power.

The McCormick-Deering Corn Picker, sensation of the corn belt, goes into the standing corn and does the work of six hand huskers. The 15-30 tractor does the work.

The Three-Plow 15-30 Tractor
McCORMICK-DEERING

Iron in Nutrition

That the iron content of mil not influenced by feeding ra high or low in iron is shown by experimental work by Elvehjem, rin, and Hart of the Departme Agricultural Chemistry, Unive of Wisconsin, reported in the Jan Journal of Biological Chemistry.

Two experiments were cond with milk goats. In the first ex ment the oxide of iron was fed creasing amounts until the iron was five times as much as wa ceived by the animals fed a base tion and used as checks. There w influence on the iron content o milk.

In a second experiment with iron sulphate was used up to times the iron content of the ration. It did not increase the content in the milk.

A third observation was ma an analysis of milk of cows fe tions varying in iron content. T tion for one group of cows pr twice as much iron as another for another group of cows, yet was no difference in iron conte the milk from each group. It w served, however, that the perce of iron in the milk of cows fe same ration varies greatly.

National Guernsey Sale—$84,350

THIS year's national sale was held on the beautiful state fair ground at Trenton, N. J., May Guernseydom packed the ring- before the gavel of George Bain led the crowd to attention. Sev- y-six animals were sold, averaging 109.86. Competition was keen all ough the sale, the first ten to pass ough the ring averaging $591.64 l the last ten $784.50.

The ten bulls averaged $1,655. ngwater Peter Pan topped the les with a figure of $8,600. He s consigned by John Ames and chased by Frank B. Foster of nsylvania. Ralph Flynn of Pitts- gh was runner-up. Peter Pan is ub's Prince, consigned by W. W. Marsh, Iowa, went to Harry Bailey, New York, for $4,300. Altogether 29 animals sold for amounts reaching four figures.

The general consensus of opinion was that the sale was a mighty good one. Buyers and consignors seemed very well pleased and many of the veterans spoke very highly of the offering.

The national sales of each breed are an important event in every year's history. The keenness of the competition reacts throughout the entire United States. We believe that careful scrutiny in selecting animals for future auction sales will help both the breed and the consignors more than is estimated.

The Center of Attraction at The June Wedding

So far as being noticed is concerned, there might as well not be anybody but the bride at the wedding. It is how she looks that counts, and whether her clothes and settings are right or not that make or mar the day.

Nothing delights me more than to be asked to help at a wedding. Even if I were told that my work was nothing more than peeling potatoes or some other back door job I wouldn't mind, just for the joy of being where all the happy bustle is going on. Yet when the ceremony gets along to a certain point, when I see the bride standing there looking so happy and trusting and the groom looking so reliable and fine, I always have to begin saying quickly to myself "Hey diddle diddle, the cat and the fiddle: the cow jumped over the moon," and keep it up furiously until the final "Amen" has been said. If I didn't say that or something else foolish, I would be sure to spoil the whole thing by weeping for there is something about the solemnity of the thing that always makes me have to look away—or else take the responsibility for breaking up the party.

But back to the bride and her clothes. I saw one the other day and the instant my eyes fell on her that hackneyed expression loved of school girls flew to my mind—"just too darling." Really, she was the prettiest thing imaginable, yet she herself was only an ordinarily pretty girl but she was fresh complexioned and tall and slender and very sweet and she had on the dress of all dresses for her. She had wanted for her wedding dress something that she could wear later for parties and simple affairs—just a good, practical dress. So she had chosen bride's gray taffeta and made it with a perfectly plain, close-fitting bodice, a very full skirt gathered on at a low—but not too low—waist line, and long, close-fitting sleeves. The thing that made the dress was what looked like a perfectly straight piece of sheer, white organdie laid in lengthwise folds about three-eighths of an inch deep that went around her neck and clear down the front of her waist line being crossed there and fastened with a silver bar pin. Demure, quaint—she looked like a modern bride for John Alden. Gray kid slippers with gray stockings and a hat of cornflower blue completed this lovely effect.

If you don't like gray for a wedding dress, the same idea could be carried out in any other color; only remember that taffeta is not a material that can be worn by just anyone. You must either be tall and slender or else short and dainty; otherwise taffeta is not for you.

But satin, that gorgeous fabric, is for anyone and if you want a formal wedding, creamy white satin with a lace veil is the loveliest thing there is. White satin is not nearly so useable afterwards as is most any other material, so if you want a practical dress it is well to choose something else.

Weddings are becoming more and more simple and veils are worn only with the conventional wedding gowns. Tulle veils are charming and inexpensive but very perishable; it is only the good lace veil that you can keep and hand down from generation to generation.

With practically all except the white satin dress, hats are worn and surely there never was a time when a bride had so good an opportunity to find a hat that would make her lovely to look at.

The smartest looking brides—except of course the extremely wealthy—are those who buy only a few dresses and have the correct things to go with them. It is much better to have two stylish, well-made dresses with the proper shoes, stockings, and accessories than to have half a dozen dresses with such accessories as take away all the smartness of the costume, for styles are such today that the wrong things, even with the right dress, throw the whole effect out of joint.

I would urge every bride to have her underwear simple, plain, and dainty. Once in Chicago I went into a shop where nothing but underwear was kept and there I discovered that all the much-trimmed, fussy garments were the cheap ones while the ones whose price fairly took my breath were simple almost to the point of severity but elegant in the fineness of their material and making. The same is true of negligees.

If the bride is so fortunate as to be going on a trip, nothing is smarter than a two-piece suit with pretty blouses. Unless, however, she can have all three things, it is better to sacrifice the suit and get a pretty dress and top coat as these fit into many more occasions than does the tailored suit.

The bride who pays attention to her color combinations is going to look much better dressed than she who buys a thing because it, in itself, is pretty and becoming. For instance, a tan hat, however lovely, does not go well with a gray dress and I think a good general basis for the selection of colors might well be either what goes well with tan or else what goes well with gray.

Always, however, there is the consolation that if mistakes have been made a happy bride looks pretty to everyone and her devoted groom, wearing his rose-colored glasses as all devoted lovers should, will think her pretty in anything she puts on.—LUCY THOMPSON.

When to Put Down Eggs

No one would just as soon have stored eggs as fresh but along about Thanksgiving and Christmas when fresh eggs bring more than at any other time of year, it is a mighty handy thing to have some to sell as you can if you have stored some earlier in the year. Fresh eggs sold then will purchase a good many odds and ends and you are not really cheating your family because there are plenty of places where stored eggs will answer just as well as fresh in cooking.

Spring and early summer is the best time for storing eggs because they are then most plentiful and will bring least if sold. Unless it is possible to watch the nests carefully and make sure the eggs are strictly fresh, it is best to candle them. The equipment for this is easy to make and costs nothing. Take a shoe box or one similar and cut a hole in one side about the size of a half dollar. Slip the box over a lamp or electric light, darken the room, and hold the egg, large end up, in front of the opening. A lantern is probably safer than a lamp and in either case ventilation must be provided by cutting holes in the top of the box.

A good egg, held before the opening, will look clear and firm. The air cell, or white spot at the large end of the egg, should be small, not larger than a dime, and the yolk will be seen dimly in the center of the egg. If the egg appears black or very dark it is not fit for use.

According to the poultry department at the University of Wisconsin the two best methods of preserving eggs are in lime water and water glass, used in earthenware crocks or wooden pails. Ten quarts of solution in a five-gallon jar will preserve 15 dozen eggs.

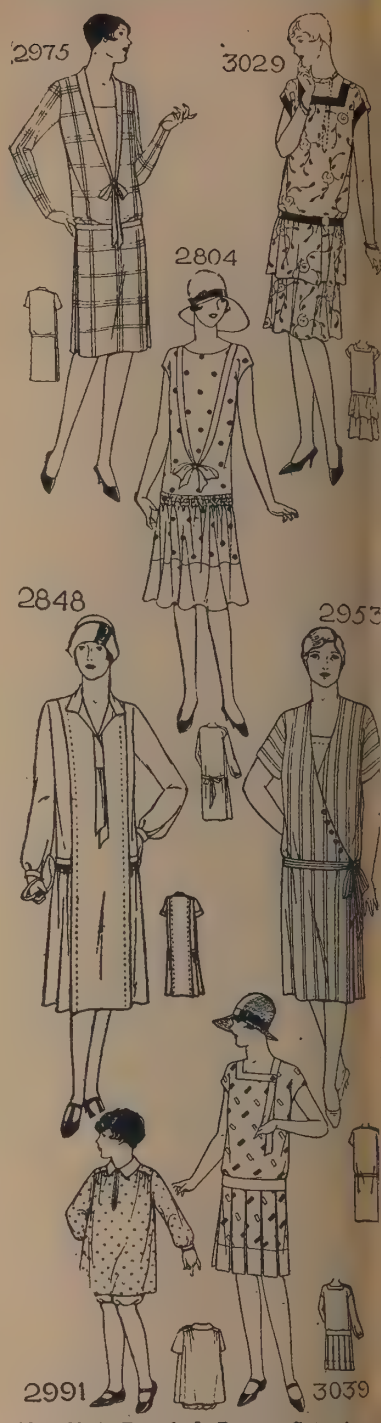
In using water glass the proper proportions are one part liquid water glass to nine parts of boiled water which has been allowed to cool. Stir the mixture thoroughly, pour it into the crock or pail and put in the eggs. Water glass in powdered form is more reliable than the liquid form if directions on the package are followed.

If you use lime take two pounds of quick lime and slack it in a small amount of hot water; mix this with two gallons of water and add a pound of salt. Stir thoroughly and allow to settle. Pour off and use the clear solution. This amount is sufficient for about 12 dozen eggs. Neither the lime nor the water glass solution is good for more than one year.

Stored eggs should be kept in a cool place, preferably the cellar, and the tops of the eggs should be covered with several inches of liquid. If this evaporates, add water.—LUCY THOMPSON.

Summer Style Book Ready

It is Later Than Our Spring and Summer Book



Send today for our Summer Style Book. You will find it contains patterns for summer clothes which are fashionable and easy to make. Costs only 10c. Fashion Dept., Hoard's Dairyman, Ft. Atkinson, Wis.

Tongue-twisting Chemical Protects Silks and Woolens

Paradichlorobenzine! It's hard on spelling contests, but sure death for moths.

Housewives may always win when playing hide and seek with moths. Grandmother played the game successfully when she wired and brushed her stored woolens and silks several times during the summer. But the modern housewife may store her winter clothing, bedding, or rugs early in the spring and forget them until fall, according to C. L. Fluke of the Economic Entomology Department at the Wisconsin College of Agriculture. A

Miscellaneous Fashions

No. 2975—Practical Dress. Cuts in s 16, 18, and 20 years, 36, 38, 40, 42, and inches bust measure. Size 36 requires yards of 40-inch material with ⅝ yard of inch contrasting.

No. 3029—Particularly Wearable. Cuts sizes 16, 18 years, 36, 38, 40, and 42 in bust measure. Size 36 requires 4¼ yard 40-inch material with ½ yard of 40-inch trasting.

No. 2804—Afternoon Dress. Cuts in s 16, 18 years, 36, 38, 40, and 42 inches measure. Size 36 requires 2½ yards of inch material with 1 yard of 40-inch trasting.

No. 2848—Slender Lines. Cuts in sizes years, 36, 38, 40, 42, 44, and 46 inches measure. Size 36 requires 3⅝ yards of inch material.

No. 2953—Morning Dress. Cuts in s 18 years, 36, 38, 38, 40, 42, 44, and 46 in bust measure. Size 36 requires 3½ yard 40 inch material with ¼ yard of 6-inch terial for vestee.

No. 2991—For Playtime. Cuts in sizes 6, and 8 years. Size 4 requires 1⅝ yard 40-inch material with 1 yard of 36-inch trasting.

No. 3039—Swagger Sports Dress. Cut sizes 8, 10, 12, 14, 16, 18, and 20 years. 8 requires 1¾ yards of 36-inch material ¾ yard of 40-inch contrasting.

How to Order Patterns

Enclose 10c in stamps or coins (wrap carefully) for each pattern ordered. your order to Fashion Department, Ho Dairyman, Fort Atkinson, Wis. Every tern is seam-allowing and guaranteed t perfectly. Do not fail to state size.

Our patterns are made especially for u the leading fashion designers of New City. No stock of patterns is carried in office and, since all orders are forwarde the factory, kindly allow a reasonable for delivery of any pattern you order.

Something to think about: Eve fish wouldn't get caught if it kep mouth shut.

It Destroys Bacteria

STERILAC is used as a disinfectant to destroy the bacteria which make milk and various other food products spoil. Even disease organisms which are dangerous to health are destroyed with STERILAC.

Keeps Bacterial Count of Milk Low Through the use of STERILAC all external sources of contamination are controlled with the result that milk is produced having a minimum bacterial count.

Sterilac Keeps Milk from Spoiling To insure good keeping qualities milk prepared by the STERILAC method is immediately cooled below 60° F. Such milk is safe to use as food for infants and children.

In Demand Good, wholesome milk is always in demand. The STERILAC method of producing milk will help you to secure a good market for your product. It will help health officers provide citizens wholesome milk low in bacterial count.

Sterilac is Reliable You can depend on STERILAC as an aid to produce milk of the highest quality. STERILAC is just as valuable in creameries, cheese factories, ice cream factories, restaurants, hotels, butcher shops, hospitals and homes. It helps to keep these places scrupulously clean and provides every requirement of sanitation.

Sterilac Does Not Taint STERILAC is a chloramine substance which is an improvement of the Dakin preparation known to destroy bacteria, yeast and mold. It does not taint milk nor impart an odor. While STERILAC is powerful it is safe to use as a disinfectant. Even if some of the STERILAC solution should come in contact with milk or other food products it could not spoil them as food for humans. That is why STERILAC is safe to use and makes milk, etc., safe food.

Sterilac is Sold as Powder STERILAC is sold only in the form of a powder. There is no loss in strength on standing. Even STERILAC solution will keep for a long time without losing much of its strength. The cost of STERILAC is small compared with the enhanced value of the milk and other food products that are produced through its use as a sanitary agent.

Special Introductory Offer

of enough STERILAC to make 60 gallons of the strength used for ordinary sanitation $1.00. Complete directions enclosed.

Send a dollar bill today.
A trial will convince you.

North Chicago, Illinois

tight trunk or box in which to pack the garment after it is aired and brushed is one good safeguard. A cedar chest is good, but it will not destroy the eggs that may be on the garment.

Some chemical must be used to destroy these eggs. Fluke suggests paradichlorobenzine which may be bought from an insecticide dealer or a drug store. This is the same white crystalline substance which is used in some parts of the country to kill the peach borer. It has a strong odor, something like moth balls or naphtha which will disappear very quickly when the article is aired.

Paradichlorobenzine may also be used in a closet in which there are moths. If the door is kept closed for two or three days, clothes may again be hung in it with perfect safety.

When moths get into the davenport or upholstered furniture, the only successful way of getting rid of them is to fumigate. However, this must be done by someone skilled in the use of fumigants, Fluke warns. Using a vacuum cleaner regularly will help to keep them from doing much damage.

Washing the Family Woolens

I feel sorry for men and for women who do not do any house work for they will never know the joy the rest of us feel when we suddenly decide that "this is the very day to wash up all the wool things—sweaters, knit caps, blankets, and so on—and put them away for the summer." It sounds like an awfully commonplace way to get a thrill but I never go through this process that I don't get a big one.

Many people who know what they are talking about claim that woolens should always be washed by hand so as to insure gentle handling but life is too short for that in this busy world and I always do mine in the machine and get practically as good results. The really important things to consider are, I think, the temperature of the water and the drying.

It is best to start with the white and light-colored blankets and go right down the line of colors. Of course if there are any delicate baby things they should be done first by hand. Take warm, not hot, water and make a good suds by adding mild soap that has been shaved and melted separately in a kettle of boiling water, run the machine just long enough to make sure all the dirt is out and then rinse in tepid water. Changing from the warm wash water to a cold rinse makes wool harsh.

Experts usually call for "several" rinse waters. I find that two rinsings give splendid results and I know that no one wants to do any more work than is necessary to get things right. Besides, woolens are fluffier if not all of the soap is rinsed out and the really expert way to do is to rinse and rinse until every bit of the soap is out and then rinse again, adding a bit of soap to the final water.

Wringing is another disputed point. The very most particular people squeeze the water out of woolens but never wring them and that is undoubtedly the way to do with delicate things, but when it comes to blankets and the rough-and-ready sweaters I just put them right through the wringer and I am sure you would never know the difference.

Drying is something you can't be too careful about and any knitted garments like sweaters and play suits should be spread out on something clean on the floor, stretched to the proper size and shape, and left to dry that way, turning them once or twice a day. Such garments as these may be put on hangers to finish drying. When it comes to blankets, I think the nicest way is to fold them with the hems together and pin the hems to the line using plenty of clothes pins to avoid a scallopy edge. A day of not too hot sun and a gentle breeze is ideal for drying them.

When you pack these things away, I hope you have a little scent of some kind to put in with them—not perfumery, of course, but a bag of balsam needles, or one of mint—or lavender—anything that will soak through and through them as they lay through the summer in their box and give them that clean, delicious smell of nature that no French perfumer has ever been able to imitate. —LUCY THOMPSON.

A Word for Plenty of Tomatoes in the Garden

If mothers realized the value of tomatoes I don't believe there would be a child in the world who would say to me as one did yesterday, "I just can't bear the old things." Early training will make any child like tomatoes and even grown people can learn to relish them if only they want to.

There seems to be almost no end to the good things we can say about this sturdy old vegetable friend (I still continue to think of tomatoes as vegetables, though painstaking friends have pointed out patiently that they are really fruits.) They are cheap, easy to grow, they contain the vitamins A, B, and C in addition to containing the minerals we need for keeping in good health—lime, iron, potash, sodium, and so on.

Many persons feel that they must avoid tomatoes because they are acid but the truth is that these very acids are valuable aids in keeping the stomach and bowels in good condition. Tomato juice is being fed with the finest results to small babies and many physicians are using tomatoes as a food treatment for diabetes.

Ordinary cooking does not injure the vitamins in tomatoes as it does in some foods so the housewife who looks far enough ahead to plant a good crop of them will be able to can enough for the family supply until the next crop comes. We have always raised our own and I have had practically no trouble with my canned ones spoiling though I put them up by the open kettle method. The reason for this, I believe, is that I always use only the perfect ones and can them as soon as they are picked.—LUCY THOMPSON.

To a Sweetheart

To learn to drive the auto, dear,
First put the lever into gear,
Then push your left foot in like this,
That's fine. Now teacher gets a kiss.
Now, step upon the starter, so;
That makes the engine go.
Now, let your left foot back, like this,
Good! Teacher gets another kiss.
Upon the gas you now must step,
That fills the engine full of pep.
That's great! You are a clever miss,
Here teacher gets another kiss.
Now change to second; now to high,
You do that just as good as I.
Now stop the car right here and then
We'll do that lesson once again.
—Connecting Rod.

To a Wife

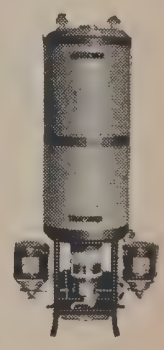
First, see if your car is out of gear,
How? By this gear shift lever here.
How can you tell? Why, feel it. See?
The thing is simple as can be.
Now step on that to make it start,
Great Scott! You'll tear it all apart
If you don't take your foot off quick
The second that it gives a kick.
Now throw the clutch. For goodness sake!
Your clutch! Your clutch! No, not your brakes!
Why? Cause I tell you to, that's why.
There, now, you needn't start to cry.
Now put this lever into low,
Step on the gas and start off slow.
Look out! You almost hit the fence!
Here, let me drive. You've got no sense.
—Connecting Rod.

Hot Water

from the

kitchen pump

HOT water for "washing up"! Our new method makes it easy. Connect a Perfection Kerosene Water Heater with your well or cistern. Simply light a burner—turn a small handle—and pump hot water. (Turn the handle back and you pump cold water.)



Plenty—Quickly

All the hot water you want, any time. 5 minutes after you light the heater, there's hot water for washing up or shaving, in 10 minutes enough for washing the dishes, in 30 minutes plenty for a hot bath.

The heater can be easily connected, too, in homes which have water pressure.

Not Expensive

Four models—reasonably priced. Two have thermostats which put out the flame when the tank is hot. One has a 30 gallon "Stay hot" tank. Keeps water hot for 36 hours. They all burn kerosene—the cheap fuel.

This is the model with the 30 gallon tank. No. 431

This Machine and One Man Puts Up The Hay

Sandwich Easyway Loader

Farmers call this *Easyway* the "One Man Hay Loader," for they tell us one man can make a big, full load. In this *Easyway*, inventive genius has made a loader that combines the *Cylinder* and *Push Bar* actions. This is one of the many exclusive features found only in the *Sandwich Easyway Loader.*

You've never seen a machine like it. The *Easyway* cuts down labor cost and farm machinery costs too.

The Cylinder gently lifts the hay from swath or windrow without change or adjustment. Steady work—no scattering—no broken clover or alfalfa heads. You get *all* the hay, better hay, and *all* the feeding value.

The Push Bars force the hay up and push it far onto the load. Thus less help and labor are required where this combined loader—two machines in one—is used.

Ideal Loader for Alfalfa and Clover. Solid Deck. We fit the *Easyway*, when wanted, with a solid deck which prevents the alfalfa and clover heads and leaves from being wasted by falling down through a slatted deck to the ground.

These other extra features of the *Sandwich Easyway Loader* mean much to you,—Adjustable Wagon Hitch, Flexible Tongue, Light Draft, works on even or rough ground, handles swath or windrow, does not dig up the ground, durable and lasting, works fine on alfalfa. There are over seventy years of manufacturing skill behind it.

Write to us and say, "I want full information on *Easyway Hay Loaders.*" We'll send you our interesting book FREE. Or go to your dealers; see this great machine. You'll never see another like it.

NEW!

Startling Facts On Summer Feeding —just off the Press!

Mail The Coupon For Free Booklet

Years ago, summer feeding of dairy cows seemed simple as A-B-C. Plenty of pasture—why spend money for other feeds? But today there's a big change. Practical, prosperous dairymen now feed concentrates to stock on pasture.

How? This booklet tells you. Why? This booklet gives you the scientific reasons. It's packed with readable, usable information — tells you how to make more money this year by feeding Linseed Meal with a summer grain ration — to your milking herd, also to other stock. A proved success — yet a brand new story to 99 farmers out of 100. Mail the coupon for your copy.

A Vest Pocket Herd Book is a good investment

Seasonable Live Stock Notes

ON May 12 we took a trip into the country to encourage the reorganization and continuance of a cow testing association. A few herds of cows were already on pasture; many more were casting eager eyes from muddy barnyards towards the oncoming green of fields waking up from a long winter's sleep. 'Tis now a month later; anticipation has been realized; green grass and bright sunshine have dissipated the memory of dry feed, hard floors, and the monotony of being tied in one place continuously. Pastures are in their prime over a large portion of the land where dairy cows contribute a substantial part of the farm income. A prime pasture in June does not necessarily mean one as good in July or August. How to properly supplement the deficiencies of pastures during the next two months is an important problem that should be considered carefully by many dairymen.

How Much Grain

We have numerous inquiries on the amount of grain and the kind of a mixture to feed cows on pasture. C. H. Eckles of the University of Minnesota makes the following recommendations as to the amount of grain to feed when pastures are good:

Guernsey or Jersey producing: 20 lbs. daily, 3 lbs. grain; 25 lbs. daily, 4 lbs. grain; 30 lbs. daily, 5½ lbs. grain; 40 lbs. daily, 8 lbs. grain.

Holstein, Ayrshire, or Brown Swiss: 25 lbs. daily, 3 lbs. grain; 30 lbs. daily, 4 lbs. grain; 35 lbs. daily, 5½ lbs. grain; 40 lbs. daily, 7 lbs. grain; 50 lbs. daily, 9 lbs. grain.

As pastures become more mature, less abundant, and less palatable the several amounts should be increased.

The mixture used may be very simple. One composed of 200 lbs. each of ground corn, oats, and barley or 300 lbs. each of any two of these plus 100 lbs. of bran and 100 lbs. of either linseed meal, cottonseed meal, gluten feed, or soy bean meal is very satisfactory.

How Do You Exercise Your Dairy Bull?

There is an increasing indication that some of the difficulty in getting heifers and cows to conceive may be charged against impotent bulls. Of necessity these animals are given less freedom than almost any others on the farm. That this close confinement and lack of exercise contribute to the delinquency of such animals has been fairly well demonstrated. How to give the bull plenty of exercise and at the same time safeguard members of the family and live stock sometimes attacked is a problem that has not been entirely and satisfactorily solved. We solicit the experiences of those who have solved this problem. How are you exercising your bull this summer?

Cull the Poor Sows Now

No herd of hogs can be maintained on a high plane of breeding performance unless the owner constantly culls the inferior animals. The best time to require an accounting of the individual sows in the herd is right now after the pigs are weaned. Only those sows which have produced good-sized, even litters of pigs and suckled them well should be retained for another breeding season. Sows with defective teats, cross sows with mean disposition, pig killers, and poor milkers should go to the fattening pen. The "best looking" sows will likely be numbered among those that should be culled out for the very simple reason that the really good sow has just finished suckling a large litter of pigs. She is a good milker and does not spare her body to make her owner proud of her pigs. She is the kind of a sow to keep.

Treating Chicks for Worms

The early hatched chicks are now feathered out enough to be following their inherited instinct of going higher and higher on the roosts. They are trying their wings. On such farms as are heavily infested with worm eggs, and if nothing has been done to prevent them, chicks are likely to show symptoms of being badly affected with worms. Light weight, unthriftiness, drooping of the wings, leg weakness are symptoms of such a cause. The tobacco treatment is recommended for growing chicks. Mix 49 lbs. of the dry, growing mash used with 1 lb. of tobacco dust. Feed the mixture for 2 weeks and then omit it for 2 weeks and repeat the tobacco feeding for another 2 weeks. This may be continued throughout the summer. Do not mix more of the mash and tobacco than will be consumed in a week. In other words keep the mixture fresh.

Grain for Dairy Calves

A recent inquiry propounded the question of grain mixtures for dairy calves on pasture. Since this is the beginning of the pasture season an answer to the question is timely. Let us limit "calves" to those over three and under 12 months of age. Calves under three months should not be made to depend on pasture grass for roughage; feed hay. As long as

JERSEY COW, JOVIAL'S PRINCESS

In 365 days she yielded 10,759 lbs. milk, 700.83 lbs. fat in Class AA, thus winning a gold medal and the championship of Florida. She is owned and was bred and tested by the Southern States Lumber Company at Magnolia Farm, Florida.

sonable amount of skimmilk is , 12 to 15 lbs. per head daily, on ture the grain may consist of any of a combination of ground corn, s, barley, or kafir grain. There is need for protein supplements from in sources. The skimmilk and ss supply plenty of good quality tein as also mineral substance. ne experimental evidence indicates t after calves are 5 or 6 months they prefer whole grain. A calf months old getting skimmilk and ss needs about 2 lbs. of grain ly. This should be gradually in- ased to 4 lbs. at 6 months of age. here skimmilk is not available it is visable to increase the protein con- t of the grain mixture by increas- the proportion of high protein ncentrates. A good mixture may made from 200 lbs. each of ground rn and oats, 100 lbs. of bran, and) lbs. of linseed meal.

The above indicates that I had a abor income of $2,093. My cash ving expenses were $1,105 and to his must be added the $486 listed as arm credits toward the family living, r a total of $1,591. This shows that got ahead $502 in 1926. I believe ay labor income should be at least 4,000 per year to compare with like ffort in the city.

SOUTHERN WISCONSIN.

Echoland Herd Averages $283

The Echoland Holstein herd, wned by Dr. Egil Boeckmann, White Bear, Minn., was dispersed at uction May 5th. The average, $283, vas considered very satisfactory un- ler the circumstances. No testing ad been done in the herd for years nd only two of the cows had records nd these were old.

Top price was $1,400, which was aid by Carnation Farms for the Echoland herd sire, Echoland Sir Romeo. This bull is a yearling show ull by Sir Romeo Mildred Colantha nd from Lizzie Pietertje Ormsby, a 36-lb., 1,017-lb. 3-year-old daughter of Sir Pietertje Ormsby Mercedes. The runner-up on this bull was L. C. Lenth of Iowa. Another yearling bull, a son of the show heifer, Bess Fayne Maid, sold for $600 to the Iowa State Institutions, represented by Senator A. M. McColl.

The top female was Lizzie Pietertje Ormsby that sold for $500 to Senator McColl. She was handicapped in that she was ten years old and off in the udder. She is still a wonderful individual and safe in calf.

The sale was under the management of the Melin—Petersen Company, Minneapolis, and the selling was done by Mack, Hanson, and Tellier.

Top animals and buyers were as follows:

Carnation Milk Farms, Wisconsin	
Echoland Sir Romeo	$1,400

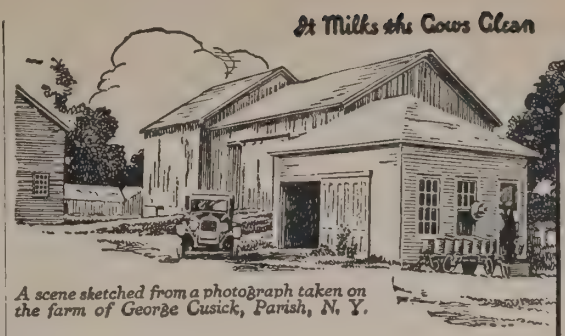
The Standard Milk Ordinance

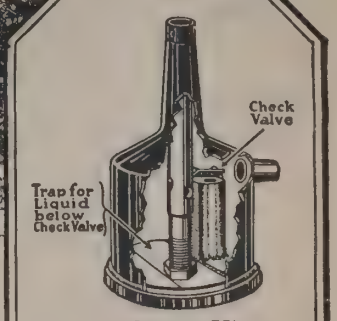
HOARD'S DAIRYMAN:—In your issue of April 25, 1927, I notice an article written by C. H. Staples, Louisiana State University, opposing the Standard Milk Ordinance. It is not my intention to enter into the discussions that have existed between Mr. Johnson of West Virginia and Mr. Staples of Louisiana but I do seriously object to Mr. Staples' statements regarding the merits of the Standard Ordinance. He makes the statement that certain organizations and state departments in Louisiana have gone on record as being opposed to the standard ordinance because it is "entirely too stringent, theoretical, experimental, and non-enforceable."

The Arizona State Board of Health, the State Dairy Commission, the Dairy Department of the University, and almost the entire dairy industry of the state have gone on record as favoring the standard ordinance because it is NOT what Mr. Staples says it is. W. S. Cunningham, head of the dairy department of the University of Arizona, made the statement a few days ago before the Arizona State Dairy Inspectors' Association that the Standard Ordinance is the biggest thing that has ever come into Arizona in the way of a milk control program. From one end of the state to the other the dairy industry has either signed petitions or gone in person before the city councils and asked them to pass the ordinance. In only about three instances has it met opposition by a few dairymen.



As for it being "highly technical" it is simplicity personified. It is a merit system that gives a dairyman credit for what he does to safeguard his milk supply. There is nothing in it that a dairyman can not do if he wants to. The dairymen here like it because it is fair, practical, and just to them—something they have not found in other milk ordinances. And the public likes it because it gives it protection in a way that other ordinances do not.

I feel justified in making the statement that anyone who opposes the U. S. Public Health Service Standard Milk Ordinance is either badly misinformed or knows nothing about milk control work. I feel further that any municipality in America that has an opportunity to operate under this ordinance and does not, is doing a great injustice to both its dairymen and consuming public.

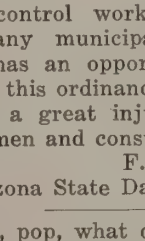


F. R. JENNINGS,
Arizona State Dairy Commissioner.

Say, pop, what do you call a man who drives an automobile?"

Father: "It all depends on how close he comes to me."

A scene sketched from a photograph taken on the farm of George Cusick, Parish, N. Y.



Cross-Section View
Burrell
Sanitary Moisture Trap

This Feature Is Essential For Low Bacteria Counts

"It is easy to make clean milk with the Burrell Milker. I consider the Burrell Moisture Trap absolutely essential for the production of clean milk and low bacteria counts. I supply the village of Parish and have to have milk of low bacteria count."—*George Cusick, Parish, N. Y.*

IN all milkers, the space in the pail above the milk is filled with vapor during milking. Some of this vapor is drawn into the tube leading to the vacuum pipe line. There it condenses and becomes contaminated, and, if allowed to flow back into the pail, it contaminates the milk. No ordinary check valve or trap will prevent this—but the Burrell Moisture Trap *does*.

It Skims the Milk Clean

For many years, the wonderful Link Blades of the Burrell-Simplex Cream Separator have made it famous as the *closest skimmer*. It has a greater capacity for the size of its bowl, for the speed at which it is operated, and for the power required to run it than any other separator. It is simple, light and easy-running. But, above all, *it skims the milk clean*—and that's what you want in a cream separator. Four sizes—350, 500, 750, 1000 lbs.—hand or power driven.

It Prevents Contamination

The Burrell Sanitary Moisture Trap catches any condensed vapor which flows back from the pipe line. The check valve, being located above the liquid in the trap, prevents an inrush of air from carrying this contaminated liquid into the pail. The Burrell Sanitary Moisture Trap is a necessary safeguard against high bacteria counts.

4 Exclusive Features

There are four exclusive features which make the Burrell the *perfect* milking machine. The first three are interdependent—each increases the efficiency of the others. (1) The *Automatic Controller*, which regulates the suction to suit exactly each individual cow; (2) the *Air-Cushion Teat Cup*, which supports and compresses the teats by air alone; (3) the *Positive Relief Pulsator*, which gives complete rest between pulsations and assures natural circulation; (4) the *Sanitary Moisture Trap*, which entirely prevents contamination from the pipe line.

The Burrell Milker is noted for its simplicity. It is a single tube system, with only half as many rubber parts as the ordinary type of milker.

Send For Valuable Free Books

Here are two valuable, illustrated books that are free to dairymen. One pictures and describes the Burrell Milker and explains how "*It Milks the Cows Clean*". The other tells about the Burrell-Simplex Cream Separator—all about its simple, sanitary, rugged construction, and how "*It Skims the Milk Clean*". Every dairyman should have both of these interesting, practical, helpful books for handy reference.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

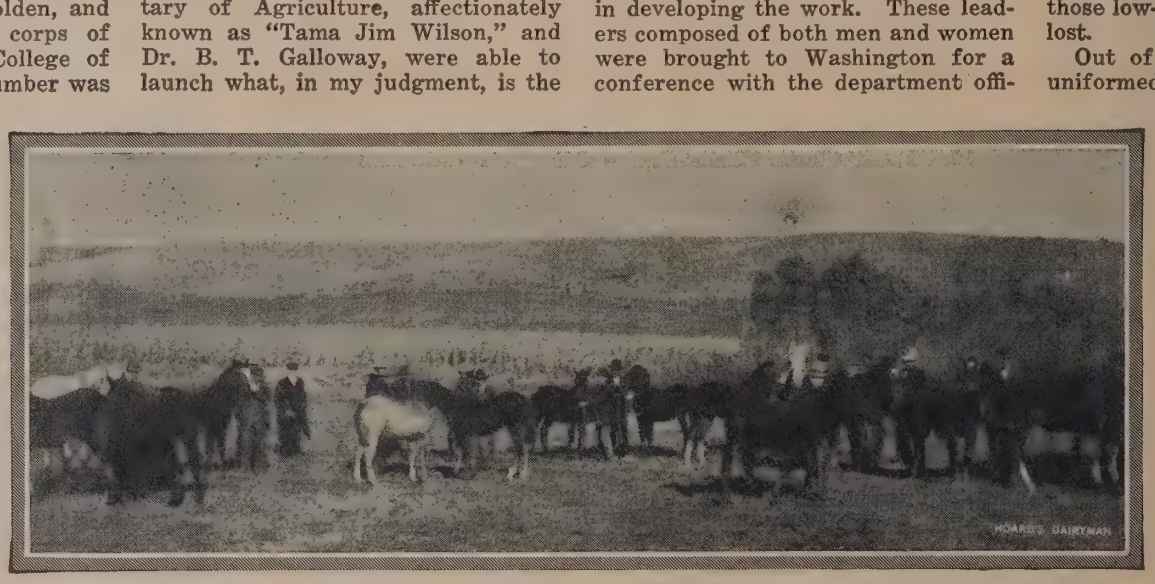
The Origin, History, and Use of the 4-H Club Emblem

[EDITOR'S NOTE: This is the second and concluding article by O. H. Benson on the early history of 4-H club work. In the first article, featured in the Junior Department of the preceding issue, he told the origin of the 4-H idea, why and how he introduced 4-H club work into the rural schools of Wright County, Iowa, nearly a quarter of a century ago, and where the 4-leaf clover emblem came from.]

DURING the 5 years of leadership in the Wright County schools we had a number of distinguished visitors who not only gave us inspiration and re-enforcement, but also gave us many valuable ideas for which we have ever been grateful. Some of these men were Dr. A. E. Winship, America's bishop of modern education and editor of the Journal of Education; Uncle Henry Wallace, editor of Wallace's Farmer; Prof. Perry G. Holden, and his fine corps of workers from the State College of Agriculture. Among this number was Professor R. K. Bliss, the present Director of Extension—without the help of the Extension Department of the College of Agriculture we never could have carried the work forward—Mr. Herbert Quick, editor of "Farm and Fireside" and member of Roosevelt's Country Life Commission; Senator Jonathan P. Doliver, who not only visited the county but helped secure bulletins for instruction in the work; Otis E. Hall, Indiana's Consolidation School Expert and County Superintendent of schools in Indiana; Mr. Hall later became one of our state club leaders in charge of 4-H club work in Kansas and is now one of the ablest leaders in4-H club work in the United States, and, by the way, the highest salaried county club leader in the world. Many other men came to see our work and brought inspiration and ideas.

O. H. BENSON

4-H Emblem Becomes National



In February, 1910, the writer moved to Washington, D. C., and became a leader of boys' and girls' club work of the United States Department of Agriculture and assisted the famous Dr. Seaman A. Knapp in initiating club work in the southern states.

The agricultural extension work had already been under way in the South as a boll weevil control program under the Bureau of Plant Industry with Dr. B. T. Galloway as its chief.

The boys' and girls' club and county agent work was under the leadership of Dr. Seaman A. Knapp, assisted by his son, Dr. Bradford Knapp, now president of the Oklahoma College of Agriculture and a number of other men including myself, O. B. Martin, former State Superintendent of Public Instruction of South Carolina, together with a number of able field agents. These men, backed by the enthusiasm and vision of our Secretary of Agriculture, affectionately known as "Tama Jim Wilson," and Dr. B. T. Galloway, were able to launch what, in my judgment, is the greatest piece of constructive education and field service work ever given by the Department of Agriculture, namely, 4-H club work, with boys and girls as the hope of rural America.

RURAL TEACHERS AND LEADERS IN 4-H CLUB WORK, OF WRIGHT COUNTY, 1907, IN A NAIL DRIVING CONTEST

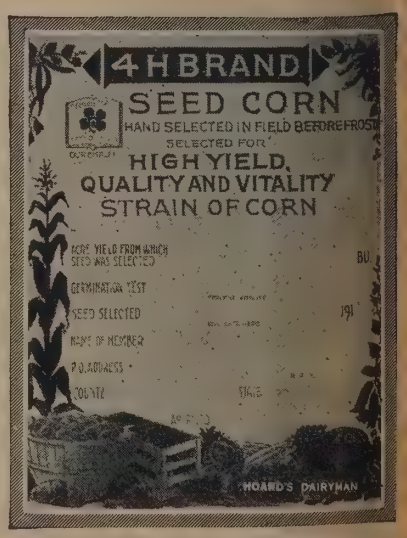
A 4-H COLT CLUB IN A TOWNSHIP CLUB FAIR AND FESTIVAL, EXHIBIT AND JUDGING CONTEST

While the extension work was still confined to the southern states and most of the funds provided by the Rockefeller Foundation, a few state and county club leaders were employed to assist the department staff in developing the work. These leaders composed of both men and women were brought to Washington for a conference with the department officials. It was at this conference that a committee was appointed to design and recommend a suitable emblem or insignia and medal for boys' and girls' club work. The Wright County 4-H club emblem and its explanation was submitted to the committee for its consideration with the result that this first group of government, state, and county leaders adopted the 4-H emblem as the insignia for this remarkable piece of work known as the 4-H club work. It is possible that few, if any, in that first conference really knew the origin and previous use of this emblem in the Wright County, Iowa, schools and I am sure that no one in that historic assemblage had ever been told anything about the birth of the idea and that it had really come out of the heart and hands of rural childhood while standing in the sunlit clover field of an Iowa countryside.

It is interesting to note that nearly every great movement has a small beginning and that most of our great ideas of education have their source and birthplace in the life and needs of childhood.

The Boy Scout Movement

Seventeen years ago, an American journalist, W. D. Boyce, of Chicago, in his tour around the world embarked from the boat in the early morning to the streets of London and was immediately enveloped in one of those low-hung London fogs. He was lost.



Out of the fog stepped a dapper uniformed English boy scout. He saluted the American and said, "Sir, is there anything I can do for you?" To this the American replied, "Yes, show me the way to the hotel." The scout stooped, picked up the bags from the hands of the traveler, and led the way to the hotel and to the room clerk's desk.

Stepping aside, the scout stood in salute while Mr. Boyce signed the register, then he turned to the scout and said, "I thank you, young man, for your help and courtesy" and reached in his pocket for a coin and offered the boy a liberal tip. The boy stepped back, saluted the American and said, "I thank you, sir. *I am a Scout.* This is my *daily good turn* and *a scout accepts no pay for daily good turns and courtesies.*"

This was an unusual treatment o

A 4-H CORN CLUB EXHIBIT TENT ON COUNTY FAIR GROUNDS AT CLARION, IA., SEPTEMBER, 1908. ARROW POINTS TO MR. BENSON

A 4-H BRAND SEED CORN LABEL USED IN WRIGHT COUNTY WHEN MR. BENSON WAS COUNTY SUPERINTENDENT

American traveler in Europe and urally led Mr. Boyce to an investi-ion of Scouting. He asked the to tell him all about Scouting. To s the boy replied "Come and see Chief, Sir Robert Baden Powell. will tell you all about it." Mr. yce did go to see "Sir Robert" and a result, Mr. Boyce brought back our shores the Boy Scout move-nt.

Not only in its service to city boys by the creation of a Rural Scout partment, the 4-H club work with lessons of thrift, ownership, and ter practices in agriculture, the m boy, like the city, may have the ining of this greatest of boy or-nizations of the world and through oath, laws, preparedness training, ly good turn, and scout craft, may a truth develop the 4-H training head, heart, hand, and health.

Today on a public square in the y of London stands a bronze statue a buffalo awarded by the Boy outs of America to the Unknown glish Scout, who through his daily od turn sent out of a London fog message of scouting to the boys America.

Over 3 million boys have been ined in scouting since 1910. To-y we have 800,000 boy scouts, 0,000 men friends representing ev-y walk of life who are the scout-sters, council members and other unteer leaders of boys in scouting is quite possible that this service d training for boys might have en denied to American youth had t the English scout demonstrated daily good turn.

Thousands have helped develop 4-club work as it is today, including n and women of national affairs, icials of state and county, preach-s, teachers, and business men, but r the inspiration for the idea as apped up in the 4-H emblem we e our thanks to the group of eleven rm boys and girls who through eir bouquet of good luck clovers nt the 4-H message to the rest of e boys and girls of rural America.

electing the Dairy Calf for Club Work

HOARD'S DAIRYMAN JUNIORS:—Dur-g my five years of calf club ork I have found that the selection the dairy calf is a very important rt of the work. In most cases this lf is to be the foundation cow of a w herd. The success or failure of a rd depends greatly upon the selec-on of the foundation stock.

Usually we find when a new breed-g establishment springs up, the best the breed in the female line is se-red. The wonderful cows are then aded by one of the breed's best res. In making your choice of a ifer calf, you want to think that me day you will have such a breed-g establishment as the one just entioned. It should be your desire produce some of the very best cat-e the breed possesses in type and oduction.

You will ask what qualifications ust such a calf have in order to be e foundation of such a herd? First, e calf must have breed type and be easing to the eye.

Second, the dam should have good pe; she should have a good yearly cord in her class; and she should be great reproducer of *type* and *oduction.*

Third, the sire must have type true the breed, and must be able to sire aughters that have correct breed pe and make large yearly records.

The calf you select should have lenty of style, a straight top line, a ood deep body with plenty of spring f rib; a deep heart girth that has a ide floor and is well filled in the op; a well attached udder in rear and well forward with teats evenly placed; the rump straight, pin bones well apart and about level with the hip bones; a head that is characteristic of the breed.

Her dam should be true to breed type. Don't buy the "cat in the sack" as we say, when the dam has no record of production. You know that the selection of this calf means a great deal to you, so before you go any farther find out from the owner the records of the full sisters to the cow now in question. In this manner you can avoid the "pop" record. By a "pop" record we mean that one cow out of a group of closely related animals has made a large record, and the rest all run on a good deal lower level.

Always beware of the "pop" record for they are very misleading. The dam must be able to transmit her type and production to her offspring. A cow having a "pop" record usually has no more ability to transmit production to her offspring than her full sisters which produce a good deal less.

If the dam in question is old enough to have some daughters in the Advanced Register, see if they are doing well in their classes. This is a good indication that your calf can do the same when she freshens. The type of the full brothers or sisters of your calf should be kept by them until they are well up in years; for many calves have very nice type when they are young, but may change as they grow older.

The sire of your calf should be even more true to breed type than the dam. A show ring winner is desirable. We again must look for his ability to transmit type and production to his daughters and sons. It is best to buy a daughter of a proven bull. Look and see how many of his daughters are in the Advanced Register. If only a few have been tested find out the reason why the rest were not. Are the records of the daughters well above the average of the breed? Do his daughters' records show quite a uniformity in production? How are his daughters doing in the show ring; are they successful?

In closing this article I will warn you to beware of the "pop" records; watch out for the cow that does not transmit production and type to her offspring; and beware of the sire that fails to transmit production to his daughters. In this article I have brought out the necessity of beauty plus function in the foundation cow of your herd. When going out to buy always remember that little phrase, "beauty plus function," and when you have a calf that possesses "beauty plus function" you are on the right trail to success.

Minnesota. ELMER HAASE.

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue. Let's talk it over.]

You will find more about farm buildings—the silo, hog house, poultry house, corn crib and granary—in our May 25th issue.

Does the silo pay? Practically every successful and prosperous dairyman has one or more silos. There were over a half million silos that proved their worth this winter in reducing feed bills and increasing milk yields. (See page 552.)

Why should silo walls be air and water tight? Because if they are not, spoiled silage will result.

Why should a silo be cylindrical in shape? To prevent excessive spoilage.

Is feeding silage during the summer months a good practice? Yes, it is one of the best methods of preventing the abnormal decline in the yield of milk. It is usually cheaper feed than soiling crops and has been found to be of equal feeding value.

What are some of the common types of silos? The solid concrete wall, concrete stave, concrete block, vitrified tile, wooden stave, wooden hoop, brick, stone, and sheet steel. Pit silos are commonly used in the semi-arid regions.

What determines the size of the corn crib and granary? The capacity wanted. This may be determined by the rule that a bushel of ear corn occupies 2½ cubic feet and a bushel of grain, 1¼ cubic feet. (See page 553.)

What are the weights of some common grains? The weight per cubic foot of grain is as follows: Barley, 39 lbs.; corn and cob, 28 lbs.; shelled corn, 45 lbs.; flax, 45 lbs.; oats, 26 lbs.; rye, 45 lbs.; wheat, 48 lbs.

What are the essential features of a hog house? Warmth, dryness, abundance of direct sunlight, ventilation, sanitation, convenience, serviceability, durability, minimum cost of maintenance, and reasonably low first cost. (See page 554.)

Why are good ventilation and dryness important in the poultry house? Because they are essential to the good health of the poultry and health is a prime factor in egg production. (See page 555.)

Self-help has accomplished about all the great things of the world.

"PELOUZE"
New Dairy Scales
Three Sizes: 40, 60 and 120 lbs. by Tenths of a Pound
Guaranteed Accurate

Made to comply with Departments of Weights and Measures. Large 7-inch Dial, with distinct, black figures and graduations. Patented adjustable hand for obtaining the tare weight of empty pail. Order through any leading supply house, specify "Pelouze." If they haven't it order direct.

PELOUZE MANUFACTURING CO.
232-242 East Ohio Street, Chicago.

Cow Blankets

Cover your stock with "Burch's Best," the blanket endorsed by leading herd owners everywhere. Combine beauty, practicability and low price. Special patented design—fit perfectly.

"Burch's Best" *ARE* Best

Finest material—best made. Fully guaranteed not to rip or tear for two years. Write today for samples, prices and FREE descriptive booklet.

DAIRY MARKET NEWS

Connecticut May Milk

The Connecticut Milk Producers' Association announces the following prices for Grade B milk delivered during May at market milk centers:

All milk sold in fluid form, 9.5 cents per quart for 4 per cent milk, and 4 cents per point allowed for other tests; all milk made into cream that is sold in fluid form, 22.5 cents per pound fat above the average monthly price of 92-score butter on the Boston market; all milk made into butter, at a price per pound fat equal to the month's average on 92-score butter in Boston.

Butter and Cheese in May

Butter averaged 43.5 cents on the New York Market for the first 26 days of May, a decline of nearly five cents from the April average. The May average is still above that of the past few years, being three cents above 1927 and one cent above 1925. As will be noted by the chart, prices for the past week have remained fairly steady despite increased receipts and reports of production greater than last year. The quality of the butter is good and more fancy butter has gone into storage than is usual at this time of year.

Cheese prices advanced a half cent during the month, averaging 22.3 cents. This is three cents above last year and a half cent above May, 1925.

Wisconsin Milk

The Wisconsin average farm price for milk in April was higher than for any April since 1920. An average of $2.05 per hundred pounds of milk was received by the farmers of the state for the month as compared with $1.84 a year ago, according to the Wisconsin Crop and Live Stock Reporting Service at Madison.

During the past six months farm milk prices for the state have been well above the two preceding winters. On an average, the price for the last half year was 14c per hundred pounds above a year ago and over 30c above the price of two years ago.

Since about half of the Wisconsin farm income has for some years been received from milk, this improvement in the price becomes especially significant. The cows of the state produce about ten billion pounds of milk annually and the improved price is, therefore, a distinct help to the farm income.

May Milk Prices

(From Report by U. S. Dept. of Agriculture)

Table I represents a comparison of the net prices received by producers in 103 local markets, for fluid milk (test 3.5 per cent) f. o. b. local shipping point or distributors' country plant:

Twin City April Milk

The Twin City Milk Producers' Association Minnesota paid $2.50 a hundred for 3.5 r cent milk delivered in St. Paul during pril. The Association handled 26,513,581 s. milk, of which 5.0 per cent was surplus. Cream patrons were paid 57 cents a pound r butterfat in first grade cream during pril. This is 6.7 cents above the average ice of 92-score butter on the New York arket.

Feed Market Situation

(By The Grain, Hay, and Feed Market News rvice, U. S. Department of Agriculture.)

Offerings of most feeds were hardly equal to rrent requirements during the week ending ay 18 and prices averaged higher although an and linseed meal were easier at some ints. Further advances in feed grain prices dened the demand for feedstuffs while pasrage made slow progress over the eastern lf of the country, particularly in the Northst where warm, dry weather is needed. The mand for feeds was largely for small lots, ggesting that dealers were piecing out their pplies until the arrival of pasturage.

Wheat feeds ruled firm with shorts and midngs showing a further gain. Production sed on weekly flour output continued about e same as in recent weeks but larger than a ar ago. Demand for bran slackened at a mber of points but an increased inquiry deloped for shorts and middlings, doubtless for g feeding.

Linseed meal was barely steady. Domestic mand was taking the limited offerings at ffalo although there was practically no inry at this point for deferred shipment. ading at Chicago was limited and prices dened slightly at Minneapolis where mills were tching up on their orders.

Cottonseed meal quotations showed a furer advance although most reports indicated at the volume of trading was small. Stocks around 182,000 tons of cake and meal on nd May 1 were larger than at this time ice the war with the exception of the 307,-0 tons held a year ago, but definite inforation is not available concerning the extent flood damage since May 1.

Gluten feed quotations were withdrawn at icago where the local manufacturer was out the market for the next two months and e only offerings available at Buffalo were om re-sellers who were asking sharply higher prices. Demand was good at the latter point while offerings were very small but inquiry for this feed was dull at Philadelphia.

Hominy feed was also sharply higher on limited offerings and continued strength in the corn market. Offerings were steady at Philadelphia. Mills at Buffalo were out of the market for the next thirty days and the limited offerings were moving at much higher quotations than a week ago. Prices also advanced at Cincinnati and at Chicago although quotations were nominal at the latter market. Prices, however, were only about steady at Omaha with demand for immediate needs only.

Alfalfa meal of good quality was wanted at Chicago where even some new crop meal was secured.

Tankage moved freely at the recent reduction to $65 a ton and no accumulations were reported although demand at some markets appeared only fair.

Quoted, May 18: Standard spring wheat bran, Minneapolis, $28.00; Buffalo, $32.50; Philadelphia, $34; Chicago, $31. Soft winter wheat bran, St. Louis, $29.50; Cincinnati, $30; Atlanta, $38.50. Hard winter wheat bran, Kansas City, $28; Omaha, $27.50. Spring middlings, Minneapolis, $29. Gray shorts, Kansas City, $31.75. Cottonseed meal, 43 per cent, Chicago, $39.75; Kansas City, $38.80; Ft. Worth, $32.50. Linseed meal, Buffalo, $47.; Minneapolis, $47. Gluten feed, Buffalo, $38.80. Hominy feed, Buffalo, $35.50; Cincinnati, $35; Omaha, $32. Alfalfa meal, Kansas City, $22.

April Dry Milk

(From Report by U. S. Department of Agr.)

The wholesale prices given below are based on reports from manufacturers governing actual sales F. O. B. factory during April:

Dry Skimmilk: Prices ranged from 7 cents to 11.5 cents for dry skimmilk in bulk, averaging 9.24 cents a pound for sales, totaling 7,895,812 lbs. When packed in one-pound cans the price reported was 31.7 cents a pound.

Dry Whole Milk: Prices ranged from 23 cents to 28.5 cents for dry whole milk, averaging 27.5 cents for sales totaling 520,283 lbs. When packed in one-pound cans the price reported was 45.8 cents a pound.

Dry Buttermilk: Prices ranged from 6.5 cents to 9.5 cents for dry buttermilk in bulk, averaging 8.8 cents a pound for sales totaling 2,422,918 lbs. When packed in one-pound cans the price reported was 10.6 cents a pound.

Butterfat Prices

The five co-operative creameries of Illinois paid a premium of 7.8 cents net per pound butterfat over what their members would have received from cream station operators in the fiscal year just closed.

The price received by dairymen selling to co-operative creameries located in Northwestern and Southwestern Illinois averaged 45.3 cents compared with 37.5 cents paid by private buyers, and 41.7 cents per pound quoted on 90 score butter at Chicago.

On the other hand, co-operative cream buying stations paid an average of 40.9 cents last year, or more than three cents higher than private stations. Co-operative stations in Ohio paid 42.8 cents or approximately two cents more than similar stations in Illinois.

This showing by the co-operative creameries exceeds that of 1925 by nearly 50 per cent. It means that the five co-operatives located at Mt. Carroll, Galena, Elizabeth, Freeport, and Raymond, Illinois, paid their members $49,980 more in premiums last year than they paid the year before.

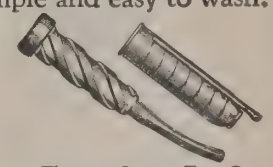
Based on an annual output by the five co-operatives of 2,500,000 pounds of butter, their patrons received $195,000 more than they would have received by marketing their butterfat in the old way at the local cream station.

The survey shows that with the exception of Indiana other Midwest dairy states paid a higher price for butterfat delivered co-operative creameries than did Illinois. In Minnesota the average price was 48.6 cents, in Iowa 49.4 cents, Wisconsin 47.9 cents, Indiana 45 cents, and Illinois 45.3 cents. The highest prices paid by Illinois co-ops in 1926 were realized in December when the average price went to 54.9 cents. The lowest month was July when prices averaged 40.9 cents.

Illinois. A. D. LYNCH.

Perfection Saves Time When Time Is Money

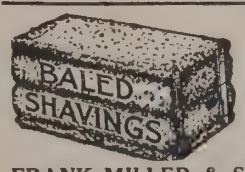
HAVEN'T you often wished to be in the field an hour sooner or stay an hour longer? Yet at busy times, as always, two or three persons must drop their other work for milking.



This is no longer necessary. With a Perfection Milker, you can have that extra hour every morning and night. One man with the Perfection does the work of three by hand, and does it better. Let the others go on to the field.

When plowing, seeding or harvest is pressing, when extra time is extra dollars, then Perfection saves money for you. Many users say it is indispensable.

As the Perfection saves you time it will make you money. Cows like it better than hand milking and they yield more milk to its natural uniform action. The new sanitary teat cup milks cleaner, faster, with less vacuum; only two parts—simple and easy to wash.



The Perfection Milker puts two extra days into every week for thousands of satisfied users. It pays for itself each year in the saving of wages alone.

Why milk by hand? Write today for your copy of free catalog. Learn how to save valuable time.

The new 2 piece Teat Cup. One pull and it is all apart for quick and easy cleaning.

PERFECTION MILKER

Now is the Time **All wise Dairymen get their orders placed for Baled Shavings.** They are plentiful now and can be bought at a reasonable price. Don't wait until they are scarce and high and be left without them. Write us today and reserve a shipping date and it will save you money.

FRANK MILLER & SONS (*The Sawdust Millers*) 3613 Auburn Ave., Chicago, Ill

for feeding calves

Do you know that you can cut milk costs in half by adopting the "minimum milk method," using dry skim milk? Hundreds of dairymen who sell all their whole milk are making this big saving. They simply mix a pound of dry skim milk with a gallon of water, making a money-saving mixture which young calves thrive on. And they buy a pound of dry skim milk for half or less of what they receive for a gallon of whole milk. (1 gallon whole milk contains 1 pound milk solids.)

AMERICAN DRY MILK INSTITUTE
160 North La Salle Street Room 720-C
CHICAGO, ILLINOIS

FREE Write today for "Better Calves" giving successful feeding methods. State number of calves you feed. We'll tell you where to buy dry skim milk.

Remixed—1 pound dry skim milk to 1 gallon of water—is also good for pigs and poultry. It is splendid also for baking.

Replacement Head for FORDSON means

MORE POWER

Gives 3 to 5 horse power more. Saves its cost in thirty days' operation, then it's clear profit.

INSTALLATION EASY

Only a wrench and an hour's time needed. Nothing to fit, file or adjust. Sold on a money-back guarantee—low in price. Sold by dealers, garage men or direct. Write for "Ricardo Replacement Head" book describing and giving prices on Fordson, Ford and Dodge Ricardo Replacement Heads.

Beating the Labor Problem in Silo Filling

(Continued from page 603)

run on top of the silage all night.

I have heard warnings about getting too much water on silage, but I do not believe it possible to do so. If more water is put on than can be taken up by the silage, it runs out below. Some of the best silage I ever made was in the pit of one silo, where it was necessary to wear boots and bail out water before throwing the silage out.

If there was any advantage in tramping or weight, water added to the silage would supply this advantage. A ton of water added would result in considerably more pressure than would be obtained by a 200-pound man tramping.

From September 18, when we started, until October 9, when we had the last of the four silos full, we had nothing but rain. During that time we were able to work twelve days and sometimes then it was raining. Although the corn had been killed by the frost it did not dry out as badly as would have been the case in a dry season. There were days, however, when dust flew from the cutter, and the power required to cut the tough, dry corn was increased.

The second, third, and fourth silos were filled in the same manner as the first as regards tramping. By the time the third and fourth silos could be filled the corn was in very bad condition. To look at and examine it, the experienced corn fodder man would say that it would make a very poor quality of corn fodder. Yet this corn has made good silage, perhaps a little off on quality, but still there were not any spoiled spots.

The Low Rack Wagon

It had always been the custom to use the ordinary hay wagon to haul the corn from the field. These wagons are so high that the corn must be lifted up to the driver who stands on the wagons and when unloaded the driver must stoop and lift from the level of his feet.

It was also the accepted practice to have "loaders" in the field to lift the corn up to the drivers on these high racks. One loader to each wagon or from four to five loaders to five or six wagons. With the old system of filling this is about the crew required

3 men tramping in silo
1 man holding distributor pipe
1 man feeding cutter
1 man helping driver unload
1 man operating tractor
5 drivers with teams
5 loaders

17 men, total

It looked reasonable to do away with the loaders and lighten the work of the drivers by the use of the low-down wagons. In 1926 four of these racks were made according to the plans shown.

This wagon has proved to be a wonderful labor saver. The driver loads his own load and he unloads while standing on the ground at the side of the wagon.

Three of these wagons were used to haul from near fields and four from distant fields. After checking up on the number of men required for filling in 1926, the results were gratifying:

1 man feeding cutter
4 drivers with teams
2 loaders

7 men, total

The reader will notice two loaders listed above. These men did not spend all of their time loading but helped to cut also. The tornado that flattened our corn in August put the corn binder out of our list of labor saving machines for that year. It has been my experience that the corn must be cut by hand two years out of five, because of wind and rain.

It is true that the big outfit of seventeen men used in 1925 was a fast filling outfit, but it was not fast enough as compared to our seven-man outfit used in 1926. The big outfit filled about one-third faster than the small outfit, but that gain in time would not justify the use of seventeen men as against seven men.

The gentle art of filling silos is veiled with many superstitions and theories, none of which are founded upon fact or experimentation. Probably more so than any other "dark of the moon" farm operation. Go on any silo-filling job and you can prove it. "Not enough water." "Too much water." "Corn is too green." "Corn is too ripe." "Not enough men tramping." "Hose should be in the far." "Hose should be at the top." Everyone has a different idea as to what is right.

My experience of the last two years has settled several much-disputed questions, so far as I am concerned, and in the future our silo-filling job is going to be done with fewer men and no worry according to these rules:

1. No tramping done.
2. No distributor pipe to be used.
3. Corn must be 80% mature.
4. Cut in one-fourth-inch lengths.
5. Don't worry about frost if there is plenty of water.
6. Add water and then more water if corn is dry.
7. Use low-down wagon racks.

HAVE A CAMEL

No half-way verdict—Camel is supreme

THE American people have had many favorites. But there's never been a choice like Camel.

Camel is the most popular cigarette this nation ever had. Millions unite to place it first, and there's no comparison. Camel is supreme.

There must be reasons back of such a preference. There must be mountain-high quality in this famous cigarette to make millions join in saying, "I will have only Camel."

That is true. Camel quality is just as supreme as its leadership. In Camel, no substitute has ever been made for quality. No compromise has ever been made with expense. For Camels, the country's largest tobacco organization buys the choicest Turkish and Domestic tobaccos grown. There simply are no better tobaccos or blending.

If you don't yet know that supreme tobacco enjoyment, try Camels. All the taste and fragrance, all the mild and mellow pleasure you ever hoped to find! We invite you to compare them with any cigarette made, regardless of price. *"Have a Camel!"*

Beautifying the Country Roadside

(Continued from page 602)

igher form of income called happi-ess, for no man can plan, plant, and are for a project of this kind with-ut adding to his joy in living.

Shrubs Preserve Cuts

Highway patrolmen and interested ommunity boosters can plant hardy ative vines and shrubs as well as rasses on the raw banks in cuts and lls. The cost of such planting ould be small in comparison to the ctual saving from the prevention of rosion. What a vast difference there between a shrub overgrown cut nd the ugly scars that are so often ft along our roadsides by construc-ion engineers. In setting out trees, owever, beautiful views into valleys

C. MARNEY'S MAIL BOX, OREGON, IS BUILT LIKE A HOUSE AND STANDS IN THE SHADE OF A BEAUTIFUL TREE

r across ridges should be left clear. or safety purposes no new tree plant-igs should be set within 150 feet of a ighway crossing and 400 feet from a ailroad crossing, because the risk of fe is too great a cost to pay for the dded beauty. The inside of curves, oo, should be kept open so a driver an see what is coming. All plant-igs, whether trees or shrubs, should ake into account their effect on the oad for transportation purposes and e set so they do not cause snow rifting on the road bed nor shade irt roads so much that they will not ry out quickly.

The type of planting will depend omewhat on the landscape and near-ess to a city. Straight lines of trees n both sides of the road stretching or miles and miles would soon grow onotonous, but alternate stretches f such a style of planting with lumps of trees on knolls and high laces will relieve this objection, es-ecially if many of the native variety re set. In any event the planting ould be such that it will fit in har-oniously with the native landscape. he landscape architect, Jens Jen-sen, says we do not want our prairie highways checkerboarded with lines of trees, as scattered plantings are more in keeping with the American mind.

Kind of Trees to Plant

Much could be said about the kind of trees to plant. In Europe one can find thousands of miles of roads planted to fruit and nut trees. It is an inspiring thing to travel over these roads at blossoming time. In those countries a considerable revenue is realized from them. Judge Simpson of Lafayette County, Wisconsin, has suggested that one fruit tree should be planted at every mile post as a start in this direction. In planting fruit trees along the roadsides, however, it will be well to remember that such trees will not bear good quality fruit unless they are sprayed and pruned. The sense of private property is probably not yet well enough developed in this country to guarantee that the fruit will be free from thievery, but we may develop that sense some day. Counties cannot hope to plant such trees for revenue purposes unless states pass laws giving the highway commissions complete control over the highway, or unless the farm owners dedicate such uses to the public.

Since nut trees cost but little more to start than ordinary shade trees, farmers can well set some of these along their roadsides. It is not an uncommon thing to hear of such trees producing as much as $50.00 worth of black walnuts in a single year. Moreover, cows enjoy their shade quite as much as that from an elm and the harvest is more pleasing to the boys, pigs, and squirrels than are shade tree leaves.

No one has figured out how much a shade tree in a pasture is worth to a cow in dollars and cents, but no cow is contented when she has to fight flies on a hot summer day without any protection from the sun. Contented cows are usually profitable ones, so the dairyman who provides contentment for his animals in the form of shade along the roadside not only adds to the beauty and charm of the landscape, but he increases his milk check at the same time.

Much could be written about planting forest trees along the roadside as a means of increasing the farmers' fuel and lumber supply. Farmers who do plant such trees, however, should set them far enough to the side of the road to provide for future improvements and they should set them far enough apart so they will not cause drifting of snow or undue shading of the roadway.

Perhaps it will not be amiss to close this article with a few words about Thomas Jefferson and his flowers. It is said that he never went on a journey but that he took a bag of flower seeds with him to scatter along the highways. Much of the loveliness of the Virginia landscape is credited to him, because his flowers are still bearing annual crops of beauty.

Ohio Holstein Sale

At the Ohio State Guarantee Hol-ein Sale held May 3—4 at Wooster, 3 animals were sold for $26,490, an verage of $275, with $2,475 the top gure. This one four-figure price was aid for Sir Hollyhock Cornflower, a -year-old son of Creator out of Pabst orndyke Cornflower, 38-lb. 3-year-d that established a price record at e 1920 National Holstein Sale. This re was consigned by John E. Smith and purchased by the Lousangle Co. Home, California.

Haeger, Andrews, and Barker did the selling. The sale was under the management of the state association.

Below are given the averages for animals of the different classes: Thirteen bulls averaged $470; 11 heifers under 2 years, $170; 6 two-year-olds, $233; 8 three-year-olds $263; 57 cows, $261.

Activity is the only road to knowl edge.—G. B. SHAW.

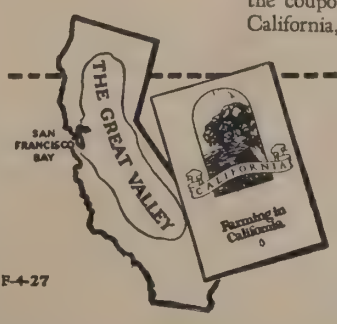
Better profits from a smaller farm *in California*

HALF the farms in California are less than 50 acres. A third of them are under 20 acres.

Yet 136,000 farms like these—about half the number you will find in many eastern states—produce an annual crop-wealth of more than $700,000,000 and have made California the third greatest agricultural state in the Union. And four of the eight leading counties in the United States are in California's Great Valley.

Come out and see what you can do to share in California's prosperity, with less work, fewer hardships, more kinds of enjoyment for your family than you have now. Talk with farmers in the Great Valley and the other valleys that border it, who have owned farms both here and in the East—ask them whether they would be satisfied to trade with you!

Ask them what a California winter is like. Let them show you oranges that will be sweet and ripe on the trees this winter when the snow is drifting over the fences at home. Watch them "making" their own weather, under a cloudless summer sky, with the help of California's abundant irrigation. See the fine stands of alfalfa that yield five or six crops for cutting and leave another one green and growing for winter pasturage.



These are farmers who can show you cream checks that are 20% higher than the price the average farmer in the East gets for his butterfat. Out in their fields are pigs from last year's second litter—worth up to $2.00 a hundredweight more than yours because with all our advantages we still raise only 25% of the pork we need.

Then talk with the manager of any big creamery plant. He will tell you about California's 22,000,000-pound shortage of butter every year in California, although dairying is easier, cows live longer, and the average production of butterfat per cow is the highest in the United States.

The fact grows plainer the more you investigate—California needs more farmers to produce butter, hogs, eggs and poultry for the people in our growing cities. If you have succeeded where you are, you will succeed here where conditions are so favorable—and like it better. You will like our schools, our highways, the nearby mountains and seashore and the great cities on San Francisco Bay.

Low summer round-trip fares to California—$90.30 from Chicago for example.

Californians Inc., a non-profit organization of citizens and business institutions interested in the sound development of the state, has published an 84-page booklet of clear authoritative information on what you will need, where to go, what to look out for and how to find just the place you want to live. It is free, and will be sent you postpaid for the coupon below. If you are seriously thinking about moving to California, or interested, send the coupon today!

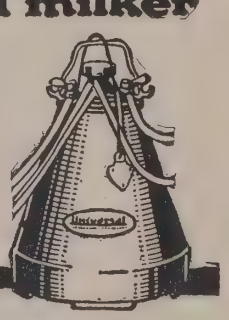
Preferred by America's Leading Dairymen —

SUCH famous dairy herds as these are milked by Universal Natural Milkers:

The herd which produced the Grand Champion Holstein Cow at the National Dairy Show, Detroit, 1926—

The largest pure-bred Guernsey herd in the world—

The foremost pure-bred Guernsey show herd of 1926—

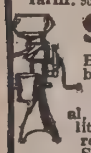


And hundreds of other nationally known pure-bred herds of all breeds—producers of Certified, Inspected, and Grade "A" Milk. The owners of these herds (America's leading dairymen) know the value and importance of low vacuum, alternating action (like milking with hands), the perfect teat cup, a life-time guarantee, and service after the sale. You get all of these features, and more, when you install a Universal Natural Milker.

THE UNIVERSAL MILKING MACHINE CO.
Dept. H, Waukesha, Wisconsin

Universal natural milker

Our new 24-page catalog has the whole story and will be mailed free on request.



Two Types: Double and Single Units.

Better Milk by simply using the B-K Rinse

85% of bacteria in milk comes from contact with non-sterile cans and other utensils at the farm. 95% of them can be removed by a B-K rinse.

Separators

B-K rapidly dissolves the invisible film of casein and other matter that clings to the bowl and fittings. After washing as usual, you rinse in water containing a little B-K, effecting remarkable reduction in bacteria and germs. Send for Separator Bulletin 112.

Milking Machine Parts

Just keep them between milkings in a dilution of B-K and water. For protection against possible spread of infection, from cow to cow while milking, rinse the cups and tubes in a pail of the B-K dilution after milking each cow. Send for Milking Machine Bulletin 124.

95% Bacteria removed by B-K Rinse

Cans

Without B-K Rinse

with B-K Rinse

Illustrations are based on actual tests. Milk Can No. 1 after washing with hot water and brush, contained 41,000,000 bacteria (not fit to receive milk). Can No. 2 after washing the same way was given a B-K rinse. 99% of all bacteria in the can was destroyed. Send for our Bulletin 928 on sterilizing milk cans.

Farrington's New Book

"Quality in Dairy Products" is the title of a new book of 250 pages by Professor E. H. Farrington of the Wisconsin College of Agriculture. In his preface Professor Farrington states that there appears to be considerable similarity among the many questions that have been answered by him during the years he has been connected with the Dairy School. This suggested that a reference book based on these common, every day questions would find a place among those engaged in the production of milk and those engaged in the manufacture of this milk into its various products.

The buttermaking group covers the causes and prevention of common defects in butter; instructions for cream grading, pasteurizing, and neutralizing; starter making, butter working, testing, and figuring overrun as well as many other problems that come up in the every day work of buttermaking.

The cheesemaking group includes a discussion of the causes and prevention of some of the defects in cheese; the paying of patrons for milk by several methods and many helpful hints to patrons about the quality of their cows and their milk.

The ice cream making group of inquiries refers to overrun, sandiness, weak body, unevenness in flavor, texture, etc., together with suggestions about causes of good and of bad qualities in ice cream.

The dairy farmer and the cow milker group of questions discusses the causes of variation in milk and cream tests; the effect of individuality and ways of milking as well as many other practices on the milk production of a cow; points on running a farm cream separator; ways of taking accurate samples of milk for testing; why dairying is profitable; the creamery vs. the cheese factory from the dairy farmer's standpoint; and other practical questions that come up in the every day work of a cow owner and a cow milker.

Copies of this book will be sent postpaid by the Book Department of Hoard's Dairyman upon payment of its regular price of three dollars.

Poisoned Sudan Grass

HOARD'S DAIRYMAN:—An experience which is not welcomed by any farmer has been the lot of T. M. Lambert & Son of Antelope County, Nebraska, when 34 of their 100 head of stock were killed by supposed poison from sudan grass hay. The story of the poisoning as told by Mr. Lambert is as follows:

"We had 100 head of cows which had been running in the cornstalks and at the same time had access to wild prairie hay. To give them a change of feed we hauled to them during the forenoon a load of sudan hay from the top of stack. About noon of the same day my son came from the yard and reported one of the cows dead and another one of them down. I went to the yard immediately, which was half a mile from our home, and on arrival I found eight or ten of the cows down and within three more hours there were 34 of them dead in spite of anything we could do to save them."

The sudan grass was cut for hay just as it began to show heading and after cut it was allowed to lie on the ground about ten days. This was partly due to a rain which hindered stacking it before this time. But, outside of some coloring, the hay appeared all right.

This crop did not grow fast at first as sudan usually does, but this was probably due to very dry weather at that time. Foxtail grass and pig weeds came up very thick in the field. But later the sudan started to grow and as it was on comparatively rich ground it grew exceedingly fast. Mr. Lambert says he never saw any plant life with a more vigorous growth from this time until cut. It is thought that this regrowth from a stunted condition might have formed poison which later killed the stock.

Instances of poisoning have been known from this forage elsewhere, but it has generally been supposed that it was caused by allowing the grass to stand until after frost before cutting.

Nebraska. GEO. G. MCVICKER.

This report was so unusual that we referred it to the Nebraska College of Agriculture. Dr. L. Van Es replies as follows:

"This particular instance has not been called to our attention by any one in the state, but I believe the following comments are entirely warranted by the circumstances described:

"The accident described has all the ear marks of prussic acid poisoning. This is occasionally seen in many forms of forage, including the sorghums, and especially so when at the end of the season either by frosting or other factors the vegetative processes were either interrupted or altered.

"Prussic acid forms as a result of the action of an enzyme on some of the glucosides. It cannot always be foretold when this poison is apt to form or when it is apt to cause damage. But this is certain, when sudan grass or any of the sorghums are to be fed as hay or otherwise after the growth has been damaged by frost or arrested in some other way, then great care and caution should be exercised in feeding it. In such a case it is always well, in the first place, to leave the fodder until toward the last of the dry feeding season and before it is given to a large number of valuable animals to have its character tried out by feeding it to one or two animals of inferior value for a couple of weeks.

"With caution in curing and with the precaution mentioned, the occasional poisoning of animals by this type of fodder should not detract from its great feed value."

On Guernsey Pilgrimage

The following is the membership list of the American Guernsey Cattle Club Pilgrimage that sailed from New York per S. S. "Tuscania," May 14, to the home of the Guernsey breed. This pilgrimage is in honor of the fiftieth anniversary of the Club's organization:

Miss Arvilla Boese, Miss Jessie M. Hill, Mr. and Mrs. J. C. Ralston, and Mr. and Mrs. Ralph Tratt, Wisconsin; Floyd S. Barlow and Mrs. Champ Jackson, Ohio; W. de L. Burgess, J. D. Dodge, Robert Scoville, and J. Law Siple, New York; John Endicott and Miss Elizabeth T. Endicott, Michigan; Mr. and Mrs. G. P. Clark, Rhode Island; C. B. Finley, Minnesota; W. W. Fitzpatrick, South Carolina; Mr. and Mrs. Wm. F. Fretz, C. A. Hayden, M. J. Judge, Chas. E. Patton, and Frank W. Smedley; Mr. and Mrs. E. T. Gill, John Gill, VII, Miss A. L. Gill, Wm. M. Nulton, and G. E. Ward, New Jersey; D. W. Gates, Connecticut; Mrs. Tena Har and John Hastie, Washington; R. I. Holden, Indiana; Mr. and Mrs. H. C. Horneman and K. Horneman, Illinois; Mr. and Mrs. E. J. Montague, Massachusetts; Mr. and Mrs. Karl F. Musser, New Hampshire; Mr. and Mrs. T. R. Phillips, Vermont; E. I. Westover, Oregon.

Irate Employer: "Late again; have you ever done anything on time?"

Clerk: "I bought a car."

-feeding Pigs on Pasture

f-feeding pigs has become a ar practice among progressive rs of late years because, when rly done, it reduced the labor rements, increased the rate of and consequently fitted pigs for rly fall market which, as a rule, mewhat higher than the prices for similar hogs later.

this time of year when pas- are generally good and when are ready to be pushed toward et weight, a discussion of self- ng pigs on forage is in order. aver at the Missouri Station fed groups of 40-lb. pigs on rape re plus ground corn, shorts, and ge. One lot was self-fed, each e three feeds being placed in ate compartments of the self- r so that the pigs could take as or as little as they wanted. The lot received the three feeds l in the proportion of 9 parts 3 part shorts, and 1 part tank- The mixture was wet with wa- nd fed twice daily as a thick as much as the pigs would clean

e average daily gain of the self- igs was 1.05 lbs. per head com- l with 0.95 lb. for those hand- The amount of feed required ach pound of gain was 3.84 lbs. elf-fed pigs and 3.65 lbs. for -fed pigs.

bison of the Ohio Station sum- es the results of self-feeding ifferent groups of pigs that re- d forage of some kind and of fferent groups hand-fed on for- In all, 67 pigs were included e self-fed groups and 165 pigs e hand-fed groups. Corn and ge constituted the basal and emental feeds used. The pigs ged 55 lbs. weight at the be- ng of the trials.

e average daily gain of the self- igs was 1.49 lbs. per head and he hand-fed pigs it was 1.28 lbs. consumed for 100 lbs. gain was bs. for the self-fed pigs and 338 or those hand-fed.

nry & Morrison of the Wiscon- Station summarize the results trials comparing self-fed pigs those hand-fed on pasture. Corn tankage constituted the basal supplementary feeds. The self- igs made an average daily gain .32 lbs. per head and required lbs. of feed for 100 lbs. gain; and-fed pigs gained 1.2 lbs. per daily and required 364 lbs. of for 100 lbs. gain. The pigs ged 58 lbs. at the beginning of rials and were fed for an aver- of 112 days.

l of the foregoing experiments that hand-fed pigs on forage ire less concentrates per 100 lbs. than do self-fed pigs. Robison ins this by saying that since pigs h have access to concentrate at all times are inclined to eat rather than exert themselves much in procuring green fed, self-fed pigs utilize less forage than do hand-fed pigs even though the latter are fed all the concentrates they will clean up readily twice daily.

Dairy farmers who have skimmilk available should bear in mind that when pigs are on pasture the requirement for protein is somewhat lessened and the amount of skimmilk fed may be cut down quite materially and still get good results.

It is erroneously assumed that pigs will properly balance their rations if a variety of feeds are set before them in separate self-feeding compartments. This holds true only with corn and tankage. For example, if ground barley and tankage are offered pigs they will eat more of the tankage than is necessary to properly balance the ration. If linseed meal is offered pigs in a separate compartment, they will usually refuse to eat much of it but if it is mixed with tankage or tankage and shorts they will consume a considerable quantity and what is more will do well on the supplemental mixture plus corn or other carbonaceous feed.

The self-feeder is not adapted to feeding brood sows or to pigs that are to be grown for breeding stock rather than fattened because the tendency is to become too fat. The only way to avoid this is to offer a concentrates mixture containing considerably more bulk than one suitable for rapid gains on pigs to be fattened.

In using the self-feeder the feeds offered, that is the basal and supplementary feeds, must all be about equally palatable else the tendency is for pigs to eat too much of one feed and not enough of another. If one finds a tendency to this it may be corrected by mixing the feeds in proper proportion.

Good Pastures Reduce Grain Requirement of Pigs

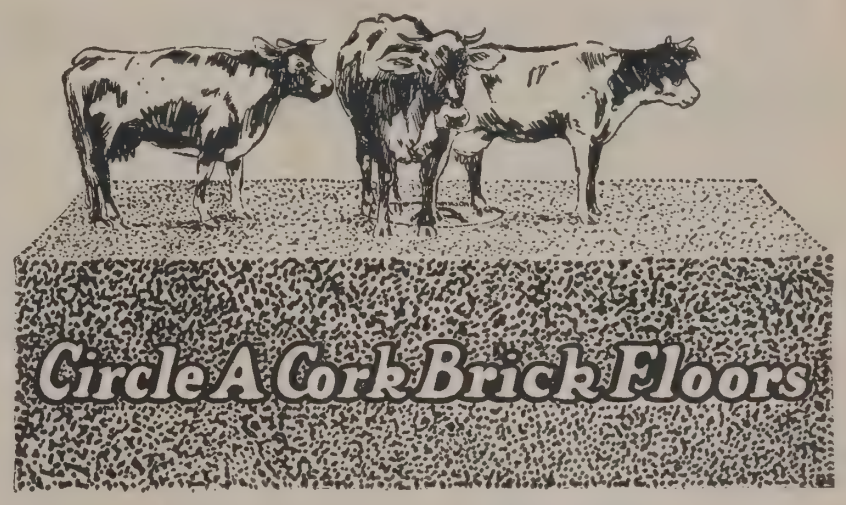
On the average dairy farm the number of hogs grown is limited, quite largely, by the amount of grain grown that is not needed for the dairy herd. This is as it should be, provided the cows are good enough to make a profitable return on the grain. As long as the grain available is the limiting factor with hogs, an effort should be made to make it go as far as possible. This may be done by the use of good forage crops.

The Wisconsin Experiment Station supplies us with good evidence on this point. For five years comparisons were made of pigs self-fed corn and tankage in dry lot with similar pigs fed these feeds plus alfalfa and rape pastures.

The pigs that were deprived of pasture gained 1.05 lbs. per head daily and required 441 lbs. corn and 42 lbs. tankage for 100 lbs. gain. The pigs fed on alfalfa pasture gained 1.31 lbs. per head daily and required 374 lbs. corn and 21 lbs. tankage for 100 lbs. gain. Those pastured on rape gained 1.3 lbs. per head daily on a feed requirement of 375 lbs. corn and 23 lbs. tankage for 100 lbs. gain.

The alfalfa pasture pigs required 67 lbs. less corn and 21 lbs. less tankage and the rape pasture pigs 66 lbs. less corn and 19 lbs. less tankage per 100 lbs. gain than the "dry lot" or "no pasture" pigs.

Converting these gains into money value using $9.90 a hundred as the average selling price of hogs and deducting the feed costs on the basis of 85 cents a bushel for corn and $68.90 a ton for tankage, we have the following returns per acre over the grain and supplement feed costs: Alfalfa pasture, $99.66; rape pasture, $97.76. The pigs fed in dry lot without pasture would have returned $47.67 above the cost of their corn and tankage if applied to the same number of pigs as were carried on one acre of rape pasture.



No consideration is given to the more rapid gains of the pigs on pasture. The pigs were started at about 50 lbs. weight and carried to about 225 lbs. On this basis the pasture fed pigs were ready for market about 31 days sooner than the dry lot pigs.

It is not too late to seed some rape for pasture for this year. Looking ahead one can put in some alfalfa for hog pasture for next year. It doesn't take a large acreage. One acre of good rape will carry 20 pigs and good alfalfa pasture will carry a few more. Three acres of either pasture will carry more hogs than are commonly produced on the average dairy farm.

Cork Brick Floors
Make Safe, Comfortable Floors

FLOORS of Circle A Cork Brick are warm, resilient, nonslippery, and dry. They promote the comfort and protect the health of your herd, and prevent dangerous slips and falls. They are not a luxury for the "fancy" barn, but on a dollars-and-cents basis, a necessity for *every* barn, large or small. Circle A Cork Brick pay for themselves many times over in health for your herd and in increased yields.

Write for sample brick and illustrated book, "Circle A Cork Brick." ARMSTRONG CORK & INSULATION COMPANY, (*Division of Armstrong Cork Company*) 112 Twenty-fourth Street, Pittsburgh, Pa.

For Dairy Barns and Hog Houses

FLY-CIDE
KILLS FLIES

Easy — Quick — Safe
No Mess — No Stain

Year after year thousands more dairymen and farmers come back for Fly-Cide. The reason is plain. It is consistently the best fly repellent on the market. It kills flies quickly, safely and harmlessly—without injury. Fly-Cide has proven the best, and is sold strictly on its own merits. Users tell their story. "It does the work better and quicker." "Nothing like Fly-Cide on the market. Rids cows of flies and pests." "Does not burn or gum the hair." Just try Fly-Cide once. It's fully guaranteed.

SOLD UNDER GUARANTEE

We want to acquaint those who are not already using Fly-Cide, so have arranged to prepay the freight on your initial order. Try Fly-Cide at our risk. Order any amount, and test it in every way. If not delighted with results just send the unused portion back, and your money will be refunded. Prices, freight prepaid on the first order are: 1 gallon can $1.75. 5 gallon can $6.00. 10 gallon can $11.50. 20 gallon drum $22.00. 50 gallon drum $50.00. Household Fly-Cide for the home. $1.00 brings trial size prepaid. Write today.

Poultry on the Dairy Farm

A Profitable Unit

The essentials for profit from a poultry flock at any time under any conditions or with any market price is determined by the efficiency of that unit. Efficiency is determined in part at least by the machine, which means the breeding of the flock; the house, which means the cost and comfort; the age, which means the time of hatching as well as the proportion of pullets and hens; the feed, which means the completeness of the ration; and the condition, which means freedom from disease and parasites, both external and internal.

All of these points are a part of the regular management of any good farm flock with an average investment and average care.

The following points have been stressed for farm flock owners in Wisconsin:

1. Chicks purchased on basis of quality, not price.
2. Early hatching.
3. Flock at least 80% pullets and 100% if possible.
4. Started, ranged, and matured on clean ground.
5. Maximum of 400 chicks to a unit; coal burning brooder in early season; efficient, economical ration.
6. Portable brooder house.
7. Wisconsin type gable roof, straw loft house.
8. Pullets prepared for a production in October and November.
9. A complete ration with cod liver oil during winter.
10. Uniform production, low cost per dozen.

The success of this program is best evidenced by the results to date of Oscar Westberg, in Douglas County. He purchased 700 S. C. W. Leghorn chicks from a breeder operating an accredited hatchery. The price on these chicks may have been a little bit higher than through some other sources or sections, but the chicks were all sired by production bred 200 or better egg males. He was building the right sort of a foundation on which to start the year.

These chicks were purchased about April 8 and were started under two coal burning brooder stoves. He was not taking a chance on weakening the entire bunch by brooding with just one stove in one small room with consequent poor results. He wanted them early to obtain late fall and early winter eggs.

Since Mr. Westberg is located in a dairy section, he used the Wisconsin 80—20 mixture with milk to drink. Up to six weeks of age there had been a loss of only six chicks, and 330 pullets were brought through to housing in the fall.

It might be worthy of note to state that the chicks were started in the house for the first six weeks and were then moved to absolutely clean range and raised there until housed in the fall. No absolute records on brooding were kept but they thought that the income from the sale of the cockerels as broilers about paid for the pullets to laying age.

The house was a 20x40 two unit, gable roof, straw loft. Other types would undoubtedly work, but this house is especially designed for Wisconsin conditions. In this building, in extreme Northern Wisconsin, it w possible to bring the flock throu without freezing.

The ration was a regular scrat and mash composed of easily tained ingredients. The scratch co sisted of 2 of corn, 2 of wheat, 1 barley. The mash was the "Big Fiv of equal parts by weight of grou corn, ground oats, wheat bran, whe middlings, meat scrap, and 1% fine salt.

In addition, cod liver oil was us at the rate of 2% or 1 quart to ea 100 lbs. of mash. We do not consi this at all unusual since all of better farm flock poultry keepers Northwest Wisconsin use cod liver continuously from late fall u spring. This is considered just as tegral a part of the ration as ma water, or shell.

In the fall, about 330 pullets w housed. This number was decrea by culling to 275 when the rec work started Nov. 1. Nothing pullets were kept, which was one factor in the profit and low prod tion cost per dozen eggs in the ea winter. Production started in O ber but no record was kept until N 1, when the flock record starts for year.

The following table gives the turn to date:

Month	Nov.	Dec.	Jan.	Feb.	M
No. pullets	275	275	270	265	
No. eggs	4,782	4,922	5,167	5,146	5
Feed cost	$34.81	$42.80	$40.40	$40.80	$3
Profit	$150.89	$131.70	$131.80	$66.95	$5
Av. No. eggs per pullet	17.39	17.89	19.14	19.41	2
Feed cost per doz.	$.09	$.104	$.093	$.094	$

A good flock of hens that had b culled in the fall gave the follow production for the same period in same county: November, 0.77 e per hen; December, 0.38; Janu 1.98; February, 9:76; March, 18.6

The contrast gives one a better ception of the heavier early proc tion obtainable from pullets t from hens. If market conditions tinue as at present, and they will will be found necessary to have h ier production earlier in the win This will mean a higher percent of early hatched pullets in the fl For farm flock owners buying b chicks, it should mean housing pullets each fall or at most a low per cent of good hens.

A second advantage derived f this sort of a unit is noticed in more uniform production each mo The hen flock cited jumped from egg per hen in November when were high to 18.62 eggs in M when the price was low. With a comparable to this and a lot of g solid horse sense, one need fear overproduction or loss in the pou flock.—J. B. HAYES.

Kamala for Worms

The poultry department of y paper recommends the drug, kam as a treatment for worms in p try, but it does not state how to it nor how much. We know our h have worms and I would appreci very much if you would explain t things for me. Could it be used little chicks and, if so, how

ıld they have? Does the ordi-
r drug store handle this drug?
adysmith, Wis. (MRS.) J. M. W.

amala is a reddish brown powder
:h can be purchased from any
rgist, but as it can be adulterated
the best quality should be pur-
ed. As a flock treatment it is
ssary to group the birds accord-
to weight, fast them for about
ıours, then compute the amount
amala required by the following
e: Birds weighing one-half to
pound, ¾ gram; birds weighing
to three pounds, 1 gram; birds
hing three pounds and over, 2
ns. The powder should be mixed
one-third as much corn meal as
flock will consume at one time.
not, however, necessary to fol-
this treatment with a purgative.
ases of heavy tapeworm infesta-
it will be necessary to follow
with a second treatment.
ndoubtedly the best results come
the individual treatment of
s with the kamala in capsule
n. In case of that, the follow-
table is used:
ne birds weighing one-half to one
ıd, one-half gram; birds weigh-
one to two pounds, 1 gram; birds
hing two pounds and over, 1½
ns. Kamala can be put into half
n gelatin capsules and can be
easily administered by dipping
il of some sort and then placing
n on the back of the tongue of
bird. This seems like quite a
undertaking, but it can be done
rapidly and is probably the most
factory thing to be followed.
efore administering any sort of a
tment it is necessary for a per-
to be positive as to what they are
ting for. One should call a vet-
arian or a sample should be sent
neir own college for examination
e sure that it is tapeworm that
esent, in order to treat for tape-
n rather than just having the
ıd worms present and then giv-
the tapeworm treatment. These
require, apparently, two distinct
s of medicines or drugs.
treatment is the best way out of a
proposition, and is not entirely
factory. It is like bandaging up
fingers after having been burned
ead of keeping your fingers out of
fire in the first place.
fter a heavy worm infestation of
sort there is a tendency for the
stinal walls to become thickened
the result, undoubtedly, that di-
ion and assimilation are seriously
fered with. In other words, if
examine the intestinal wall of a
that has been infested with
ns you will find that it undoubt-
isn't getting the full value of
food that would be obtained in
the walls were normal in con-
n.
nat is the reason why, within the
year or so, so much emphasis
been placed upon the necessity
lean range, clean brooding, and
n everything else in connection
brooding and rearing chicks to
ent worm infestation if possible,
er than attempting to correct or
rol it afterward.
ven clean range is not 100 per
proof that tapeworms will not
ound in any of the birds, but it
is taking advantage of every possibility of preventing this, and we do know that better chicks will be produced on clean range than is possible when the old range that the old hens have been using is made available to the chicks year after year.

One reason why even range will not absolutely control tape, is that they feel that the flies can be one of the intermediate hosts for dissemination of these. In this case it will be necessary not only to provide clean range but also to screen the houses and the range or the runs that the chicks have available to them to exclude flies at the same time.—J. B. HAYES.

Pullets Starting to Lay

I have some Barred Rock pullets hatched January 7, two or three of which are beginning to lay. They started at the age of 3 months 15 days and 3 months 18 days. Don't you think they are laying too early? Would it not be better to hold them back until June or should they be fed so as to rapidly continue their growth and let them continue to lay? They weigh 3 to 3½ lbs.

How could I feed them so as to continue their growth and check their egg production? I have been feeding the Wisconsin ration. They have had all the sour milk they will drink and recently a limited amount of water.

Banks, Oregon. (MRS.) R. L.

These Barred Rock pullets have gone beyond the stage where it is possible to do anything with them. Barred Rocks starting to lay in 3½ months is entirely too early, since it is absolutely impossible to develop enough chicken in that length of time to ever carry them through with a size that will result in a continuous sustained production from them.

What I am trying to point out is that when stuff is along about 12 or 14 weeks, weighing 1½ to 2 lbs., it is possible at that time to drop out a certain amount of animal protein feed which is responsible for the sexual development of the birds. With this 80—20 ration one can drop out the liquid milk fed to the birds in part or in whole, depending upon the way in which and the amount in which one wants to conserve production and yet the mineral balance is left in such a way that development will continue and production can be held off for just about as long as one wishes. The trouble in this case is that they were given nothing but milk to drink or an unlimited supply of milk which has resulted in bringing them through rapidly.

Even under those conditions you may be able to carry them through July, August, September, and October all right, and when you develop out a bird at that time or at the size that you have, your egg size is going to be influenced in the same amount, and I don't believe that when you get along in the summer that you are going to get anything at any time except a pullet, a small, or a pee wee, egg, from pullets of this sort. That is, when one stunts the growth of the bird they are apparently at the same time going to control to some extent the size of egg those birds will produce.

Our recommendation in connection with the use of this ration is that a person bring the birds along for the first period just as fast as he can. We are interested, primarily, in making a 1½ lb. broiler, which is about the minimum size that the market will take in just as short a period as it is possible to do so. Just as soon as they are turned off the more the profit is going to be, as the broiler market is always a falling market.

From that time on one can drop out the amount of milk or the amount of meat scrap or whatever is fed as a source of animal protein to them, in such way to control the growth on the birds, which means frame development. In the past when we dropped out the meat scrap, we were dropping out the only source of mineral feed and instead of holding back the birds why we just limited the frame development for them.

It will usually take around about 7 months to grow out a Barred Rock pullet the size that we want to give us an egg that is going to make a good market size.

I wouldn't make a change on the ration for this bunch at the presen. time. Keep them coming right along, since a change at the time that you have that development on them is going to react more seriously than advantageously.—J. B. HAYES.

Chickens Cough

HOARD'S DAIRYMAN:—I would like to find out if there is anything that can help one of my chickens. She coughs every little while, then runs to a pan of water and drinks a great deal. At last she falls over and acts as if she is dying. Is this a contagious disease and is there any cure for it? Do you think it advisable to kill this hen to prevent spreading of disease or is it worth while to try to cure her?

Antigo, Wis. V. D.

The symptoms given in this case are so very meager that one is absolutely not in a position to draw any conclusions from it or to make any recommendations.

In case of a cough in a bird, it usually means some sort of an obstruction in the trachea or the bronchial tubes. The things that might have carried from this are just an infection in there or it may be that the bird has developed canker to such an extent that it has started growing down in the trachea or at the opening of the trachea. This would tend to explain why the bird would endeavor to drink water or why it would occasionally lie down gasping and appear to be dying until it had an opportunity to get a sufficient amount of air.

In this case if a person would just open the mouth of the bird, they will notice that the canker occurs as a white, yellowish, or brown growth or crust-like material occurring in the roof of the mouth, along the edges of the jaw or even at the opening of the trachea.

It is very questionable whether it is advisable for a person to attempt to keep a bird under those conditions. If individual treatment is followed, I would not advise removing this material since apparently it will cause bleeding with the possibility of the disease being spread farther, but rather it is advisable to paint each sore spot with iodine, lysol, or some material such as that and to allow them to dry up on their own accord.

This means, of course, a lot of individual care, and unless the bird is particularly prized, I rather think that one should kill it and then avoid scattering the blood around and burn or bury the carcass.

Under these conditions it might be advisable to give the flock Epsom salts at the rate of one pound to every 100 birds, since it will bring them back into a little bit better physical condition and get at the cause of it, which, apparently, is associated with cold, roup, and those various things of that sort, the predisposing causes of which are damp, drafty, or poorly ventilated poultry houses. It is always advisable to remove birds in this condition and keep them by themselves. If a post mortem examination is made either by the owner or by the veterinarian it would be possible to more nearly diagnose the trouble in that way.—J. B. HAYES.

Wanted—Single assistant herdsman, one single milk room expert, must be clean, fast, kind to cows. Position open last of June. Good opportunity for high class men. De Laval milkers used. $75.00 per month room and board. HORD BROS., Box 728, Mid West, Wyoming.

For bedding most convenient, serviceable and sanitary. Write for prices.
Jagerson Fuel Company, Neenah, Wis.

Free to Calf Raisers

If you sell all your whole milk, write today for our new free pamphlet. It tells how you can raise heifer calves from your best cows with greatest success and least cost. Explains feeding practice as endorsed by the U. S. Department of Agriculture and state animal husbandry authorities. Learn of the profits offered by the "minimum milk method." Simply ask for Bulletin 301, stating number of calves you feed.

Write today to Room 716, 160 N. La Salle St., Chicago, Ill.

Easy Way to Get Rid of Rats

Inexpensive Home System Knocks 'Em Winding —Easy to Use—They Leave Overnight

Rats are more dangerous than disease! They kill livestock, spread disease germs and eat their weight in gold! At last a chemist has discovered a simple remedy that works like magic. You can rid your whole premises of these dangerous pests overnight. Rats seek this delicious remedy, eat it greedily—and leave the house to die outdoors! No offensive odors. Users say it gets amazing results.

The discoverer of this new remedy is so sure that it will quickly rid your place of rats that he offers to send a full size $2 package at the wholesale price of only $1.30. Send no money; simply mail your name and address to Bam Chemical Co., 471 First Ave., Columbus, Ga., and the remedy will be sent immediately. After a week's use, if your rats haven't disappeared, the remedy costs you nothing. This guarantee is ironclad. Write now. (Adv.)

Like to Embroider?

In our June 25th issue we will run a complete color page describing articles stamped for embroidery which you can purchase through the Hoard's Dairyman Fashion Department. Kitchen curtains, vanity sets, children's dresses, aprons, buffet sets, luncheon sets, runners, and pillow cases are definitely described so that you will know just what the articles are. Remember these articles are ready for use as soon as you embroider them.

Watch for Our June 25th Issue!

Herdsman, age 34, single, 10 years experience A. R., general dairy, and calf raising, wishes position with high grade herd. State salary first letter. Address E. H. BROWN, Rockingham, New Hampshire.

Wanted—Position superintendent modern dairy farm or estate. Age 36, married. Fifteen years experience. BOX 314, East Liberty, Pittsburgh, Pa.

New York Champion in Farmers' Division

When a cow makes an average production of sixty-six pounds of butterfat per month for ten months and is only milked twice daily, with ordinary farm care, she deserves a place at the head of the list of profitable producers.

That is just what was done by Crescenda, a pure-bred Guernsey cow owned by G. S. Mawhinney of New York. Beginning her test at the age of nine years and 129 days, she produced 13,154.2 pounds milk containing 661.3 pounds fat in 305 days, and carried a calf for 252 days of that time. This record makes her the world's champion Guernsey for this age and class.—The American Guernsey Cattle Club.

North—"Don't you agree that speed is the curse of America?"

West—"No, I can't say I do. I'm an installment collector!"

MINNETONNA
HOME BUTTER MAKER

A WONDERFULLY efficient butter making machine built on the same working principles as the machines used in large creameries, differing only in size and price.

It gets all the butterfat out of the cream. It churns rapidly so the butter comes in from one-half to one-fourth of the time. By simply throwing in clean water and giving a few turns, you remove all buttermilk. Instead of working the moisture *out*, the MINNETONNA works the moisture *in*, so necessary to the flavor and the keeping qualities, and giving an "over-run" (of moisture and salt) of from 20 to 25 per cent above butterfat test. Hence *more* and *better* butter.

Churning capacity 3 to 12 gallons. Working capacity 3 to 20 lbs. Larger sizes up to 100 lbs. capacity.

Write for description and for FREE 320-page catalogue of Dairy Goods.

CHURNS THE BUTTER AND WORKS IT.

"If—for any reason, the valve chamber on this Milker should be damaged, or get out of order, we will repair or replace it free of charge, during the life of the machine."

What THIS Guarantee Means

19 years ago, the first Hinman Milker carried the above guarantee.

From that day to this, *no Hinman owner has ever had to buy a new valve to replace the original one.*

THIS GUARANTEE MEANS

1. That from the start, the Hinman idea has been to sell *dependable, day-after-day machine milking*—not just a machine.
2. That the Hinman Valve, so simple it hasn't even a spring, *has* to be reliable or we couldn't afford to make that guarantee.
3. That of the two moving parts on the Hinman (aside from power) the only one that needs factory attention to adjust it, is protected by free service *as long as you operate a Hinman Milker.*

Think what that guarantee means! And then get *all* the facts. Find the other reasons why the Hinman is today "the milker most dairymen use."

Send for the Hinman Catalog. Write today.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Exposing Cows to Storms

We have been asked whether it does dairy cows any harm to let them stay out when there is a big thunderstorm and a deluge of rain during the summer grazing season. The inquirer is of the opinion that when cows have been accustomed to run on pasture at all times, from early spring, they become hardy and "tough" so that the heavy rain does them no harm and, indeed, is "good for their skins."

We agree that it takes a "tough" cow to withstand such exposure to the elements. The "big thunderstorm" usually comes on during very hot, muggy weather and, in many of such storms, hail falls or the rain becomes icy cold. It is certain that the sudden chilling of the cow's body, during such rains, is highly injurious. Always it means a serious shrink in milk yield and it may be some days before the cow completely recovers. Besides that, there is great danger of losses from lightning stroke. The cows try to find shelter from the cloudburst. They huddle under trees and there are most likely to be shocked, or they drive before the wind until they are held back by a wire fence and there a lightning stroke may kill them by the score. We have seen terrifying pictures of cattle lying dead by such a fence. The wires should have been grounded at short intervals, but there is little use of "locking the stable door after the horse is stolen." The grounding of wires usually is done *after* cattle have been killed. Do it now!

Dairy cows need shade in the pasture. Milk secretion is greatly retarded by long exposure to the hot sun, on a dry, bare-bitten, shadeless, and waterless pasture and yet it is not uncommon to see cattle suffering in such a place. It would be well were there at least an open shed in every permanent pasture to be used by cows during stormy weather, and when no such shed is available it would seem well to bring the cows in when the appearance of the heavens and the "feel of the air" clearly indicate the approach of a severe thunderstorm.

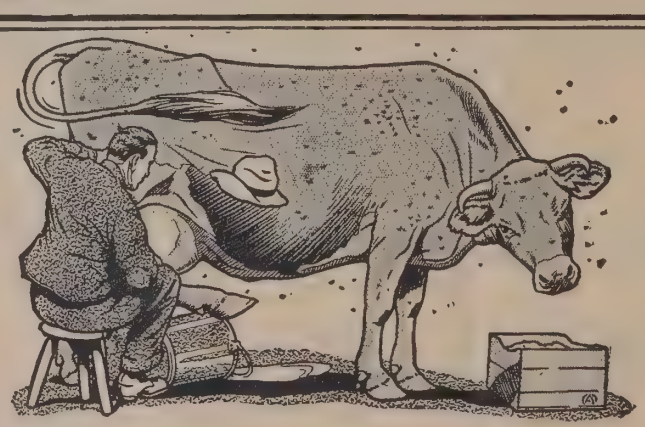
We are strongly of the opinion that exposure to a heavy, cold rain and the added danger from electricity should, so far as possible, be avoided for dairy cows. There can be no benefit and much injury from such exposure. It has even been blamed for causing abortion in some instances and it is during or just after such storms that cows are most subject to anthrax on infected farms; for the water, after a dry spell, activates the germs that have lain dormant in the low places, or washes them on the grass where they may be taken in by cows.

A dairyman who was taken to task by a patron because of the thin, watery quality of the milk he supplied, explained the matter to the newly-wed lady of the house by stating that his cows had been out all night in a heavy downpour of rain and were so saturated that the milk naturally was "thinned out." That, no doubt, was as reasonable to the lady as the explanation of another dairyman to the effect that he put so much milk in the bottles delivered to his customers that the cream had no chance to rise. But, joking apart, the soaking of cows by rain must be considered injurious and causes a shrink in milk yield, but does not add to the normal 87 per cent of water found in milk.

Rudimentary Teats

I have a cow that has a teat on each side of the two back teats. They are about half as long as her teats and are rather in the way when I milk her. Could I remove them while I am milking her or should I wait till she is dry? Could you tell me how they can be taken off?

North Bend, Neb. R. A. D.



The rudimentary teats should be amputated by a veterinarian when the cow is dry. He will then cauterize the ducts of the small secreting glands to prevent leaking of milk. The amputation is done by means of curved scissors, every possible precaution being taken to prevent infection. The cow should be cast or secured in stocks for the operation.

Goiter

I would appreciate your advice as what is best to do with my calves. I have three calves four months old now. One of them has an enlarged throat and breathes quite heavy and for the last few weeks it is not gaining as fast as the other two of its age. I think it may be goiter trouble. I have two more calves about one week old that I also intend to raise and they also have enlarged throats.

Sheboygan, Wis. M. H. F.

The calves have enlargement of the thyroid gland, constituting goiter. To prevent the disease give each pregnant cow 2 grains of potassium iodide daily in water throughout pregnancy and feed alfalfa or clover hay, silage or roots, a well balanced ration of concentrates, and supply

Dr. Hess Fly Chaser

makes cows milkable

They relax. They let down. You get the last drop.

It is long lasting.

Dr. Hess Fly Chaser has the odor of the pines. Because of this odor it serves a threefold purpose:

First—It is the most effective fly and mosquito repellent known to science—quick in action, long lasting.

Second—It is an excellent disinfectant. Therefore, while it is keeping the flies away, it is also destroying the disease germs that attack your cow's body—disinfecting your barns, and injecting into the atmosphere a most healthful odor.

Third—No herd sprayed with Dr. Hess Fly Chaser ever suffers from warbles, which cause a great annual loss to dairymen and farmers.

It does not blister—does not stain the hair—does not taint milk. Applied to the hands and face, it keeps the mosquitoes away.

If Dr. Hess Fly Chaser does not prevent the milk slump, make your cows milkable in fly-time, save your horse-flesh all summer long, it will not cost you one cent.

DR. HESS & CLARK, Inc., Ashland, Ohio

Pipe Smoker Enjoys Can of Tobacco Sixteen Years Old

Railroad agent uncovers can of certain tobacco that had been lying in baggage room since 1910

Of course, all good tobacco is aged before it is packed, but here is a case of "aged in the can."

On the strength of Mr. McDonald's letter we certainly owe our packing department a vote of commendation. For no tobacco could retain its flavor and goodness lying in a dark, musty corner for sixteen years unless it had been properly packed in an absolutely airtight can.

So while someone was deprived of this particular can of tobacco for sixteen years, it did provide smoke enjoyment for an appreciative railroad cashier when it finally came to light.

Mr. McDonald's letter is reproduced below:

Waxahachie, Texas
May 18, 1926

Larus & Bro. Co.
Richmond, Va.
Gentlemen:

The agent while going through his plunder stored in our baggage room came across a can of your tobacco, and account of his not using a pipe he made me a present of this tobacco.

You will note the revenue stamp and your memo which was inclosed. The tobacco was put up in 1910, sixteen years ago. But it was in good shape, of remarkable flavor, and was greatly enjoyed by me.

Thought you would be interested in knowing how your tobacco held out in these days of fast living.

Yours very truly,
(signed) Gordon McDonald.

Pipe smokers prefer Edgeworth for various reasons. Some like it because its quality never changes. Some like it because of its flavor. Others smoke it because they can buy it wherever and whenever they like. Now, Mr. McDonald adds another reason—the quality and flavor of Edgeworth are sealed up everlastingly in the can.

To those who have never tried Edgeworth we make this offer:

Let us send you free samples of Edgeworth so that you may put it to the pipe test. If you like the sample you'll like Edgeworth wherever and whenever you buy it, for it never changes in quality.

Write your name and address to Larus & Brother Company, 15 S. 21st Street, Richmond, Va.

We'll be grateful for the name and address of your tobacco dealer, too, if you care to add them.

Edgeworth is sold in various sizes to suit the needs and means of all purchasers. Both Edgeworth Plug Slice and Edgeworth Ready-Rubbed are packed in small, pocket-size packages, in handsome humidors holding a pound, and also in several handy sizes between sizes.

To Retail Tobacco Merchants: If your jobber cannot supply you with Edgeworth, Larus & Brother Company will gladly send you prepaid by parcel post a one- or two-dozen carton of any size of Edgeworth Plug Slice or Edgeworth Ready-Rubbed for the same price you would pay the jobber.

On your radio—tune in on WRVA, Richmond, Va.—the Edgeworth Station. Wave length 256 meters.

ls. For full particulars study ns on minerals for live stock you can obtain from the state ment station at Madison. Paint largement with tincture of 2 or 3 times a week. Give the h-old calf 5 grains of potas- odide daily in water and the affected calves 2 grains of the laily. Stop the treatment for if the eyes and nostrils start ging.

Penshurst Ayrshires

HEALTH—PRODUCTION—QUALITY
Ours is the first tuberculosis accredited herd in the state and the sixth accredited abortion free. Every cow in the herd is on test. 100 A. R. records made at Penshurst average 14,036 lbs. milk, 567 lbs. fat. Foundation Ayrshires, guaranteed healthy, for sale.
PENSHURST FARM, NARBERTH, PA.

A HIGHLY BRED AYRSHIRE

BULL born, Jan. 16, 1927. Color: nearly all white. Sire: Penshurst Rising Star, 20922, A. R. 260, with 38 daughters having 52 records averaging 10,900 lbs. milk, 440.72 lbs. fat, 4.04%, winners of 3 French Cups, 1 Association Cup, 1 Gold Medal and 6 Silver Medals. Dam: Blanche Woodhull, 2nd, 46862, an exceptionally typy daughter of Leto. She has three A. R. records averaging 11,857 lbs. milk, 462 lbs. fat and three R. of H. records averaging 11,642 lbs. milk, 450 lbs. fat. Six World's Champions in six years.

Purebred Ayrshire Cattle For Sale

Herd headed by a full brother to our two-year-old State Champion heifer, 13,280 lbs. milk, 475 lbs. fat in a year. Dam has 8 A. R. daughters.
WM. NISBET & SONS, Richland Center, Wis.

A Fitting Head for Your Herd

No bull is better qualified to head your herd than an Ayrshire. His daughters will prove deep-milking cows that are an improvement over their dams in both type and production—and Ayrshire milk brings the high dollar.

Even the calves of an Ayrshire bull make market-topping veal.

Herd Improvement Begins When the First Ayrshire Steps on Your Farm.

Write for free booklets and list of herds to visit near you.

A Vest Pocket Herd Book is a good investment

Every Breeder Needs One!

You never can tell when you will meet a man that you can interest in your herd, surplus females or bull calves. Opportunity does not knock very many times and if you can give your prospects a good idea of your herd and certain individuals your chances for sales are much better.

Our Vest Pocket HERD BOOK

is leather bound. It will slip into any pocket. The leaves are removable but held very firm. There's room for 100 head and gestation table, index pages and note pages are also included.

(Cow No. 5 sold May 1st. Cow No. 6 fresh May 1st)

Sold butterfat to creamery	$ 934.14
Sold to five calves (estimate)	20.00
Sold to two Tom cats	7.00
Sold to household 500 quarts	30.00
Left in cans at creamery, natural shrink, spilled, and variation	44.14
Total	$1,035.28

Total value	$1,195.64
Total cost	810.64
Profit	$ 385.00

This is all twice-a-day milking, except a total of 36 days of different cows.

Labor bill looks a little large, but had to do a considerable lot of rummaging last summer to keep cows from starving. Feed cost is considerably higher than usual, due to failure of pastures.

Cows No. 2 and No. 6 are full sisters, and out of Cow No. 1. Cow Nos. 1, 2, and 6 have earned a permanent place, as each has paid for itself before three years of age; so they cost 00, worth $200. Cow No. 3 is hanging on in a very precarious condition, as there are five heifers looking for a permanent home in the herd. Cow No. 4 is on a safe margin, so far. Cow No. 5 was a $75 cow with a $200 pedigree so she was sent bye-bye. There are too many of that kind not only in this county but all over the U. S. A.

One of the important things to consider is the selling of the skimmilk. Porkers at $12.00 per hundred will pay 75c to 90c per hundred for it. In moderate quantities where milk is fed to larger hogs, 35c to 40c is about all that it can be figured to be worth. The difference between failure and success in farming is often found in not having enough hogs to make good use of the surplus skimmilk.

Biblical Butter

Butter wherever it occurs in the Bible is chemah, signifying curdled milk. In Deut. XXXII, 15, we find, among the blessings which Jeshurum had enjoyed, milk of kine contrasted with milk of sheep. Butter was much in use among the Hebrews and was prepared as is done today by the Arabs and Syrians, but it was not used by the Greeks and Romans except for medicinal purposes.

The Arabs of Hejaz put milk in a large copper pan over a slow fire and a little sour milk or portion of the dried entrails of a lamb is thrown in. Milk then separates and is put in a goat skin bag, which is tied to one of the tent poles and constantly moved back and forth two hours. The buttery substance then coagulates, the water is pressed out, and the butter put into another skin. In two days the butter is again placed over the fire with the addition of a portion of burgoul (wheat boiled with leaves and dried in the sun) and allowed to boil for some time, during which it is carefully skimmed. It is then found that the burgoul has precipitated all foreign substances and that the butter remains quite clear at the top. This is the process used by the Bedouins, and is also employed by the settled people of Syria and Arabia. The chief difference is that, in making butter and cheese, the townspeople employ the milk of cows and buffaloes, whereas the Bedouins, who do not keep these animals, use that of sheep and goats. The butter is generally white, of the color and consistency of lard, and is not much relished by English travelers. It is eaten with bread in large quantities by those who can afford it, being taken in a mass with a morsel of bread and not spread as with us.

The butter of the Hebrews might have been sometimes clarified and preserved in skins and jars as at the present day in Asia, and, when poured out, resembles rich oil (Job XX, 17). It acquires a rancid taste that is liked by the natives. All Arab food considered well prepared swims in butter and large quantities are eaten independently of other food.

Butter and honey were used together and were esteemed among the richest productions of the land (Isa. VII, 15) and Arabs use cream or new butter mixed with honey as a principal delicacy.

The Alberta Dairy Pool

In its first year of operation, 1926, the Alberta Co-operative Dairy Producers, Ltd., Edmonton, received from its members 2,575,565 pounds butterfat, for which the members received $814,962, or about 32 cents a pound. From this quantity of butterfat the 12 creameries manufactured 3,118,700 pounds of butter which was sold for $1,039,927, an average of about 33 cents a pound. Cost of manufacturing came to $235,821, and the net loss was $5,057.

Early in the year the management of the new organization realized that it was to be forced to meet competition and decided to limit the operations of the Pool to 12 creameries. Two of the 12 did not operate as Pool creameries until May. This resulted in a lower average price for the year as prices are high during the first four months.

At the beginning of 1926 the membership stood at 3,547, and at the end of the year it was 6,456, a gain of 2,909. Most of the organization work was done in the territory surrounding the 12 creameries.

Numerous requests and petitions for Pool facilities have been received during the year and because of these demands the board of directors is negotiating with certain commercial creameries to operate as Pool creameries this year. The first step toward ownership of creameries has been taken at Eckville where a creamery is being built.—Agricultural Co-operation.

Old Lady: "You can't be so poor, my good man, if you wear spats."

Tramp (sadly): "Ma'm, these are suede shoes with the soles worn off."

HOARD'S DAIRYMAN FARM
FORT ATKINSON WISCONSIN

ANTON'S KING CONFIDENCE—43517 A. R.
Photo taken when two years of age.

SIRE—Anton's May King, sold for $7000.00. DAM—Ma Chere Confidence who has a two year old record of 511.82 lbs. butterfat and a junior four year old record of 764 lbs. butterfat. Ma Chere Confidence is one of the outstanding daughters of the famous Jardinier's Masher. A. K. C. sires excellent udders, long deep bodies, straight top lines, and real production. His first nineteen A. R. daughters average 8739.4 lbs. milk and 422.8 lbs. butterfat on two time milking and herd rations at the average age of three and one-nineteenth years.

TILLAMOOK DAISY
BUTTER KING
DE KOL

"The highest record National Champion of our breed or in fact of any breed is Tillamook Daisy Butter King De Kol. She has a 7-day record of 815.1 pounds of milk, 31.38 pounds of butter, and as a senior 4-year-old made the splendid yearly record of 32,488.4 pounds of milk, 997.40 pounds fat."
—*Type And Production Book.*

You Can Buy Her Full Brother Or Her Line Bred Son

We have been using the full brother of Tillamook Daisy Butter King De Kol on our herd. We believe he is as desirable a bull as can be purchased for the man who wants type and production, and wants to invest less than $1000 in a herd sire. His first daughter to freshen in the Carnation herd is milking 100 pounds a day right now. He was seven years old on May 15th.

We are using the son of Tillamook Daisy Butter King De Kol (sired by her sire) on our herd right now. We don't use a bull unless we know a good deal about him. This bull is as near an ideal herd sire as can be purchased at any price. It will pay you to investigate this bull.

We have followed five generations of this breeding, and we have yet to see one animal that is ordinary as a producer or as an individual in the entire five generations.

There is seldom a chance to buy a bull like this—fully guaranteed and bearing the stamp of our highest recommendation.

The Surge Milker

Which would YOU rather wash?

ANY salesman will tell you that his milker is easy to clean *but* — he is not going to be there to wash it for you. You have to do that yourself. So why not judge for yourself! Don't buy any milker until *you* have taken it all apart, washed it thoroughly, and then put it all back together again. When you have done that a few times you'll know—and not until then! Once you you have washed The Surge Milker you will not be interested in an old-fashioned milking machine with a lot of rubber tubing and twisted claws to wash. Don't just take our word for it — *try it!*

Above you see an old-fashioned milking machine with claws and long tubes. Look at the chances for bacteria—"bugs"! The milk washes around in the teat cup and then flows past several joints into the claw. By this time it has probably gathered a good many bugs. But the worst is yet to come—the trip through the long milk tube—3 feet of constant exposure to bacteria! Finally the milk reaches the pail after having washed 4 feet of rubber. Contrast that with The Surge Milker shown to the left above. NO Claws! NO Long Tubes! Milk travels ONLY 4 scant inches from teat to pail. A short, direct, *clean* route!

The Surge Milker

The Surge Milker is EASY to clean. NO claws! NO Long Tubes! It can be taken ALL apart, easily, in 20 seconds, washed in 3 minutes and assembled in 30 seconds. *Because* The Surge is so easy to clean it IS washed after every milking as it should be. *It is not neglected.* That's why average farms under average conditions are producing clean milk every day with The Surge. And that's why we guarantee clean milk and premium prices with The Surge.

Bear this in mind: To produce *clean* milk ANY milker must be taken ALL apart and washed *clean* every day. Mere rinsing, dipping in sterilizing solution or sucking water or sterilizing solution through by means of any "circulation system" is NOT ENOUGH! That's why we say—before you buy any milker be sure to see how much of a job it is to wash and clean!

No milker with long tubes and claws *can* be as easy to clean as The Surge. Surge owners never have any bacteria trouble. They get premium prices every day for their milk. Don't buy any milker until you have seen the famous "Easy-to-Clean" Surge Milker.

Read This:—

"I have used .... and .... machines (*both* Long Tube Claw-Type Milkers). I find The Surge far easier to keep clean, and I can produce a higher quality of milk." — G. Schmidt, Lenexa, Kansas.

Tractors Prefer Polarine

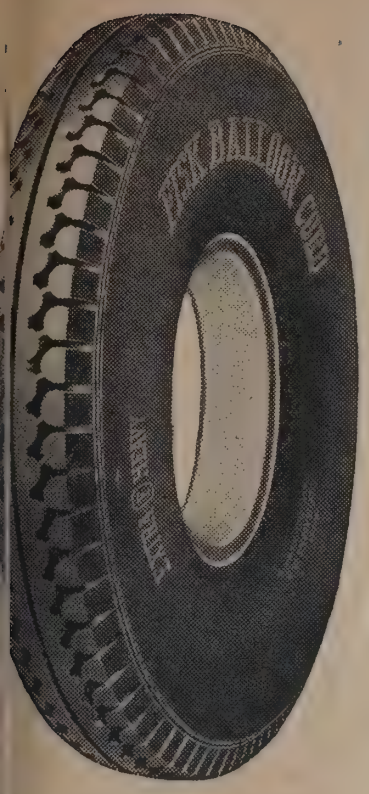
THE PERFECT MOTOR OIL

If you have used Polarine, you know they do. If you haven't, try it and see for yourself! A tractor lubricated with Polarine pulls away steadily, willingly — while a tractor that is not properly lubricated complains of the oil by doing poor work.

Of course, a tractor isn't alive like a horse—but it requires good treatment just the same—and rewards you for it! If you will lubricate your tractor with Polarine and see that the oil is changed every two weeks—or better still, every week—you'll get good steady work out of your machine.

With a tough film of oil over all the fast-moving surfaces, Polarine protects the engine from the grind of grit and the heat of friction. When the oil becomes thin and dirty, it is no longer able to protect the engine and fresh Polarine is needed. That is why it is important to give the lubrication of your tractor regular attention — to change the oil every week or two.

If you give your tractor good treatment — lubricate it regularly with Polarine—it will reward you by working well — and lasting long. Tractors prefer Polarine — and it pays to give it to them!



For years Polarine has lubricated the tractors on farms throughout the ten states of the Middle West. For years it has given faithful, dependable lubrication service. Farmers know that they can count on Polarine to do a thorough job of lubrication—that it is a *uniform* product, always the same, always satisfactory — with the solid reputation of the Standard Oil Company (Indiana) behind it. Polarine is a good old stand-by that gives maximum lubrication at a minimum cost.

To get Best Results — change your motor oil at frequent intervals.

For correct grade consult chart at Any Standard Oil Service Station.

Standard Oil Company, 910 S. Michigan Ave., Chicago

The Magic of Milk

The Aryans, one of the earliest races of man, believed in the actual existence of a magical cow who produced not only milk but also yielded healing herbs, ambrosia, and precious gems.

Our ancestors 3,500 years ago thought of all good spirits in the world as cows. The Dawn was mother of the Sun and it was her milk that nourished him. These were the "white cows" while the storm clouds were evil spirits called "red cows."

Greatest of them all was the moon-cow, giver of abundance. They could see her gold tipped horns as the new moon came, or as the old moon passed out. The sky was a great verdant pasture. The star-cows were the five-horned cattle of the heavens. Across the sky then flowed the great stream of heavenly milk, "The Milky Way."

The cow was worshipped in Babylonia and Tyre 2,000 years B. C. The moon was identified as a cow in the cow-headed goddess called Hathor with the round moon between her horns. She watched the fertility of the land. The Nile was likened to a milk cow and the fertilizing water which it spread over the soil to the milk that sustains human life. Hathor caused the river to overflow.

David had 10 cheeses in the pack of provisions he was carrying to the army just before he challenged and slew the Phillistine giant, Goliath.

In India today milk is sprinkled over the heads of the newly married couple in blessing, and upon those of mourners to soften their sorrow.

The most popular method of beauty culture among the Romans was to rub the face with pieces of bread soaked in milk. Both butter and milk were used as medicines from Roman times through the Middle Ages.

In the heart of Africa, Uganda, the tribal cows are so holy that they can be milked only when the precious fluid is cared for with the most elaborate ceremonies.

On the Sahara Desert, people live almost entirely on the milk and milk products of their grazing herds, (goats, camels, sheep). An Arab boy is as lithe and straight as the ideal athlete. Milk and its products give him the courage and the physique to meet and conquer the many hardships of his life.

In Japan where milk has been as little used as anywhere in the world, people are short in stature and their span of life brief. Japan has recently bought dairy cattle hoping that the Japanese of the future will grow into "great big boys."

Among the hardiest races of Europe are the Scandinavians, the Alpine Swiss, and the Scotch English. All three have always been users of dairy products.

Cattle did not exist in America until Columbus, on his second voyage in 1493, brought a few from Europe to the Island of San Domingo.

When the Pilgrim Fathers first set foot on Plymouth Rock, they brought no cows and during the first two years paid dearly for the lack with the deaths of many young children.

Later pioneers remembered the lesson. As they pushed ever westward to the new frontier, the cow went with them. Oxen, sons of the cow, drew the covered wagons and behind each wagon followed its two or three milk cows.

Recently in Bulgaria a son of seventy-odd testified along with his father that they attributed the patriarch's hundred and twenty years, authenticated by the Bible in the village church, to the milk he had drunk daily since childhood.—From "The Path of the Gopatis" by Zilpha Carruthers published by the National Dairy Council.

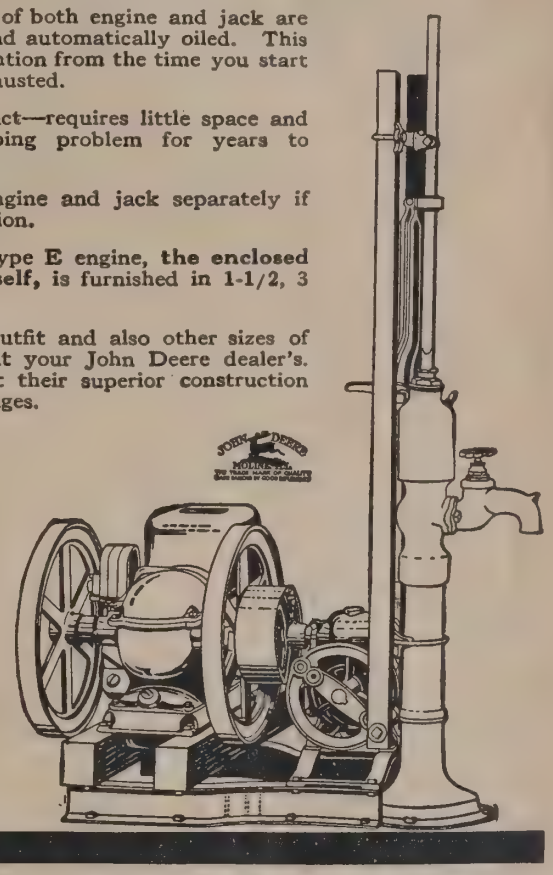
Solves That Water Pumping Problem

Whether the winds blow or not, you can always have plenty of fresh water for your stock—with no loss or time and no hard work if you have a

JOHN DEERE PUMPING OUTFIT

This consists of a John Deere Type E 1-1/2 H. P. engine and a John Deere Direct-Drive Pump Jack.

You can use it anywhere—in the barnyard—out in the pasture—right among the stock. It requires no enclosure. There are no belts or chains to endanger stock. The jack is driven directly from the fly wheel of the engine.



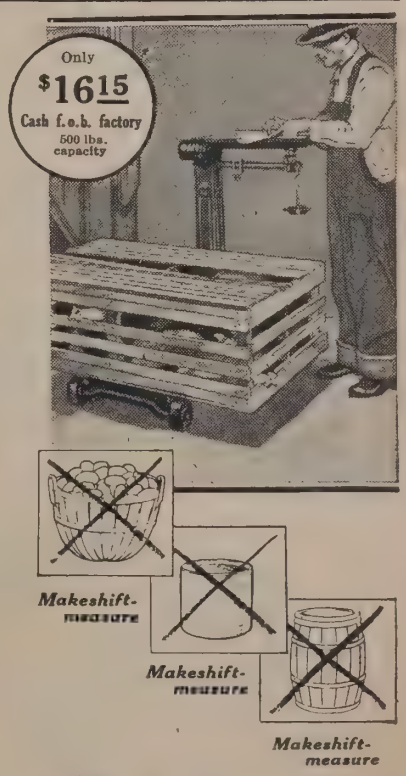
The operating parts of both engine and jack are completely enclosed and automatically oiled. This outfit requires no attention from the time you start it until the fuel is exhausted.

It is simple, compact—requires little space and will solve your pumping problem for years to come.

You can get the engine and jack separately if desired for belt operation.

The John Deere Type **E** engine, **the enclosed engine that oils itself,** is furnished in 1-1/2, 3 and 6 H. P. sizes.

See this pumping outfit and also other sizes of John Deere engines at your John Deere dealer's. You are sure to want their superior construction and operating advantages.



Write for Free Engine Folder

Tells all about John Deere engines and this special pumping outfit. Write to John Deere, Moline, Ill., and ask for booklet WT—814.

GOOD-BY "makeshift-measure!"

Isn't it time to think of farm products in terms of cold dollars and cents? Isn't it time to measure them just as accurately as the money you get for them? 344,679 car owners say Buick will be *their* next ca

A GENERAL and impartial survey of automobile owners recently conducted by a great organization, shows that 344,679 owners of other cars intend to change to Buick next time they buy a car.

These owners have compared their cars with Buick —in performance, in economy, in comfort, luxury and dependability. And they have decided that Buick offers greater value.

They have driven Buicks, and know how flexible Buick is in traffic, how easy it is to park, how effortlessly it takes the hills and how it responds instantly to the slightest pressure on the throttle.

They marvel at the efficiency of Buick's powerful six-cylinder Valve-in-Head Engine, which is *vibrationless beyond belief* at any speed.

And in all probability, a majority of those who intend to buy Buicks have been influenced in still another way—by the actual experience of their friends who are Buick owners.

Examine a Buick at your earliest opportunity. Find out why so many owners of other cars are changing to Buick every day.

Copyrighted 1927. W. D. Hoard & Sons Co.

olume 72 FORT ATKINSON, WIS., JUNE 25, 1927 Number 12

LAND O' LAKES LEADS DAIRY CO-OPS.

JOHN L. RICHARDSON, WASHINGTON, D. C.

UILT upon a firm foundation in the form of a sound and substantial system of local co-operative creameries, the Land O' es Creameries, Inc., today stands he leading successful co-operative butter marketing organization in rica. It has only been after forears of growth and development this organization has been able each the envious position it now holds.

arting with the establnent of the first local coative creamery at Bis- McLeod County, in , a movement was inid that has resulted in ing Minnesota far out in t of all other states in country as a producer of er and a home of sucful co-operative cream- Although the co-operie movement started at a t date in Minnesota than ome other states, it has constructed on sound fundamental principles have given it stability momentum, enabling it ithstand the tests of time. veral creameries of this were established in nesota in 1890, and with- period of ten years over creameries were organ- in that state. Several res have resulted but number is relatively l in comparison with e in neighboring states. large majority of cases been successful, how-, and the first creamery olished is still in operaIn 1921 there were 645 perative creameries in nesota producing 67.1 cent of the total output utter of that state.

ardinal Principles of Co-operation

corporated in the by- of the first co-operative mery established in nesota were three cardinal prins of co-operative effort that not only endured but have ed the basis for practically all he successful organizations that followed. These rules are: one per member; paying only the g rate of interest on money ind by stockholders; and prorathe profits of the business among patrons in proportion to the busifurnished to the association.

e theory that a thriving local is fundamental in building a g co-operative organization has substantiated by the experience he Minnesota creamery move-. The rather dense population ows in that state has enabled the meries to secure ample volume of business within the radius of from three to five miles which has tended to build up a strong community relationship.

Procedure in organizing the local creameries has been very significant in explaining their success. When agitation for a creamery was started in any community, the first move was to make a preliminary survey. The purpose of this survey was to determine if enough farmers having a sufficient number of cows were willing to take membership or stock in the venture. If this investigation resulted favorably, a temporary organization was perfected for the purpose of creating a permanent organization. They then set out to sign up the necessary farmers as members, but no one was held to his contract unless a sufficient number of signers were secured to start operation.

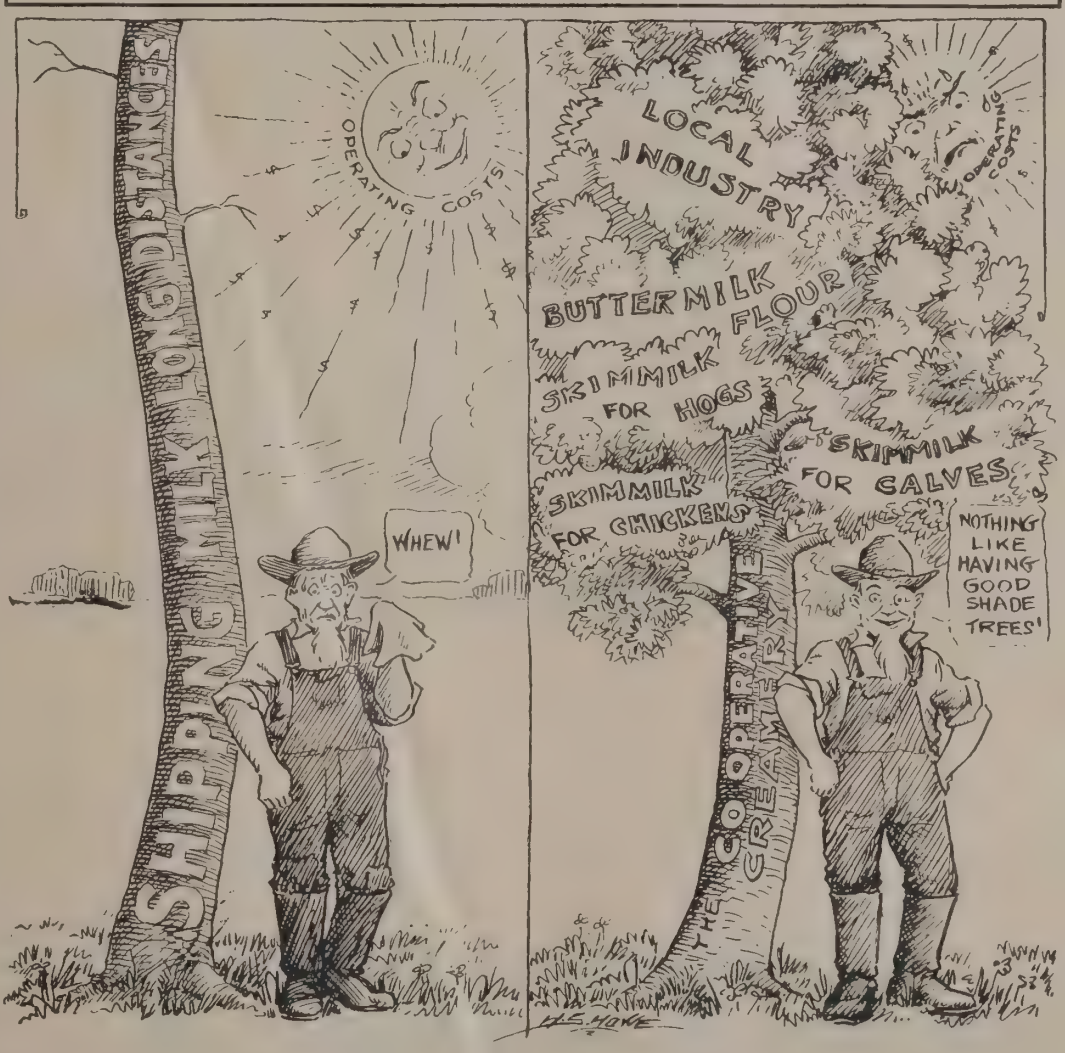
Federation of Locals

Local co-operative creameries in Minnesota have, until recently, marketed their butter individually and independently. That is, each local has built up its own trade and has in no way been connected with other locals.

After a few unsuccessful attempts, a movement was initiated in April, 1918, which set the stage for a statewide creamery organization. At this time a group of local co-operative creamery men met in McLeod County to consider plans for a marketing program. The proposal met with favorable response, but it was decided that an actual beginning should be postponed until at least 200 creameries signified their intentions of becoming members of this marketing organization. On the call of A. J. McGuire, dairy extension specialist of the Minnesota Agricultural College, representatives of over 300 co-operative creameries met in St. Paul and perfected the Minnesota Co-operative Creameries' Association on June 7, 1921.

The Land O' Lakes Association, which is an outgrowth of the Minnesota Co-operative Creameries' Association, is a typical federated form of co-operative enterprise. It is a co-operative stock corporation, the stockholders being approximately 475 local creameries, 26 of which are located in Wisconsin. Headquarters are maintained in Minneapolis, and branch offices are located in New York, Philadelphia, Chicago, and Duluth. The area in which the member creameries are located is divided into 16 districts with a manager for each. The duties of these district supervisors or fieldmen are twofold. First, they are to assist the managers of the local creameries to improve the quality and uniformity of the butter produced. Secondly, they supervise the assembling of butter produced by the local creameries into carload lots for economical shipment. In order to qualify for a position as district manager these men must be expert buttermakers, which will enable them to give helpful advice to the local buttermakers. They must also possess the ability to gain the confidence of all the members and buttermakers within their territory.

Develop Merchandising Plan



Prior to 1924 the co-operative creamery movement in Minnesota had been a co-operative producing enterprise. Marketing had not come in for a great deal of consideration. Two reasons have been given to explain why a centralizing selling agency had not been developed. In the first place, many local managers had been unwilling to give up the function of selling the butter; while, secondly, many authorities felt that standardization had not been perfected to the point that would give a satisfactory product for centralized marketing.

At a meeting of the executive committee of the Minnesota Co-operative Creameries' Association in September, 1923, plans were worked out for the marketing of the butter co-operatively. It was at this time that specifications were made for the grading processes which would stimulate the making of high grade butter. Besides adopting a program for the improvement of the butter, other plans were made for expanding the merchandising activities and for the development of markets in cities other than New York and Philadelphia where most of the butter had been going.

Several important points were set forth in this new program. In order to standardize the butter produced by the local co-operative creameries, it was necessary to have it concen-

THE LONG AND THE SHORT OF IT

A WEEK IN PENDLETON COUNTY, KENTUCKY

E. M. CLARK, ILLINOIS

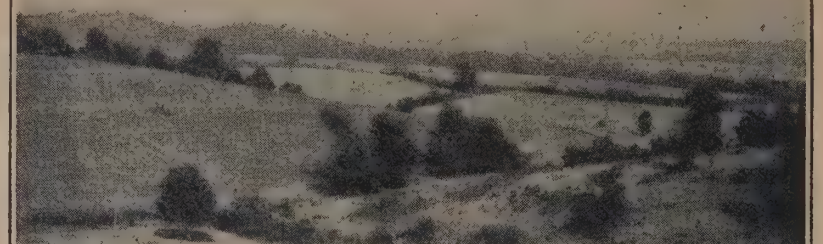
THE Irishman who said that land in America was so plentiful that they had to pile it up must have had reference to Pendleton County, Kentucky. During my week's travel on foot and by auto in that county, assisting in a better dairy sire campaign, no wide, fertile valleys or verdant prairies were encountered. It's all hills and narrow valleys down there. I wondered how the farmers could eke out a living on those steep hillsides. My first impression was that if I ever was to become a county agricultural agent I surely would be competent to give sound advice to these farmers. I would advise them all to move out. But I found that C. L. Hill, the county agent, was not giving out the advice that I thought was so clearly needed. In fact, before the week was over he convinced me that the farmers were prosperous in Pendleton County and their prosperity was due largely to those old hillsides rather than in spite of them.

The "Noxious Weed," Sweet Clover

Here's the secret: Limestone abounds in the hills. Years ago sweet clover discovered these sweet old hills and despite every effort on the part of the farmers this "noxious weed" virtually "took" all the farm land except the narrow, crooked valleys. It was thought that "nothun" would eat it and the farmer was doomed.

The Honey Bee to the Rescue

Just about the time when the farmers were in deep gloom in the losing fight they were waging against their arch enemy, someone discovered that honey bees were sipping the nectar from the sweet clover blossoms. Why not go into the honey business and make some use of this "weed?" So into the honey business the farmers went. Pendleton County is now the leading honey producing county in Kentucky. Thanks to our friend, the enemy, sweet clover. While every cloud may have its silver lining, yet that silver lining might become slightly tarnished. So it has been with the honey business. The honey bee proved to be the silver lining to the dark cloud which sweet clover had cast on Pendleton County. Recently "foul brood" has tarnished that silver lining. Heavy losses have been experienced. One farmer who had about two thousand dollars worth of bees lost all of them. In their characteristic fighting fashion the farmers are now warring against "foul brood." It seems as though there is always some pest waiting to take the joy out of life.



Enter Queen Alfalfa

Some of the leaders in the county reasoned that if sweet clover was so anxious to grow on those old side hills, maybe alfalfa would also grow. It was given a trial. The results exceeded all expectations. Today Pendleton County is the leading alfalfa producing county in Kentucky. All that is necessary to get a good stand of alfalfa on the hill land is to sow the seed. No limestone to spread—mother nature did that centuries ago.

Live Stock Development

With the production of large quantities of choice alfalfa hay, sweet clover, and bluegrass has come a gradual increase in live stock production. Yet there is an insufficient number of animals raised to consume all the roughage produced. About two hundred carloads of hay are shipped out of the county each year. It is true this makes a good cash crop yet it is believed that this hay could be marketed to better advantage through more live stock. County Agent Hill says, "When the good Lord made Pendleton County he intended it to be a live stock district and that's what we intend to make it."

Sheep growing is becoming more popular and is proving profitable.

A TYPICAL LANDSCAPE IN PENDLETON COUNTY, KENTUCKY

The "standard Kentucky lamb" commands a premium on the market. Kentucky wool is famous for its splendid quality.

At present not many hogs are raised. An effort is being made to grow at least enough pork for needs within the home. The small acreage of corn will always prevent this county from producing a large number of hogs.

Poultry raising and egg production are increasing rapidly and help to swell the farmer's income.

Light Burley Tobacco

Nearly every farmer in Pendleton County raises light burley tobacco. Some years this is a very profitable crop while at other times a lot of money is lost. It's quite a gamble, so we have found,—this tobacco raising business.

Milk for Cincinnati

Good roads have brought the Cincinnati market to the very doors of the Pendleton County farmer. Milk trucks run daily over the county's pikes, gather up the milk and rush it to market. The dairy business in Pendleton County is an "infant industry" yet in its swaddling clothes.

Sufficient corn can be grown for silage and grain. The combination of silage and alfalfa makes winter dairying profitable. Sweet clover and bluegrass furnish abundant pasture.

The Pure-bred Sire Campaign

County Agent C. L. Hill—they call him "High" down there and he is "High" by both name and nature—decided that the scrub and grade bull should be banished from the hilltops and valleys of his domain. Poor, nondescript boarder cows were being brought into the county by the hundreds and sold to the farmers. It seemed as though the farmers would buy anything that would give milk. Careful scrutiny on the part of the writer did not reveal any milk goats, but many animals called cows looked as though they did not produce more milk than a good goat. So "High" decreed that pure-bred bulls must be used and the best heifers raised. He enlisted the help of Ed. Prewitt, Dairy Extension Specialist of the State University. A plan was developed. A survey was made of the county through the aid of men elected in each school district. The survey revealed the fact that 1 scrub and 76 registered bulls were being used. The name and address of every man using a scrub bull was obtained. The next step was to send each of these men using scrub bulls a circular letter, in fact three letters on the subject of better breeding.

"HIGH" HILL, PENDLETON COUNTY'S AGRICULTURAL AGENT
He is "high" in stature, has "high" ideals, and travels in "high."

The week of March 1 was set for the launching of an intensive campaign. Fieldmen of the breed associations, a railroad agriculture agent, a representative of the United States Department of Agriculture and extension men from the University were present to help. The campaign started off with a banquet given by the business men in Falmouth. Farmers were invited to this banquet and were convinced of the wisdom of the movement.

A Day in the Hills

It's doubtful if there is a stretch of road in the county that is straight for more than three hundred yards. The roads follow the ridges and valleys and the old saying that "the longest way 'round is the surest way home" was invented in Pendleton County. Starting out one morning I asked my driver how far it was to our first "prospect." He said, "Why as the crow flies it's about three miles, but about twelve miles by road." On the way out we picked up two farmers who wanted to go with us and help us on our mission. Now, Jasper, our prospect, lives on a dirt road near the river so it was decided to leave the car on the state road and walk cross lots to Jasper's farm—a distance of about two miles up hill and down, but mostly up. Jasper's home made a beautiful picturesque sight nestled down among the trees on the river bank, the blue smoke curling out of the large stone chimney,—a sight that was worth walking two miles to see even if Jasper was using a scrub bull.

We didn't venture too close to the house as several dogs put in an appearance. The dogs' barking brought Jasper to the door and he assured us that none of his nine canines friends would harm us. We entered and drew up chairs around the sheet iron stove placed in front of the old, walled-up fireplace. Why in the world do these Kentuckians stop so many beautiful fireplaces by walling them up and using stoves? I say be it's easier to heat their homes that way but many a home owner would give his eye teeth for those unused fireplaces.

Well, after we had passed the time of day and talked about the weather we gradually brought Jasper around to our subject of better bulls. Much to our surprise Jasper fell right in with the idea and agreed he needed a better bull. He promised that his next bull would be a registered bull but he would need some help in locating and buying the animal he needed. We told him that "High" Hill would help him. Jasper was not required to "sign" anything as some of us have a pet aversion to "signing."

And so we traveled on, visiting farmer after another day after day until all those who had scrub bulls had been seen. The results were very gratifying. Nearly every one agreed to buy a registered bull or agreed to sell his scrub bull and go into partnership with his neighbors and buy a community bull. At the end of the week we totaled up the results of our combined efforts and found that we had orders for 104 bulls.

Holstein National Totals $27,975

SEVENTY head of Holsteins were sold at Springfield, Mass., June 2, the day after the annual meeting. A good crowd was on hand and although the animals were not quite as desired for a national sale, an average of $399.60 was received.

Harry Yates' eight-year-old cow, Cattaraugus Flora Colantha, topped all consignments, bringing $1,225. She has a record of 1,022.5 lbs. butter and is sired by John De Kol Colantha, a son of Colantha Johanna Lad 8th. Her dam is Cattaraugus Mildred Paladin Burke, an untested daughter of Paladin Trilby Burke. John Tuck of Massachusetts purchased her and Quonquont Farms were runners-up. Wisconsin Bess Ormsby Johanna, a daughter of Sir Pietertje Ormsby Mercedes 37th, with 1,037 lbs. butter, from the Detroit Creamery herd, was the second highest female. She went to Quonquont Farms, Massachusetts, for $1,100.

Hollyhock Farms consigned the most desired male. This animal was Sir Bess Ormsby Fobes 63rd, a son of Sir Bess Ormsby Fobes and out of

SIR BESS ORMSBY FOBES 63RD, TOP-PRICE BULL AT NATIONAL HOLSTEIN SALE

He was consigned by Hollyhock Farms, Wisconsin, and sold to D. D. Aitken, Michigan, for $1,200.

HOW EUROPE FARMS

A General Farm of Holland

HERBERT R. COX, NEW JERSEY

Dr. Mansholt spends much of his time experimenting with different varieties of field crops.

IN the last two stories we have introduced to you a Dutch dairyman and a Dutch potato grower. When we have presented a general farmer we have covered the three principal types of farm in the kingdom of the dikes. Bulb growing is, of course, a distinctive industry in this land but it does not figure largely in total financial returns.

No people perhaps in all history have so altered the character of their land in the interests of agriculture as have the Dutch. Nearly 40 per cent of the country is within three feet of sea level or below sea level and would be inundated if the sea broke through the barrier of dunes and dikes. Much of the reclamation was done centuries ago and is a lasting memorial to the able Dutch engineers of the Middle Ages, at a time when the rest of Europe was engrossed with the quarrels of various kings and which was the correct and simon-pure method of worshipping the Almighty.

Reclamation has proceeded from that time to the present and will continue into the future, for have not the audacious Dutch perfected plans and made a beginning at draining the Zuider Zee so that fifty years hence it will occupy only about a quarter its present area?

Something like fifty years ago a polder was formed from the North Sea in the province of Groningen in Northern Holland by the approved Dutch method of ditching and diking. One of the first men to take up farming in the new polder was a man named Mansholt, an immigrant from Germany. Today his grandson, Dr. R. J. Mansholt, operates this same farm of 140 acres. Dr. Mansholt is a general farmer, that is, he raises a variety of field crops with just enough cattle and sheep to balance the system. The crops raised are wheat, barley, oats, peas, beans, rape, mustard, caraway, flax, white clover, red clover, sugar beets, poppy (for oil), and potatoes. Practically all of these crops are raised for seed. He keeps 14 head of dairy cattle, 20 sheep, 60 chickens, and 9 horses.

The land on this farm is valued at $500 an acre including the buildings. How can land devoted to field crops justify such a high valuation one may ask, which is a legitimate question for a farmer who is content with 35 bushels of corn and 18 bushels of wheat to the acre. The answer is: The average yield of the crops raised on this farm are—wheat 58 bushels per acre, barley 74 bushels, oats 120 bushels, peas 61 bushels, field beans 64 bushels, sugar beets 16 tons.

This farm is in most respects typical of the province in size and in the kind of crops grown. Most of the farms are well tilled and the region is prosperous. In one respect, however, this farm is not typical, and that is in the kind of man at the head of it. As mentioned above, Dr. Mansholt raises crops largely for seed. For years he has been carrying along simplified breeding and variety trials, all for the purpose of improving the strains he grows. He is continuously striving for better seed. These seeds he makes available to his neighbors, who take practically his entire output and at a price 50 to 70 per cent higher than market price for the products. He has his farm so organized as to permit him leisure to conduct experiments.

Racks of this kind are used on this farm to stack hay and grain in the field so air may circulate freely.

This man was born on this farm and has lived here all his life, excepting for the years spent at the University of Wageningen of which he is a graduate. Recently the University of Groningen recognized his services to agriculture by conferring upon him the honorary degree of Doctor of Science. Here is the case of a man of unusual ability who is devoting his life to the improvement of farming and at the same time making a commercial success. What could be more satisfying?

This is a much larger farm in terms of gross sales than the acreage would indicate. There are 12 men hired throughout the year; and at the weed pulling and harvesting seasons as many as 50 workers are employed. For weeks the laborers go through the crops before harvest and pull out the weeds. Scarcely a weed is to be seen on the farm. In addition to this, the proprietor has the most modern cleaning machinery operated by power. Also, he has his own threshing machinery, several sets of them. There are machines for treating the grain for smut and other diseases. There is also a twenty-five horse-power tractor. With all this modern equipment, however, the crops are harvested by hand with scythes. Dr. Mansholt finds that he can produce better seed by this method of harvest; also, he has an abundance of labor during the harvesting season, anyway.

No regular rotation is practiced, excepting that two cereals are not grown in succession.

The top of the dike that borders the North Sea and prevents the sea from overflowing Dr. Mansholt's Farm.

A great deal of fertilizer is used, a phosphate, nitrate of soda, and a l tle potash, which is purchased se rately and applied according to t needs of the crop. He is also beg ning to use calcium nitrate. As t polder is comparatively new, there not much need as yet for potash a lime. A field is treated with sta manure every six years. This ap cation, together with the clover, pe and beans grown, seems to maint the land in high production. T grain straw, of which a large qu tity is produced, is sold in bales t farmers' co-operative factory manufacturing into paper.

Dr. Mansholt has a wife and f children. The house is spacious, a immaculate like all Dutch houses. buildings are equipped with elect light and with electric power to op ate the machinery. He has a mo car of a well known American mak

This farm which is about one f above sea level borders the North S A dike protects the farm, of cou from inundation. Dr. Mansholt, in operation with his neighbors who h der the ocean, has taken steps wrest still more land from the This consists of the preliminary s of running ditches about twenty apart from the dike directly into sea. The tides and waves bring in silty water. The silt is deposited the water drains off in the ditc Eventually a new dike further will be built and another strip of l will be added to the Kingdom of H land.

Holstein Breeders Re-elect Lowden—Milwaukee Chosen for 192

THE first Wednesday in June is annually designated by Holstein-Friesian breeders as the time for their annual meeting. The 1927 meeting was held at Springfield, Mass., the same state which cradled the association from its beginning in 1870 to its time of incorporation at Syracuse, N. Y., in 1880. Secretary Houghton's report informs us that this year's meeting was the 57th meeting and the 42nd annual meeting.

The open discussion which always takes place the day before the meeting brought many helpful opinions to the surface which might not have escaped the lips of their originator had the custom of other breed associations been followed. Breeders, delegates, friends, and bystanders may take the floor at these gatherings and the general result is very satisfactory. Everything is discussed and impediments for legislation are decreased or increased according to the desirability of the idea. The herd test, the 14-day lapse after freshening before a 7-day record may start, the Extension Department, and the report of the special committee on selective and superregistration occupied quite largely the time devoted to Holstein affairs. The pro and con arguments were very enlightening in a majority of instances and helped the delegates clear up any hazy points that might exist.

The banquet was so well attended that the large dining room of the Hotel Kimball proved insufficient, a large overflow having to be taken care of by extra tables placed in the lobby and in other dining rooms. The hope that Ex-governor Lowden would voice his personal opinion regarding his entering the 1928 presidential race brought many local citizens. His silence on this question caused, as usual, many different viewpoints.

This year's meeting was largely centered around three main problems: (1) a reliable herd test or herd improvement plan; (2) report of committee on selective and superregistration; (3) period between freshening date and starting 7-day test. Many breeders had not paid much attention to the herd improvement idea (which means testing the whole herd) until facts and figures were presented showing that the pure-bred cow has been challenged. Some voiced the idea that a great many pure-bred owners were hesitant to place their herds in a cow testing association because of the keen competition that might be present. Statements such as this have more than an atom of fact. More general testing is needed not only by the Holstein breed but by every breed. (The Ayrshire breeders already have a herd test.) It is a practice to test "the good cows or heifers." This is really deplorable and cannot last if a sincere desire for breed improvement exists. A committee consisting of several Holstein breeders and five or six state experiment station authorities was appointed to formulate a herd improvement plan and present same to the Board of Directors when they convene at Memphis this fall. Hoard's Dairyman believes this move to be a step in the right direction and hopes the committee will secure the utmost co-operation.

The report on selective and superregistration brought forth considerable debate. Nearly everyone believed the idea in general to be highly desirable. The whole matter was settled by receiving certain parts of the report and omitting the working principles and requirements. When the convention convenes at Milwaukee it is hoped that more time will be dev to superior classes and a work plan submitted. The plan submi at Springfield included Excellent, perior, and Gold Medal sires, eac have ten daughters meeting spec physical requirements in the first classes and also meeting produc requirements in the Gold Medal c The sire in all classes is to be s on conformation, with the Medal class requiring a higher than the other two. In debating question ancestry of individuals, number of daughters included, general conditions at this time c the indefinite action on the repor

ck of Phosphorus Prob- le Cause of Mysterious Cow Disease

at a phosphorus deficiency has ably been the cause of a mys- is disease known as "Pica" dairy cattle have been suffer- or ten years in Door County, eastern Wisconsin, is the find- f Investigators E. B. Hart, B. A. n, E. J. Delwiche, and E. G. Bai- ley, and recently reported by the State Experiment Station.

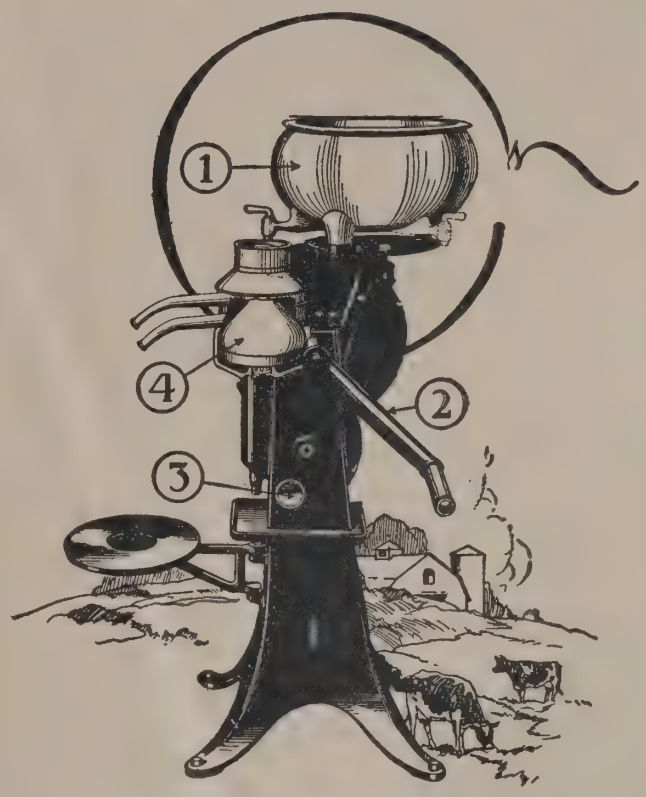
Cows suffering from the disease show extreme emaciation, are stiff in the hind quarters and at times in the front quarters, have swollen joints, harsh coats, dull eyes, and perverted appetites. Legs and ribs are easily broken and the animals chew raw bones with eagerness. The milk flow is considerably decreased.

This disease has been observed in other countries and states, noticeably in Africa, Australia, and New Zealand, Norway, Germany, Montana, and Minnesota. In localities where the disease has been noticed analysis of hays grown in that region show them to be deficient in phosphorus content.

The Wisconsin investigators took six sick cows, divided them into two lots and fed them rations liberal in phosphorus. The first lot received a ration consisting of corn silage, alfalfa hay, a grain mixture of 35 lbs. each of yellow corn and ground oats, 25 lbs. wheat bran, and 25 lbs. oil meal. Salt was also fed. One of this group received one-fourth pound of cod liver oil daily to make sure there was plenty of vitamin D present to enable her to use the phosphorus and lime in the feed.

Ration number two consisted of mixed hay and corn silage and the grain mixture was made up of 45 lbs. ground oats, 50 lbs. ground corn, and 5 lbs. steam bone meal plus common salt. One of the cows on this ration also received in addition one-fourth pound cod liver oil daily.

The test lasted three months. The improvement in all the animals was remarkable. Every one of them gained over 200 lbs. and one of them gained 322 lbs. The stiffness disappeared, the hides became loose and supple, the coats smooth, and the milk production increased 50 per cent. The addition of cod liver oil did not appear to improve the ration and both rations appeared to be equally effective.



The test emphasized the fact that the health of the herd can be protected by feeding concentrates rich in phosphorus such as bran, wheat middlings, linseed meal, or cottonseed meal.

New 1927 SERIES DeLaval Separators

"Easier Turning"

These new De Lavals are the easiest starting and turning separators ever made. Try one and you will agree they are.

Try one of these new De Lavals side-by-side with your old separator or any other machine. You will agree the De Laval is superior in every way. Trade allowances made on old separators. Sold on such easy terms they pay for themselves.

The De Laval Separator Co.

NEW YORK 165 Broadway
CHICAGO 600 Jackson Blvd.
SAN FRANCISCO, 61 Beale Street

Cream separator users who have seen and tried these new De Lavals pronounce them the "best yet." They are without doubt the cleanest skimming, easiest running and most convenient separators ever made.

Other new features are:

1. Turnable Supply Can: The supply can may be turned so that tinware and bowl may be put in place or removed without lifting the supply can from its position on the separator. Every user will like this feature.

3. Oil Window: The new oil window enables you to see at all times the level and condition of the oil. It shows at a glance whether or not the separator is being properly oiled.

4. Floating Bowl: All new De Lavals have the wonderful "floating bowl" now used in De Laval Separators with such splendid results. It is self-balancing, runs smoothly without vibration, with the least power and wear, skims cleaner and delivers a richer, smoother cream.

See and try the new De Laval

A Compact Unit

for Washing and Sterilizing Bottles

A Real Time and Labor Saver

BUILD up the reputation of your product by delivering only in bottles which have been washed and sterilized in your own dairy. It pays.

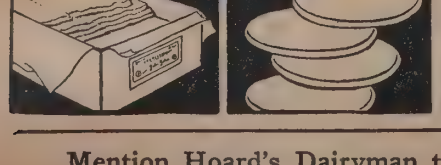
And do it with the No. 9 Fort Atkinson Washer and Sterilizer shown above. Everything is handy. Without moving a step the operator stands at the machine and cleans 500 bottles or more per hour. Only one handling of each bottle. Rinsing and sterilizing practically automatic.

This is just one of the many *CP* aids to profitable dairying. We specialize in milk house equipment. Write headquarters about your problems. 320-page catalogue FREE.

THE CREAMERY PACKAGE MFG. COMPANY
1245 W. Washington Blvd., CHICAGO, ILL.

Milk gathers *Dirt*

between the cow and the pail



EXPERTS say that hairs, flying bits of dirt, and microscopic particles that enter the milk stream between the cow and the pail are an important source of high bacteria count. Put Johnson's Filter Cloth over your pail —*and keep out this dirt!* Catch still more of these dirt particles by filtering through Johnson's Filter Cloth whenever you transfer your milk. And use Johnson's Discs when you strain the milk into your shipping cans.

You'll have cleaner milk. And clean milk *pays!* Ask your dealer for these Johnson aids. Or mail coupon.

The Portable HINMAN MILKERS

The Hinman Gas Engine Milker & The Hinman Electric Milker

Here are two machines you ought to know more about!

Complete milkers—power and all—ready to go to work for you the minute they arrive.

So light and compact, you can easily lift either machine—roll them anywhere—turn in narrow spaces. And you ought to see them do that milking job!

Power? Hardly anything. Cleaning? These are milkers you can *keep* clean—with ease. Dependable? *Valve chamber guaranteed for life of machine.* These are *Hinman* milkers—the machines that have helped dairymen earn better profits for *19 years straight!*

The High or Low Producer Overfed

HOARD'S DAIRYMAN:—The 515 cows tested in the Centerville Association of Wisconsin produced in April an average of 576 lbs. milk and 24.4 lbs. fat. Because of feed shortages, April apparently is one of the hardest months of the year to make the cows produce.

The criticism being made that high cows and high herds are being fed concentrates in quantities that are excessive and uneconomical are not justified. These cows have been fed according to production as far as good judgment would permit. In reality the low producing herds in this association consumed more concentrates per unit of production than the high herds. Herds averaging under 20 lbs. of fat per cow consumed about 10 lbs. of concentrates per pound of fat; those between 20 and 30 lbs. of fat consumed about 9.2 lbs. concentrates, while herds over 30 lbs. of fat consumed only about 8 lbs. of concentrates. While these figures may seem a little high, it should be remembered that they are figured on the basis of the herd rather than the individual cow. A net return of $3.36 per cow was made on herds under 20 lbs. of fat, while herds between 20 and 30 lbs. fat returned $6.72, and herds over 30 lbs. returned $10.01 per cow above feed cost.

Only with low production do feed costs eat up profits; consequently this is the only class that is overfed. Select cows that can make a large return over feed cost.

The figures have been based on Centerville records made during the winter months when the cows were on full feed. While they may lack experimental accuracy, I believe they show the facts in their true relationship. HARVEY L. BECKER, Tester.

Fewer Cows—More Profit

HOARD'S DAIRYMAN:—More profit from fewer cows is the result of improvements made by Clyde Brewer of the Richland Association of Wisconsin. During the first five months of the present year his 15 cows made $141.50 more profit over cost of feed than his 18 cows did during the five months of the previous yea

The 18 cows in Mr. Brewer's last year produced 2,331 lbs. fa first five months at a feed co $690. During the first five m of this year his herd of 15 cows duced 2,580 lbs. fat at a feed co $673. With three less cows i herd he secured 249 lbs. more fa his total feed cost was $17 less. butterfat at 50 cents a poun profit over feed cost was $1 greater the first five months o year, and he had less labor an pense because there were thre cows to care for.

Wisconsin. PETER NELS

Relation of Cream Laye Test

HOARD'S DAIRYMAN:—I have several trials the past two mon find out whether there was any tionship between the depth of e that rises on milk through stan and the test of the same mi placed the fresh milk in the ru Babcock test bottle and measur height of cream that rose t scale for the per cent of fat tat on the neck of the bottle. Th instead of measuring the numb inches of cream I took the me ment in per cent as though the were fat.

These trials indicated tha height of the cream does not ec sarily indicate any relationship test of the milk. I took two sam from the milk of one cow. Or kept out of doors where it wa c and the other was placed on ash in the kitchen. The cream on th fi showed a measured height of 8 the butterfat scale, while the kch sample of the same milk showed measured height of 5. Both sam were thoroughly mixed and o t showed the same per cent of f per cent.

In several cases the milk sh the highest cream layer would sh the lowest test. Milk from ow testing 3.5 per cent showed a re layer of 1.4 at one time. Th n time her test was 3.4 per cen the cream layer was up to 2. sample from Cow B showed a re layer of 2.1 with a test of 3

while a sample from Cow C
d a cream layer of 1.8 and a
f 3.3 per cent. The next time
C showed a cream layer of 2.8
test of 3 per cent.
ese figures show that no re-
can be placed on the height
e cream layer in measuring the
fat in milk. The Babcock test
only safe means of determining
uality of milk.

WILH. BODEKER, Tester.

of That Testing Pays

RD'S DAIRYMAN:—A dairyman
e a member of the Loudoun
y, Virginia, C. T. A. No. 2 last
ry, after much time and
ht was spent wondering if it
or a worthwhile cause. After
eting the fifth month's test he
"If I had known what I do now
ld have been a cow testing as-
ion member ever since I have
in the dairy business."
s herd consisted of 18 cows the
month, producing an average of
lbs. fat per cow and a total net
for the herd of $127.94. Some
ese cows appeared to be board-
ut it would have been unfair to
e of them without a fair trial,
cows were being fed alike.
e second month the feed was in-
d for most of these cows and
esult was a slight increase in
ction with one fresh cow. But
et profit was less than the first
n. It then seemed advisable to
e of these suspicious boarders.
ows were sold as unprofitable
wo new ones were purchased,
g a total of 14 cows in the
The ration was changed and
verage production per cow was
ised to 24.6 lbs. fat against 18.7
wo months previous. The aver-
et profit for the herd was $163
ared with $128 in January. The
made on this herd above feed
has been of marked improve-
each of the five months since
rst of the year. The month of
with only 13 cows in the herd
et profit was more than double
rst with a total of 18 cows in
rd.
s dairyman is now a booster of

Summer Feed

RD'S DAIRYMAN:—As the sum-
coming on dairymen are think-
their summer feed. Consider-
lfalfa was winter-killed by the
ce covering. The alfalfa that
d to stand the ice best was that
d by a topdressing of manure.
overing held the ice up and al-
more air space for the plants.
ctically all of the members are
ng on feeding grain with pas-
his summer. The older mem-
ave had its value demonstrat-
them before and the first year
ers are progressive enough to
p the better practices with
little urging. Watching the
ss of the older members is an
ive to higher ideals and prog-
r the newer.
se who have tried it realize that
er grain feeding will amply pay them for all their trouble. Not only will they profit by it this summer over and above the cost of the grain, but their cows will go into the winter in much better condition to continue to produce well all winter. Thus the returns will be double for a little extra care this summer. This ration should be made up of grains high in carbohydrates and fat this spring and gradually increased in protein as the pasture gets poorer and drier in July and August. A ration made up of four parts by weight of corn meal or barley, three parts oats, and one each of bran, cottonseed, and corn gluten feed meets the early pasture requirements very nicely.

Those who have doubts as to the returns from summer grain feeding have only to try it a year and see for themselves.

CLARENCE PRENTICE, Tester.

*Best rules followed.

Why Join?

James C. McCormick, tester for the O'Brien County Association of Iowa, gives in his annual report the following reasons for joining a cow testing association:

1. The association is made up of wide-awake constructive breeders of dairy cattle.
2. Guesswork is eliminated.
3. Better care is taken of the cows.
4. Unprofitable cows are culled out.
5. It is the only way to build up a herd.
6. The calves and cows are worth more to a buyer.
7. How many successful business men do not keep books? Isn't dairying a business? Why milk for the exercise? Know whether there is profit or not.
8. The cost of the association is very small and is not above the means of any dairyman.

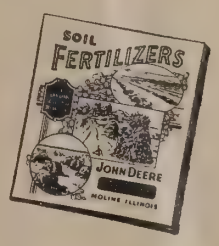
Combines Everything You Want in a Three Beater Spreader

In this New John Deere Spreader you can now get that combination of advantages you have always wanted in a three beater, wide-spread machine.

Easier loading, lighter pulling, better work and longer life—all of these things, so essential to greatest satisfaction and profit from your investment, are combined in the New John Deere.

Its low easy loading box reduces the labor in loading from 15 to 25%. You can load 115 to 125 loads on this new spreader with less work than that required to load 100 loads on the ordinary machine.

Users say that the New John Deere is the lightest draft spreader built. Many of them who previously used three and four horses on other spreaders are using only two on this new machine. Higher drive wheels, roller bearings and fewer moving parts make possible this money-saving feature.



Good work follows the large diameter, low-to-the ground beaters. Manure is evenly spread in a well defined line, beyond the drive wheels before side winds can cause drifting.

John Deere quality construction—fewer parts and all of them made of high grade materials by good workmen—that's your assurance of years of satisfactory service.

Remember, two exclusive features on the New John Deere, the beater on the axle and the box-roll turn make possible this combination of advantages you are sure to want in your spreader.

See this new and better three-beater spreader on display at your John Deere dealer's. Put this money maker to work for you now.

If you prefer the single beater type of spreader be sure to see the John Deere Spreader, the spreader with the beater on the axle. There are more John Deeres on farms in agricultural sections than any other make. It gives you everything you want in an endless apron machine.

Here's a Valuable Booklet on Manures and Fertilizers—Free

"SOIL FERTILIZERS"—A 36 page booklet crammed full of valuable information on the most effective use of barnyard manure and other fertilizers will be sent you free together with folder describing the New John Deere Spreader. Write to John Deere, Moline, Illinois, and ask for booklets T-214.

Ven me und heem togeder vork
Und boat co-operate.

Minnesota. ERNEST F. SAUER.

Tufts Elected President at National Ayrshire Meeting

AYRSHIRE followers gathered at the Hotel Kimball, Springfield, Mass., June 8 for their 52nd annual meeting. The business session was quite brief, due to the thoroughness and completeness of the plans for the business at hand.

A list of amendments designed to place the existing rules and by-laws in a more legal form were carefully discussed, then adopted. They dealt largely with minor details of memberships, registrations, date of sale and delivery fees, etc.

LEONARD TUFTS, NEW PRESIDENT OF AYRSHIRE BREEDERS' ASSOCIATION

President Tufts is an ardent breeder of Ayrshires. He has studied Ayrshire breeding problems for over twenty years and much may be expected of him. Mr. Tufts has bred and raised champion bird dogs as well as champion Ayrshires.

The matter of the Ayrshire Bull Futurity was finally accepted. Six hundred dollars cash prize money will be annually devoted to this class at the Eastern States Exposition. Breeders may nominate any registered Ayrshire cow that has an Advanced Registry, Roll of Honor, or herd test record equal to 10,000 lbs. milk, 400 lbs. butterfat for a mature cow. (The requirements are graded down to 6,400 lbs. milk and 256 lbs. butterfat for junior two-year-olds.) All nominations must be made to Ayrshire headquarters Brandon, Vt., prior to August 1, 1927, for the 1928 show and accompanied by a fee of $2.00.

The date of service and name of sire to which cow is bred must also be furnished.

All bull calves dropped on or after August 1, 1927, from dams that have been nominated are eligible for the 1928 Futurity, providing they are properly registered in the Herd Record of the Ayrshire Breeders' Association, and another fee of $3.00 paid prior to January 1, 1928. Nominating fees paid for cows that subsequently drop heifer calves will be applied as second payments to bull calves that are eligible for the Futurity, or in the event that no bull calves are dropped by nominated cows belonging to that particular breeder the fee will be returned. The third and final payment of $5.00 must be made prior to August 1, 1928.

Considerable interest was shown in this new eastern class during the annual meeting. At least twenty nominations are expected by August 1, 1927. If twenty or more are nominated, the first prize will amount to $120. Fourteen places will receive cash awards. The main idea back of the class is to give more emphasis to Ayrshire bulls about one year of age. This is the popular marketing age and consequently commercial interest is also centered on this new class.

The Ayrshire breed has had a herd test in operation since January 1, 1926. The results have far surpassed the expectation of those who fostered the plan and an enormous amount of general breed development is expected as the test progresses. Seventy herds have been on test at one time totalling over 2,500 animals. At the present time 2,350 Ayrshires are being tested in various classes, making the largest number on test of any breed. Valuable information is being constantly secured regarding various sires and females, also statistics on certain blood lines and families which will have much effect on future breeding operations. The vision of the Ayrshire breed in adopting the Herd Test is certainly very commendable and the success of the plan stamps it as extremely worthy of more general attention.

Breed business increased throughout the various departments du the past year. The gross incom the Brandon office amounted $40,687.38. Six thousand nine h dred one animals were transferre new owners, 1,568 being females 5,333 males; 7,862 animals v registered, an increase of 159 1925. For the fifth consecutive a profit was shown at the end of regular twelve months' period.

The following officers were re-el ed unanimously to serve during next year: President, Leonard T North Carolina; Vice-preside Hugh J. Chisholm, New York; A. Seitz, Wisconsin; Percival Rob Pennsylvania; Dr. Jno. A. N Maine. Directors for three years D. Karr, New York; R. M. Gore, diana; Dr. E. C. Deubler, Penn vania; C. W. Wilson, Vermont; Henry Higginson, Massachuse David G. Page, Kansas; Gilbert Millan, Quebec; C. H. Bartlett, York.

The photograph of the Ayrs cow worked out by Cochrane Tryon was pleasantly discussed preliminary plans laid for the ph graph of the ideal Ayrshire bull.

The meeting adjourned at and shortly after eating all pre journeyed to Alta Crest Farms. a very enjoyable and educational ternoon was spent as guests of and Mrs. Sagendorph. Alta produces certified milk on a l scale and also does considerable work as well as showing, all of w added to the interest. In the eve the annual banquet took place. C. W. Larson, chief of Bureau Dairy Industry, gave a very inte ing talk on the magnitude and pre scale of the dairy industry. He gave those present a clean-cut of the future for dairying.

John J. Morgan, Morgan Ad tising Agency, Boston, talked "Bulls—How to Sell Them." Hi marks were very interesting an explained some of the fundam points of selling that every bre can and should employ. C. W. son presided at the banquet.

Between the addresses Secre Conklin and Superintendent of vanced Registry Kyle distributed silver plate and medal awards by various breeders throughout

Annual Ayrshire Sale Averages $240

On June 9, the day after the annual meeting, Ayrshire breeders gathered in the coliseum of the Eastern States Exposition for their annual sale. This year it was held under the auspices of the Ayrshire cattle breeders of New England and W. E. Brigham was sale manager. Fifty-eight animals of various ages were sold by Auctioneers Granger and Watson for what was considered very fair prices. No outstanding average was expected but buyers were confident of a profitable return on their individual investment.

Pineholm Farm, Massachusetts, consigned the top animal, Butter Girl's Valley Fair Kilbowie, a seven-year-old daughter of Weymouth Robin Hood 4th. Strathglass Farm paid $500 for her.

Robin Hood's Elowine from the same herd went to Sycamore Farms, Pennsylvania, for $475. Edgerstoune's Captain, a three-year-old bull sired by Hobsland Ayr Pilot and out of Auchenbrain Miss Craig 7th, champion head and horns cow at Boston Ayrshire Show, brought $310. He was consigned by Edgerstoune Farm, New Hampshire, and purchased by M. H. Benson of the same state. It was a popular opinion that this bull could have brought more money and still been below his real value.

Fifty-eight animals were sold during the afternoon for a total of $13,940.

Next year the Ayrshire Breeders' Association intends to conduct the annual sale. Complete co-operation of all breeders is of course necessary if the event is to be considered as national. Present plans are to select the animals very carefully so that buyers may make plans to attend an outstanding Ayrshire event.

The animals selling for $250 and over and their buyers are:

Fairlea Farms Co., Connecticut	
Berlin Bess 3rd	$380
Mrs. Alice H. Fox, Rhode Island	
Middlesex Elizabeth	$250
Marguerite of Solitary Acres	255
Mondamin Farms, New Hampshire	
Middlesex Bloodroot	$325

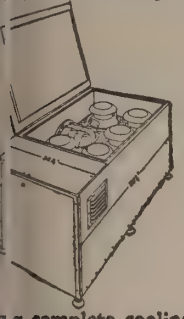
An Announcement That Revolutionizes Milk Handling Methods



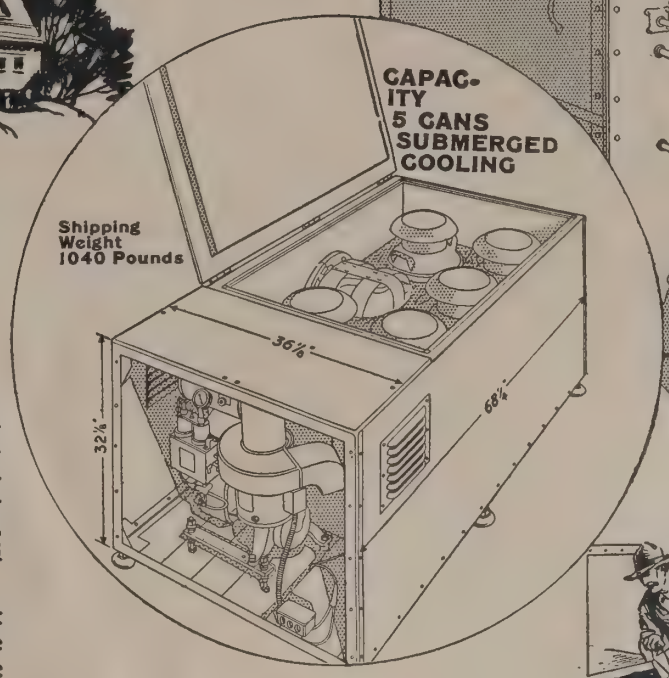
Definite Economies~ More Profits~ Less Labor~

ry dairy farmer in the country will this message of intense interest. ething new. Something modern. ething better. Displacing old-fash-d, laborious methods. Saving time, r, money, worry, and insuring a full rn for your milk.

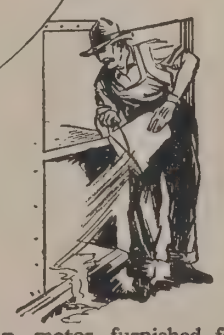
efficient, economical, sanitary milk ing method at last. Practical for the time. Nizer-Kelvinator Electric Coolers.

can do away with expensive, troublesome ice esting. No more worry about the weather or ice supplies. No more slow cooling.

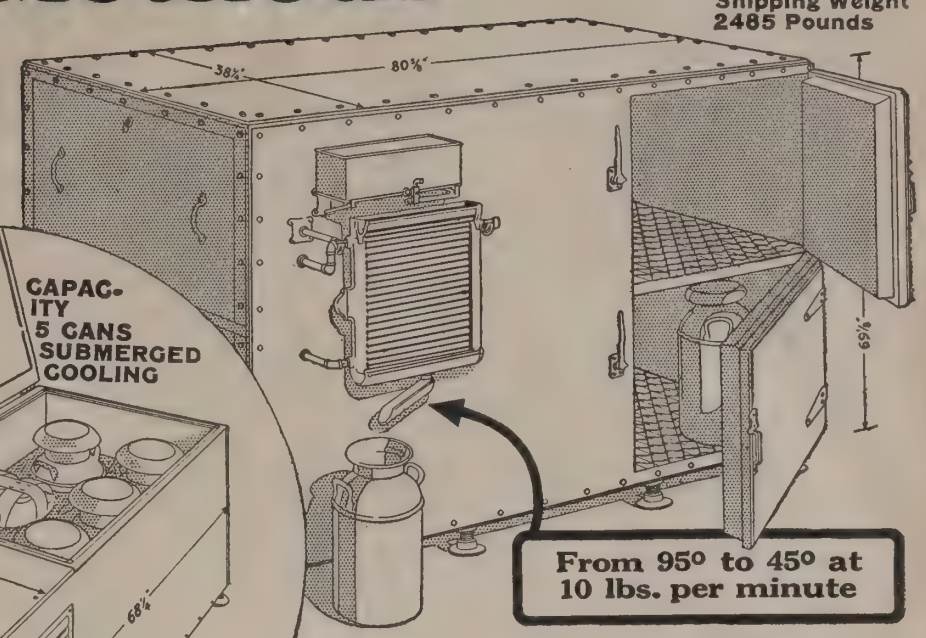
2 Sizes—2 Types for Large and Small Herds



Nizer-Kelvinator Electric Milk Coolers are made in two sizes, the larger of which will take care of the output of a 16-can dairy. There is a storage space for eight 10-gallon cans of the night's milking and the morning milk can be quickly cooled over the aerator from 95° to below 50° F. It has a 16-tube 18-inch return tubular aerator, al-



g complete cooling by brine. Making you entirely endent of water supply. Or, if plenty of water is able, the milk may be precooled at a saving of from to 60% in operating cost. Either way, operation is isingly easy, and you can quickly cool the milk.



smaller cooler is of the submersion type and will ac-nodate five 10-gallon cans. Like the larger, it is com-ly self-contained. Ready to set up and start working ou. Reliable and fool-proof.

Lowest Possible Operating Cost

Nizer Compressors have proved their efficiency for in ice cream cooling installations. Model I, used with arger cooler, has a $^4/_{10}$-h. p. Universal Motor run by volt A. C. or D. C. It has ½-ton ice melting capacity and, on a 5¢ K. W. hour rate, produces cold equivalent to 100 lbs. of ice at a cost of only 10½¢. Model A Compressor, used with the smaller cooler, has ¼-ton ice melting capacity and operates on a ¼-h. p. motor, furnished for 110-volt A. C. or D. C. or for a 32-volt farm lighting system.

Last a Lifetime

Nizer-Kelvinator Coolers are ruggedly built—to stand the wear of farm use for years. Heavy steel housing, protected by steel bands and lined with galvanized iron. Shelves and flooring of the larger cooler are of heavy subway grating, removable for cleaning. And it is on adjustable standards for cleaning underneath. Storage compartments can easily be flushed out with water.

Tested on Real Dairy Farm

Nizer-Kelvinator Dairy Coolers have been under the most rigid dairy farm tests. Not an experiment—not a half-baked idea brought out in a hurry. But thoroughly tested. Proved practical, economical and efficient.

Best Farmer Selling Arrangement

Nizer-Kelvinator has arranged to sell to and through milk dealers and most Kelvinator dealers in the United States and Canada. Ask your dealer about it at once. He will explain how easily you can have the advantage of this modern cooling method. Or, if you prefer, write direct to the nearest Nizer branch for a descriptive folder.

$500.00 free for a name

Nizer-Kelvinator wants a good single-word name for its new Electric Milk Coolers—a name that means something practical, efficient, economical—a real dairy farm name.

Anyone connected with dairy farming may compete, by merely filling in the coupon below. The First Prize for the winning name is $500.00 in gold.

Beautiful Kelvinator for Second Prize

Nizer is combined with Kelvinator as a part of Electric Refrigeration Corporation, which makes it possible to offer as second prize—the celebrated "Sealtite" Cabinet Kelvinator Model 272. The oldest domestic electric refrigeration. In a beautiful gray cabinet—steel-clad, white enamel lined, two inches corkboard insulation. Ample storage space, light and easy to move about. The ideal electric refrigeration—giving "cold that keeps" without attention. Worth $210.00.

This Folder Will Help You

Learn all you can about Nizer-Kelvinator Electric Milk Coolers. Send for a descriptive folder. Then get up a good descriptive name. This is a fair, square contest. The judges are Harry A. Sieck, General Salesmanager of Nizer and Vice-President of Kelvinator, Inc.; W. A. Schreyer, Business Manager of Dairymen's League News; W. C. D'Arcy, President, D'Arcy Advertising Company, and Gordon Muir, Advertising Manager of Nizer.

Send in as many names as you wish—but each must be on a separate sheet of paper—and they must all be in the offices of Nizer Division, Electric Refrigeration Corporation, Detroit, Michigan, by noon Wednesday, Aug. 15th. The names of the winners will be published in this publication by Sept. 15th.

EDITORIAL COMMENT

THE TUBERCULIN TEST

At the annual summer meeting of the Wisconsin State Guernsey Breeders' Association, a resolution was unanimously passed expressing confidence in the tuberculin test as an accurate diagnostic agent and commending the tuberculosis eradication program that has been instituted by the Wisconsin Department of Agriculture.

This group of Guernsey breeders fully appreciates that tuberculosis is a costly disease and that it should be eradicated. They look with disfavor upon the few who would discontinue this good work and who are engaged in trying to create a suspicion as to the accuracy and reliability of tuberculin in locating animals suffering from tuberculosis.

The work of eradicating tuberculosis in Wisconsin is being well done. No thinking dairy farmers or breeders desire any interference with this program for they know that if we can free all herds of tuberculosis, their animals will be more valuable and in greater demand. This means better herds, a larger consumption of dairy products, and a more profitable industry.

BUTTER THIEVES

Late in April thieves broke into the Bloomington, Wis., Co-operative Creamery Company and stole eighteen tubs of butter valued at $600. Other instances have been reported by creameries sustaining similar losses. Good roads and trucks have made it possible for thieves to operate on a different system than in the days when stealing horses was so common. We have not heard of a horse being stolen in years because it is practically impossible for a thief to escape with a horse.

No plan has ever been worked out to stop all stealing. Through organization and the adoption of burglar alarms it can be minimized. The time may come, through electrical devices and improved methods of fastening doors, when the thief will be defeated. In the meantime, the simplest way to keep butter from being stolen is to have some one sleep at the creamery. We believe the situation is such as to warrant creamery manufacturing companies to devote attention to the development of a refrigerator which would require some hours' work to open. There can also be added protection by the installation of a burglar alarm.

GRADES—PURE-BREDS

Grade dairy cows are selling at relatively higher prices than pure-breds. This and other things have caused this statement to be made, by those who are not careful reasoners, that grades are better than pure-breds. It requires but a moment's reflection to reveal that grades are wholly responsible to pure-breds for their superiority over natives or scrubs. That some grades will produce more than some pure-breds is true, but to hold that all grades are superior to pure-breds is to overlook the source of grade blood.

The good prices which the well selected grades bring should challenge the attention of all pure-bred breeders and lead them to inquire why they sell for relatively higher prices than pure-breds. The answer is simple. The grade is more carefully selected. There is no reason for keeping an inferior grade, either in production or type. Consequently when a grade cow does not measure up to a certain standard of production she is sold to the butcher. This is particularly true of dairy farmers who belong to a cow testing association and conduct their affairs on a sound business basis. Data reveal that grade cows with good yearly records and of good type are the ones selling at attractive prices.

The pure-bred is responsible for these good grades, but the better selection of the grades points the way for the breeder of pure-breds. The breeder who expects to develop a good herd must make tests upon a yearly basis and eliminate low producers and those of poor type. The demand is for capable cows and of good type. The pure-bred breeders that meet this demand will be the ones to sell their stock at good prices. The stock of such breeders will be superior to the grades and will sell at relatively higher prices.

WHY MORE LAND?

The Reclamation Bureau has devoted itself constantly to opening up new sections of country and so far as we are advised their results on the whole have been most disappointing. According to reports, a survey has been made through the southern part of this country for the purpose of determining ways and means of draining certain sections in order to provide more land for cultivation. The government should direct itself to taking more marginal lands out of cultivation and growing more timber, rather than bringing more land under cultivation. The chief trouble with agriculture today is that we are cultivating too much land.

Millions of acres in this country can well grow a crop of timber before they will be needed to produce other agricultural products. Wisconsin has recently amended its constitution so that land devoted to forestry need not be taxed. The proposed plan is to levy a tax upon the timber when it is cut. It seems to us it is nothing more or less than good sense to give the coming generations an opportunity to bring land under cultivation rather than for the government to go to the expense of reclaiming land for agricultural purposes when we already have more under cultivation than it is profitable to operate.

SELLING FEEDS

If there were two elevators in town, one paying a dollar a bushel for corn and the other two dollars, there is no question what elevator the farmer would sell his corn to.

Cows on the farm which offer a market for feeds, pay various prices for them and many farmers do not seem to be the least bit concerned as to what each pays. Cow testing association records are giving us much information regarding the different returns cows make for their owners. The following table shows what cows will return that produce various quantities of fat:

Lbs. fat per cow	Returns pasture per month	Per ton silage	Per ton hay	Per ton grain
150	$ .92	$2.22	$ 8.32	$21.70
150—200	2.10	5.28	20.34	48.94
300—350	3.27	8.76	33.10	92.42

It will be noted that the cow producing but 150 lbs. of fat paid but $21.70 a ton for grain, while the cow that produced from 300 to 350 lbs. returned $92.42 a ton, more than four times as much as the 150-lb. cow. It should also be noted what these cows of varying abilities paid per month for pasture, per ton for silage and hay. It is then well to ask how much your cows pay per ton for their feed.

A RECORD OF CO-OPERATIVE ACCOMPLISHMENT

The audit of the accounts of the Twin City Milk Producers' Association shows that at the close of 1926 it had assets of something over two million dollars, with liabilities of three quarters of a million dollars, the net worth of the association being one and a quarter million dollars.

It is interesting to note that of the total sales of $5,362,524 for the last eight months of the year, 51 per cent was for whole milk, 26 per cent for sweet cream, 10 per cent for butter, 5 per cent for condensed milk, 3 per cent for cheese, 2 per cent for skimmilk, 2 per cent for powdered milk, and 1 per cent for ice cream. This is the gross ceipt from sales and does not necessarily re sent the net income from these sales. Conden milk represents 5 per cent of the total sales, the expense of this department is greater t any other. This is largely accounted for by expenditure of $61,000 for sugar, or nearly fourth of the total receipts from the sale of densed milk. The association received $9.50 its sweetened condensed milk, finding it a pr able outlet for a portion of its surplus.

The most interesting and instructive item in report is the showing as to the expense of op tion. The association returned to its member per cent of the total amount received from sale of products for this period of eight mon The total cost of operation of the association only seven per cent, and this includes the supp and manufacturing costs for the 49 per cent plus of the total milk received as well as the pense incident to supply the dealers with w milk.

Members of the Twin City Milk Produc Association may well take pride in this record accomplishment. It illustrates the possibility securing efficient management that not only m the local situations as they arise, but that does work at a reasonable cost and without extra gance. The success of a dairy co-operative is entirely measured by the price received for product. Questions of local supply and dem influence price materially. Good manager meets this situation and protects the prod from exploitation, but it is particularly plea when this management is able to operate reasonable cost.

SWEET CLOVER INCREASE YIELDS

If one were to ask the average farmer whe legumes increase or help to maintain the yield succeeding grain crops, the answer would be 'y as many times as the question were asked. If were to ask how much legumes increase yield the answer would be somewhat speculative. If were to ask how much different legumes incr succeeding grain crops the answer would still speculative.

The Ohio Experiment Station reports some perimental trials that throw some light on subject, at least for the particular soil on wh the trials were conducted. For nine years yields from a 3-year rotation of corn, oats, and gumes have been measured on a soil known heavy phase of Brookston clay. In this trial legume crops compared were plowed under year as they came into the rotation. The increase in yields on corn and oats were as follows:

Where medium red clover was grown the age annual increase of four crops of corn was bushels per acre compared to corn grown with a legume in a rotation of corn and oats. Wh sweet clover was grown the increase was 8. bushels per acre; where mammoth clover wa grown the increase was 7.3 bushels per acre.

The influence on the oat yield for medium re clover was 2.6 bushels per acre inerease f crops; for sweet clover the increase was 9 bushels for mammoth clover it was 3.9 bushels.

A similar experiment was tried where th gumes were cut for hay and only the stubblean fall growth plowed under the following sprin for corn. Sweet clover gave an increase of 6.3 bushel of corn and 8.5 bushels of oats above the yield se cured from medium red clover, and 9.4 bushe corn and 7.4 bushels of oats above those se re from mammoth clover.

The outstanding point of interest in this experi ment, and one that dairy farmers ought to ak use of, is the increase from sweet clover. Th in creases from the red and mammoth clover ar very good but those from sweet clover are grate than many farmers realize.

Savings for Bedding and Fertilizer

it advisable to use waste wood products such shavings or sawdust on the land? Will it harm soil? Do they have much value as fertilizer?
ferta, Mich. M. S.

wdust and shavings contain about one-half as h nitrogen as straw and about an equal amount hosphorus and potassium. Ordinarily straw absorb two times its weight of water, while lust and shavings have from two to three s the absorbent power of straw. The plant in the shavings, particularly if they are pine ings, will not become so readily available as that in the straw.

avings are preferred for bedding by producers gh grade milk because of their greater absorb- power and because the cows will keep some- cleaner with a less amount of bedding. Some tion has been registered as to their use be- e they do not always decay readily in the soil. would be no great disadvantage on medium y soil but might prove of some disadvantage ght, sandy soils that are inclined to dry out dly. However, we anticipate this danger in the of shavings is overestimated. Manure is m applied in such quantity as to make the ning effect of the shavings a very material r in its drying out. Hardwood shavings will y more readily than will pine shavings.

Best Depth to Plow

ease inform me whether it is a good thing to deep. My soils are clayey and quite sandy.
dison, Wis. R. S.

has been abundantly proved that it is not good ow a field the same depth from year to year. lowing shallow or at a uniform depth, the soil ot become mixed well and a hard bed is formed e bottom of the furrow, which neither the air, r, nor the roots of plants will penetrate readi- A little subsoil turned to the surface occasion- allows the elements to act upon it freely, thus ating food as it mingles with the surface soil vegetable matter. In this way more valuable food and greater depth of soil are furnished plants which grow upon it.

e quite frequently observes soils containing plastic clay. In times of rain, the clay from urface of these soils is washed away either in- reams or it percolates through the soil and is ited into the subsoil below. It happens in this a usually that subsoils contain more finely divid- ay than do the loam which overlay them. Clay to retain moisture.

is also true that these clayey soils appear dry e surface at the same time when the subsoil is aps too moist for affording best condition for ing. Plowing under such conditions may form er of puddled clay as it slips across the wet il and in so doing brings about a very unde- le condition of the plowed soil.

r deep, rich soil, deep plowing, say from six to inches, is best in the fall of the year. The should be increased by one-half inch each eding year until the required depth is ed. Then return to the normal by gradually ishing the depth from year to year. Light ing soils, those running into sandy loam and it is safer to plow shallower. For thin, clayey and equally light subsoil, plow from five to inches; for small grains it is perhaps better very deep plowing, because it does not turn ompact clay to the surface and it loosens the o a good depth. Of course, where root crops intended to be raised, it is profitable to oc- nally subsoil and plow deeper. Some farmers ice plowing a little deeper each year for sev- years in succession and then for one season at about half the depth of the deepest plow- n a series of years.

Food Value of Milk

ease give the relative food value of milk as ared with other foods.
nesville, Wis. A. R. C.

quart of milk contains as much protein as 7 es of sirloin steak, 6 ounces of round steak, eggs, and 8.6 ounces of poultry. In energy a quart of milk is equal to 11 ounces of sir- steak, 12 ounces of round steak, 8.5 eggs, 10.5 ounces of poultry.

an economical source of protein, sirloin would have to sell at 23.3 cents a pound and at 25.1 cents a dozen, when milk can be pur- d at 10 cents a quart. With milk selling at ents a quart, sirloin steak should sell for 35 a pound and eggs at 38 cents a dozen to l milk as a source of protein.

As an economical source of energy and heat building, sirloin steak should sell for 14 cents a pound and eggs at 13 cents a dozen to equal one quart of milk at 10 cents. If milk sells for fifteen cents, the consumer can afford to pay 21 cents a pound for sirloin steak and 20 cents a dozen for eggs to secure the same amount of energy he will get in the quart of milk.

Comparison is made here on the basis of animal products only as they are more nearly the chief competitors of milk on the family table. If the vegetable and grain products were considered, the comparative protein and energy value of milk would not be so favorable. But, even so, the whole story of milk has only been partially told, for milk is more than protein and energy. Milk is a fundamental food for all mankind.

Milk contains something special in it that is essential to growth. Scientists call it vitamin A, and milk and milk products are the best and cheapest source in the human food supply that is available for this essential.

Milk proteins are complete proteins such as is found in no other food. They are nicely balanced to the body's need and are nearly all digestible.

Milk contains lime, and the diet of the ordinary person is more often deficient in this than in any other chemical constituent. A quart of milk contains a quarter of an ounce of mineral matter, of which lime and phosphates constitute one-half. These materials are in such a form as to be most readily assimilated. Lime and phosphate build good bones and good teeth, and milk is much richer in these than other common foods and is one of the cheapest sources of this essential but often neglected food constituent.

Making Alfalfa Hay

In handling alfalfa hay do you stack it the day after it is cut or do you bunch it after raking? Do weeds amongst it affect the curing of second and third cuttings? How many turnings do you find the windrows require in good haymaking weather and does the side delivery rake shake off much more leaf than a tip rake.

It may interest you to know that herd testing is being subsidized by our federal government as well as by the state government of Victoria. There is now every inducement to progressive farmers to have their cows tested as half the cost of testing is borne by the government.
Yinnar, Australia. M. F. W.

The condition of the weather makes a great deal of difference in the handling of hay. In good, dry weather it is our practice to cut the hay in the forenoon, rake it up with a side delivery rake in the afternoon, and if the weather continues good we quite occasionally haul it to the barn the succeeding afternoon. It is well to go over the windrows some two hours before hauling so as to turn the bottom up to the drying action of the wind and sun.

The use of the windrow hay loader expedites the operation, although it is not difficult pitching the hay on to the load from the windrow. Where there is assurance of good weather it might be well in most cases to allow the hay to stand in the windrow for two days. If rain intervenes it is remarkable how quickly the hay in the windrow will dry out, particularly if it is merely rolled over with the rake after the top part has dried out.

The weeds will dry out quite as well as will the alfalfa, at least we have observed no trouble from this. Quite occasionally the hay will get very hot in the mow and will turn a dark brown in color. This is no disadvantage as the cows really like the dark colored hay the best; that is, hay that has heated in the mow and through the fermentation process acquires a somewhat sweeter flavor. Some men are fearful of spontaneous combustion and there is possibly some danger of putting alfalfa hay in the barn in this condition. However, we have followed this practice for a number of years and have had no difficulty, possibly due to the fact that we attempt to distribute the hay evenly over the mow so that it will pack down solidly.

A side delivery rake will not shatter the leaves as much as the dump rake. Its general tendency is to turn the leaves into the inside of the windrow so that they cure out somewhat more slowly and so do not shatter as badly as when raked up with the other type of rake.

We were glad to learn of the splendid support that is being given to cow testing associations by the government of Australia. We are inclined to believe that this is one of the most important things that the government can do for the advancement of the interests of the dairy farmer. It is a practical, every day sort of thing that does the work of building dairy farm profits.

Compensation of Farm Manager

I am a subscriber to your valuable paper and I am writing to get your views as to what is a fair wage to pay a man for running a farm, he to do all the work with the aid of his family. Not less than twenty-five cows will be milked the year round, and the expectation is to raise about eighty-five hogs a year and keep about 200 chickens.

In addition to a straight wage per month the farmer is expecting a share of the profits. Should this be based on gross or net, and what proportion? He is to furnish nothing in the way of stock or equipment. Farm consists of about 160 acres, divided into about one-half plow land and one-half bluegrass pasture. The farmer has had considerable experience in farming in the past, but failed during the deflation and has been doing common labor and wants to get a fresh start.
WISCONSIN OWNER.

Wages are so much influenced by local conditions and the ability of the worker that it is impractical to make any definite statement. It is probable that such a man as you have in mind should receive a wage of not less than $60.00 to $75.00 a month, and in addition house rent, garden, milk, eggs, and if hogs are raised, a certain amount of meat each year. It is probable that as a farm manager he should receive even more than this, particularly if he is to supply all labor that is done on this farm. Such a farm as you have would require, normally, not less than the full time of two men. If all work is to be done by family labor, your manager should receive not less than double the wage of the usual farm laborer in your vicinity plus a certain allowance as manager of the farm.

The suggestion has been made that a man employed as working manager should receive a definite monthly salary of something in excess of the wages paid to regular farm help in the vicinity. In addition to his salary and the usual perquisites of garden, milk, etc., he should receive, say, 25 per cent of the difference between the receipts and expenses of the farm. Under this arrangement the owner should supply all the capital for the running of the farm and the manager has no other responsibility except to see that the work is well done, the books kept, and the interests of the owner protected at all times.

Professor Boss of Minnesota some years ago suggested the following agreement as being suitable for the conditions as outlined:

"This agreement is for the term of one year, beginning ———— with the option of renewal for two years additional, or so long as may be mutually agreeable.

"The Farm: The farm to be operated is known as ————, described and located as follows: ———— and owned by————. The general type of farming to be followed is dairying and mixed crop raising.

"Manager's Salary: Mr. ————, as working manager, and his wife, as housekeeper, are to be paid a joint cash salary of $55 a month and board. In addition to the salary of $55 a month, they are to receive, at the end of the year, 25 per cent of the difference between the receipts and the expenses. In determining the difference any increase in inventory is to be counted as a receipt. A decrease in inventory is to be counted as an expense. Land and personal taxes and insurance are to be considered as an expense. Permanent improvements in the way of new fences, buildings, tiling, ditching, or alterations and repairs requiring material or additional labor beyond two per cent per year of the inventory value of the buildings and fences, are to be charged to the capital account of the owner.

"Financial Management: The farm is to be operated on a budget system providing for a certain amount of money from which to operate the farm during the year. The budget allowance is to be supplied by the owner until it can be provided from the receipts of the farm. All receipts shall be paid into the budget by the manager. All expense shall be paid from the budget by the manager upon the approval of the owner. He shall keep the owner fully informed of all financial transactions and shall keep a book account of expenditures and receipts which shall be open at all times to the inspection of the owner. No expenditures involving a sum greater than $50 shall be undertaken without the agreement of the owner and the manager. Each party to the contract shall make it a point to keep the other party fully informed as to the plans and prospects and, so far as possible, shall determine jointly in advance the crops to be raised, the stock to be marketed, and the general policy to be followed in operating the farm and marketing the produce."

Use BOVINOL
REG U.S PAT OFF

and Stop the Unequal Fight

your cows must wage against flies. A cow has only a switching tail for a weapon to keep flies from stinging. Fighting the unequal battle for quiet and comfort, the cow wastes energy—equivalent to the food value of a pound of oats per head per day! Scientists have made that estimate.

What is the result of this waste to farmers and dairymen? Financial losses. During very severe outbreaks of flies, it has been estimated that milk production was reduced by 40 to 60 per cent, while the rate of fattening was reduced almost as much.

Spray your cows with Bovinol and prevent such losses. Flies may settle on a cow that has been sprayed with Bovinol—but they cannot sting! Bovinol is harmless—contains no poisonous elements. It is odorless, tasteless, and stainless.

Apply Bovinol with the compressed air type of sprayer in which the oil is forced out by air pressure and is further atomized by an air blast. Spray against the direction of the hair, so that Bovinol will penetrate the coat, and be sure that every square inch of the hide is covered. It requires less than a minute to spray one cow.

Agricultural experiments and practical dairy tests have shown that a consistent use of Bovinol will increase milk productionat least 10%!

Spray your cows morning and evening with Bovinol.

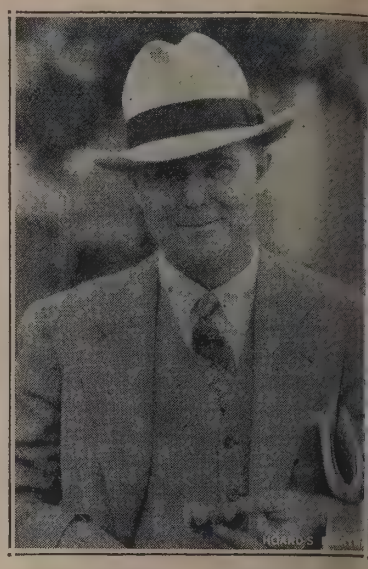
Jerseys at National Bring $45,530

THE national sale idea is what might be termed a new one to Jersey breeders. In past years many sales have been held, some of them annual affairs, which made it a bit difficult to get a national consignment sale started. The spirit with which Jerseymen are taking hold of the matter speaks well for future sales.

To fit its place in Jerseydom a national sale must be outstanding in character. Breeders should feel that it is an honor to own an animal or two that the committee deems acceptable. When this state of affairs is brought about, not only with Jerseys but with all breeds, buyers will purchase with confidence the offerings that pass through the ring.



This year's national sale was held June 3 at the Interstate Fair Ground, Trenton, N. J. In passing it might be appropriate to add that the management of the Trenton Fair takes an active interest in live stock affairs. Its co-operation and many courtesies are sincerely appreciated by the followers of the various dairy cattle breeds.

The animal bringing the most money of the sale was Rower's Belle 3rd, a four-year-old daughter of Cedar's Golden Oxford. She was imported and consigned to this sale by B. H. Bull & Son, Canada. Her price was $3,600 and she went to Dr. W. H. Hutchings, Alabama.

Another Bull consignment, namely Merry Magpie's Girl, a three-year-old daughter of You'll Do's Volunteer, went for second high money when she brought $1,650. This animal was also purchased by Doctor Hutchings' agent, John Lee.

Nine bulls were sold for an average figure of $387. Pebble Hill Plantation paid $850 for Lorraine's Prince, a four-year-old son of Fauvic's Prince and consigned Barnes. J. W. Woodruff, Geor placed the high bid on Wauba Highland Lassie's Forward and this three-year-old son of Forw for $775.

The sale started shortly after

JOE MORRIS, SALE MANAGER A NATIONAL JERSEY SALE

o'clock and quick action was ne sary to sell the entire 85 head du the afternoon. Bidding was q brisk, however, and the details of sale were handled very well by

J. S. CAMPBELL, JR., W. R. SPANN, TOM DEMPSEY AT NATIONAL JERSEY SALE

Manager Morris and Auctior Perry and McCord.

The average price paid for th animals sold was $542.

The animals bringing more $400 and their purchasers are:

American Jersey Cattle Club Meeting

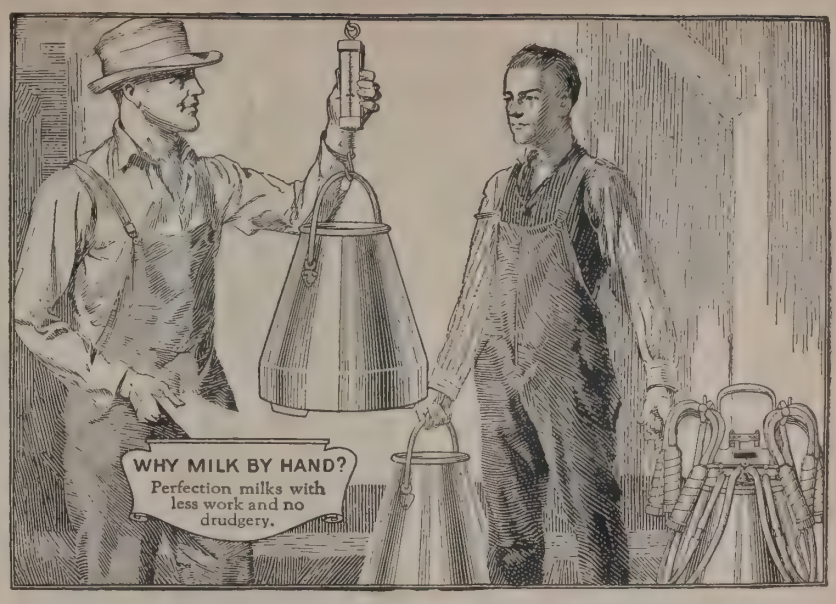
The 59th annual meeting of the American Jersey Cattle Club was held at the Waldorf-Astoria Hotel, New York City, June 1. Lewis W. Morely reported that during the fiscal year ending March 31, 1927, the number of registrations reached 55,904, a new high record for any one year. Transfers of ownership totaled 44,536. Twenty-three bulls and 360 cows were imported from the Island of Jersey last year. The total number of animals registered recently passed the millionth mark, which establishes a new milepost in the history of this breed. The Club membership is now 1,057, forty-four new members having joined last year.

The adoption of the one-day test has undoubtedly been partly responsible for the increase in Register of Merit testing. Three-fourths of all breeders doing testing are using one-day supervision. In March, 1927, 2,380 cows were on test. During the fiscal year 2,147 records were accepted of which 1,095 were for 365 days and 1,052 were for 305-day tests.

The extension work followed much the same plan last year as previously. Nine fieldmen were employed. At present there are 284 organized Jersey calf clubs with 3,417 members, and about 280 communities expect to organize calf clubs. There are 199 Jersey bull associations in the United States.

During 1926—27 the Extension Department took part in six better sire or dairy campaigns and had representatives on five special trains operated by various railroads to stimulate better dairying.

The assistance given in the development of community programs has been one of the features of the Club's field work.



R. M. Gow, the treasurer, submitted a detailed report covering the financial transactions of the Club. The total net receipts for the year were $290,824.50 and the expenses were $13,143.92 over the receipts.

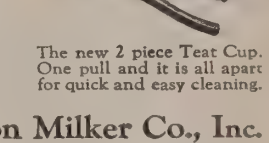
A resolution was passed tendering the profound sympathy of the Jersey breeders to those who suffered from the flood in Louisiana. An appeal was made to Jersey breeders throughout the country to contribute both Jersey cows and heifers to be shipped to tick-free areas, and distributed by the Rehabilitation Committee of Louisiana.

The adoption of a design for a Jersey milk trade-mark was announced. Steps will be taken to familiarize the public with the new design and what it represents.

President Barnes in his address outlined his plan to bring about more uniform judging in the show ring. He and Professor H. H. Kildee of Iowa and C. J. Tucker of Longview Farm, Missouri, have spent much time on this subject, and it is believed that the judges at the larger shows will co-operate with this committee in its effort to secure greater uniformity, with more emphasis laid on capacity and milking qualities as shown by veining, form, and size. The minimum and maximum weights for mature cows and bulls have been increased 100 pounds on the score card, but it is felt the effort to improve capacity, milkiness, and size will not conflict with the smoothness, beauty, and quality of the breed.

Col. A. Victor Barnes of Connecticut was unanimously re-elected president and A. L. Churchill of Oklahoma was elected vice-president. The new directors are: J. S. Campbell, Pennsylvania; Sam F. Crabbe, North Dakota; John S. Ellsworth, Connecticut; J. W. Coppini, California; and J. Riley Green, Texas.

Weighty Reasons Why Perfection Pays



"AFTER five days of milking with the Perfection we had gained a full 8 gallon can of milk"; so writes another satisfied user.

Yet this is the experience, not of one Perfection owner but of thousands.

One needn't tell a Perfection user that cows like its natural uniform action. Cows show their own preference with more milk and a longer lactation period.

The new two piece Perfection teat cup accounts for much of this increased production. It milks cleaner, faster, and with less vacuum; besides it is quick and easy to wash.

The Perfection has still other ways of increasing your profits. It enables you to milk in one-third the time. In a dairy of ordinary size it saves enough in wages alone to pay for itself in less than a year. Now that the Perfection is so easily obtainable, (sold on monthly payments if desired) it is really expensive to milk by hand. Why assume this unnecessary expense? The Perfection is the old reliable milker, backed by fourteen years successful service. Write today for our new catalog.

The new 2 piece Teat Cup. One pull and it is all apart for quick and easy cleaning.

PERFECTION MILKER

"Plant We a Tree"

Now to thy bosom, Mother Earth,
Let us in faith confide
This budding nursling—thine from birth—
Safe in thy care to bide.
Protect it well from drought and dearth,
Rich sustenance provide;
Cause it to wax a tree of worth,
Let no dire harm betide.

We pray that thy fair branches, Tree,
Pointing to Heaven above,
May guide our eyes to look, with thee,
Up to the source of love.
There may we inspiration find,
Whence come sunshine and light;
There courage seek, for heart and mind,
To work for God and right.

—A. S. ALEXANDER.

The senior three-year-old record for Kansas Jerseys is now higher by 230 lbs. of butterfat than it was before the young pure-bred cow, Octavia's Jolly Mabel, completed her test. This cow, which is owned by Everett T. Comp, was placed on test at 3 years and 8 months of age, and in the ensuing 365 days she produced 775.45 lbs. butterfat and 15,653 lbs. milk.—The American Jersey Cattle Club.

A New Sanitary Finger Pull Cap for Milk Bottles

LOW COST

A new sanitary cap that fits tight. Easy to remove from bottle with fingers. The household appeal of Kuvercaps gets new customers and holds the old. Try out a few and see how popular they are. The cost is small—they build new trade quickly. Ask your supply house for samples and prices, or write us. We also make "Midwest" Standard Disc Caps—noted for quality.

for feeding calves

Do you know that you can cut milk costs in half by adopting the "minimum milk method," using dry skim milk? Hundreds of dairymen who sell all their whole milk are making this big saving. They simply mix a pound of dry skim milk with a gallon of water, making a money-saving mixture which young calves thrive on. And they buy a pound of dry skim milk for half or less of what they receive for a gallon of whole milk. (1 gallon whole milk contains 1 pound milk solids.)

AMERICAN DRY MILK INSTITUTE
160 North La Salle Street Room 720-C
CHICAGO, ILLINOIS

FREE Write today for "Better Calves" giving successful feeding methods. State number of calves you feed. We'll tell you where to buy dry skim milk.

Remixed—1 pound dry skim milk to 1 gallon of water —is also good for pigs and poultry. It is splendid also for baking.

A Vest Pocket Herd Book is a good investment

Fords Milker

Grahamholm Holsteins Average $53

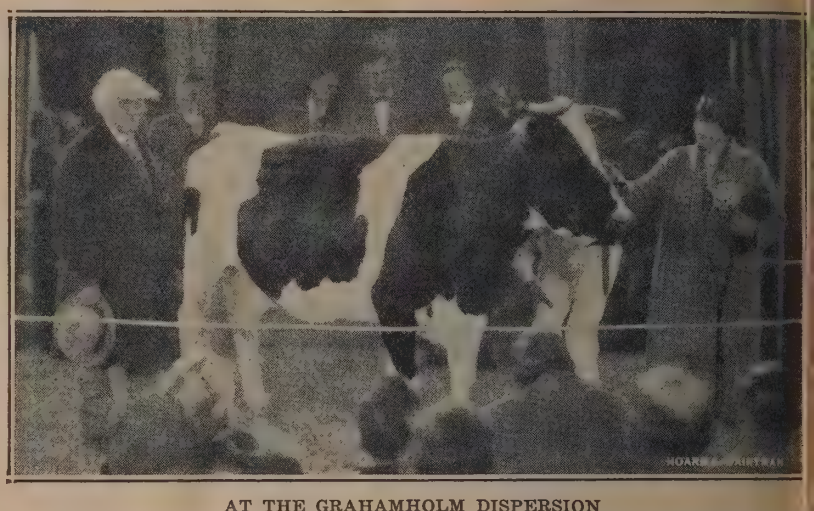
HOLSTEIN breeders from at least a dozen different states were at Rochester, Minn., May 27—28, to attend the dispersal sale of Dr. Christopher Graham's Grahamholm Holstein herd. This herd has for years had an enviable and deserved reputation among Holstein breeders everywhere. In it were developed world record producers and show ring winners and it was to be expected that properly managed such a sale would be successful. It was.

Ninety animals, the Grahamholm herd, sold for $47,950, an average of $533, an average which is exceptionally good including, as it does, every animal in the herd. Sixty-six females averaged $540 and 24 bulls, $513. Ten head sold for $1,000 or more and nine went for less than $200.

In addition to the Grahamholm herd, there were 22 animals consigned by Graham and Hanson, Mayowood Farms, Dinal, Graham and Olin, Schuager Bros. and Graham, and Dr. A. W. Adson, bringing the total number of animals sold to 112 for which the average price paid was $475.

The top price of the sale, $3,000, was paid by Mrs. F. E. Murphy, Minnesota, for that great cow, Grahamholm Colantha Segis Maid, that has three records above 30,000 lbs. milk, her total three years' production being 100,469.5 lbs. Grahamholm Colantha Pauline Segis, another great producer (1,426.75 lbs. butter, 34,291.8 lbs. milk in a year as a 4-year-old), was purchased by F. E. Murphy for $2,550, the second high price of the sale.

Halsey Sedgwick, Wisconsin, purchased the top bull, Grahamholm Pauline Piebe King, an 8 months' old calf, for $1,300. This youngster is sired by a grandson of Piebe Laura Ollie Homestead King and is from Grahamholm Intensity Colantha, a daughter of "Dutch" and Grahamholm Colantha Pauline Segis.



Dutchland Creamelle Colantha L (Dutch), 12-year-old sire who daughters have added so much to t Grahamholm herd, came into t ring, "guaranteed serviceable," a was sold to F. E. Murphy for $8 If he will sire but a half dozen a mals for Mr. Murphy, he may w prove a very profitable investment

F. E. Murphy was the heavi buyer, taking 16 head for $14,700.

The sale was managed by Me and Petersen; Mack, Thomps Hanson, and Wood did the selling.

Following is a list of those a mals selling for $500 or more a buyers:

Gentlemen, here is a smoke!

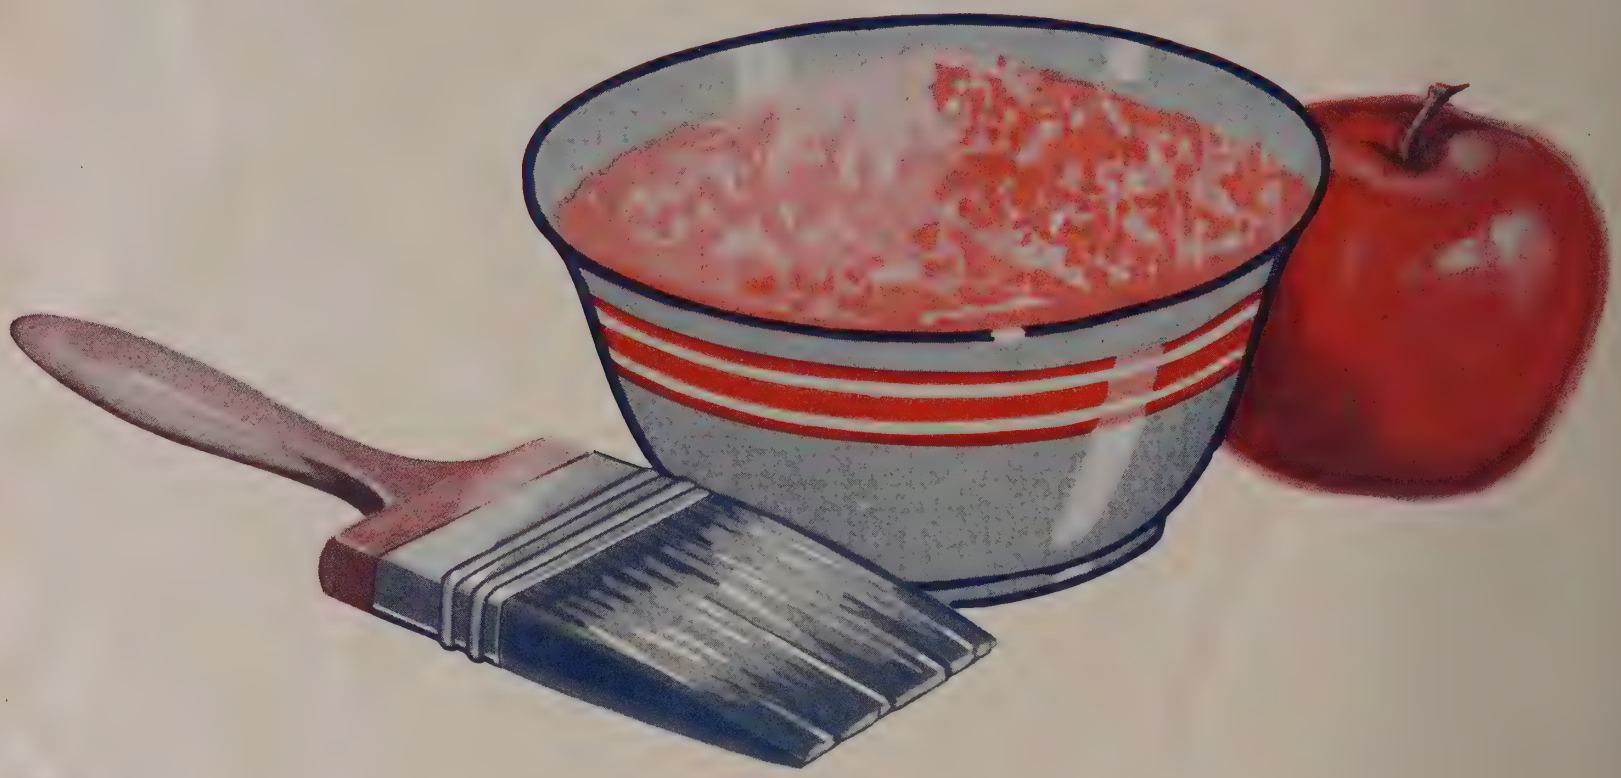
I WANT you to meet my friend, Prince Albert. And what I mean by "friend" is *friend!* Why, there's friendliness in the way the tidy red tin smiles down upon you from the dealer's shelf. P. A.'s fragrance is just as friendly when you swing back the lid.

Fragrance that says "Come and get it!" in language you can't mistake. Eagerly you fill your pipe and apply the match or the trick lighter. That first wonderful whiff confirms this friend-stuff I've been telling you about. Here is smoking with the brakes off.

Cool as a notice to "Please remit." Sweet as the recollection that you already have a receipt. Mild as winter in the tropics. Mild, but with that full, rich tobacco body that makes every pipe-load *a smoke.* Nothing else ever tasted just like that.

If you have never met Prince Albert, you have never known pipe-joy at the very top notch. No matter how set you appear to be, I urge you to try P. A. I can't talk here the way P. A. talks in a pipe. That's the real test. Get going today with good old P. A.

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.



PRINCE ALBERT

—no other tobacco is like it!

© 1927, R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

SHERWIN-WILLIAMS

You can't paint a house with *apple-sauce!*

WHEN the question of painting or repainting your house comes up, *don't be fooled* by a low price. Remember that *apple-sauce* is not restricted to pretty parlor speeches. There's a lot of it in "cheap" paint.

When anyone tells you, for example, that a *cheap* paint is "just as good as SWP" or any other high grade paint—that's pure *apple-sauce*—plainly exaggerated—unbelievable—too good to be true.

The reason "cheap" paint can be sold at a *low price* is because it is *low in quality*—made of cheap or skimped materials—which smell and look like paint but can't play the part on the house.

If you want proof of this, insist upon seeing the formula of the "cheap" paint, either on the label or in the literature of the company.

Then compare the materials used in making the *"cheap"* paint with the ingredients of fine old SWP House Paint. The SWP formula is always clearly printed on every can.

What the formula test shows

Suppose, for example, that you are buying Outside Gloss White: Note the big percentage of *White Lead Carbonate* and *White Lead Sulphate* used in SWP Outside Gloss White House Paint. White lead should be the *basic* ingredient of all white paint and light tints. It is to these paints exactly what flour is to bread.

See how much less of this basic ingredient is used in the average "cheap" white paint.

Zinc oxide, another costly pigment, is the next essential ingredient. A liberal percentage of zinc oxide combined with a large amount of white lead makes for a *balanced formula*—such as the formula of SWP Outside Gloss White House Paint. It assures a finish of superior wearing quality.

THE FINEST HOUSE PAINT THAT MONEY CAN BUY

HOUSE PAINT

More than 90% of the pigment content of SWP Outside Gloss White is made up of these two important ingredients — white lead and zinc oxide.

In the majority of "cheap" white paints you will find only 50% or less.

It is the liberal quantity of this expensive basic material in every can of SWP Outside Gloss White that gives this fine old paint its remarkable covering capacity.

In the darker colors like browns and greens, the "*balanced formula*" of SWP is even more important.

Naturally, the dark colors can contain little, if any, opaque white pigment such as white lead or zinc oxide.

Sherwin-Williams have the pick of the world's colors. Sherwin-Williams Dry Color Works produce practically everything except the natural earth and mineral colors.

That is why SWP colors are so rich, so permanent and so true to character.

Greater durability of the paint film on your house is assured by SWP due to the use of a specially treated, pure linseed oil—made in Sherwin-Williams' own linseed oil plant.

Price per gallon doesn't tell the cost of paint

When you read or someone tells you that a "low price" paint costs you less than SWP—that's more *apple-sauce*—unbelievable.

The place to figure the cost of paint is *on the wall*—not in the can—by the job—not by the gallon. Do that and here is what happens:

Each gallon of SWP, because of its remarkable *hiding* and *covering* ability, will properly beautify and protect 360 square feet of wall (2 coats).

The average "cheap" paint, made of inferior or skimpy materials, will cover only 250 square feet per gallon (2 coats)—or less.

SWP costs more per gallon. But each gallon covers 110 square feet more (2 coats). Therefore fewer gallons are needed.

Get an estimate on SWP for your house. Then get estimates on several "cheap" paints. Compare them.

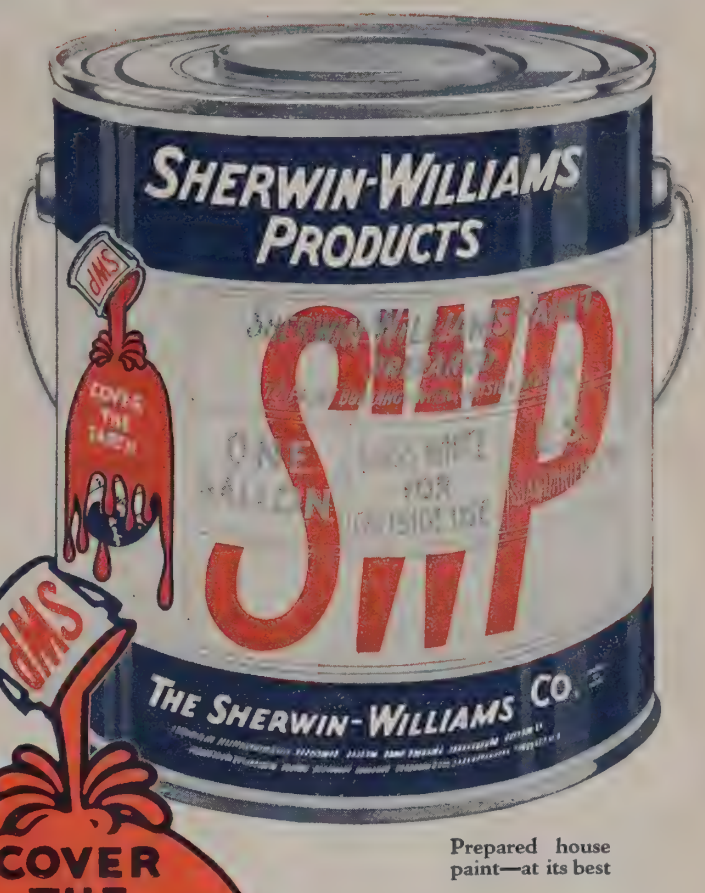
You will find that SWP House Paint costs no more for the amount you need than the cheap brands. And remember this: It costs just as much to *apply* the "cheap" paint as to apply SWP.

You get more years of service

You may hear or read alluring claims that a "cheap" paint is as durable as SWP. Plain apple-sauce — every word of it.

SWP with its fine materials, scientific grinding and mixing, dries to a firm, elastic, glossy finish. It will not chip, peel, chalk, or flake off. It weathers slowly.

Years after "cheap" paint has literally dried up and *blown away*, your SWP finish will still show a serviceable film. And when repainting *is* needed, you will save money because the finish will be in proper condition to take new paint.



That is why SWP often costs less than half as much per year.

Greater beauty, too

Finally there is a richness and beauty about SWP colors that no "cheap" paint can even approach. They give your house a rich, colorful beauty that is always a pleasure. They are weather fast—and they are non-fading.

Long after the colors of "cheap" paint have faded like an old shirt, the house finished with SWP shows practically no dimming of its original beauty.

Even after several years it can be washed with soap and water and the colors will come up unusually fresh and bright.

Prepared house paint—at its best

Call at "Paint Headquarters" and save money

SWP House Paint is sold the world over by thousands of dependable SWP dealers. Each one is "Paint Headquarters" in his locality. There is one near you.

Before you let "cheap" paint blind you to real economy, get his advice on your paint problem.

He will estimate your requirements in SWP. Compare it with the cost of "cheap" paint. Then remember the greater durability of fine old SWP—the beautiful colors that do not fade. Then decide.

If you want literature, color cards, a copy of the famous SWP Household Painting Guide, help on a decorative scheme, write us.

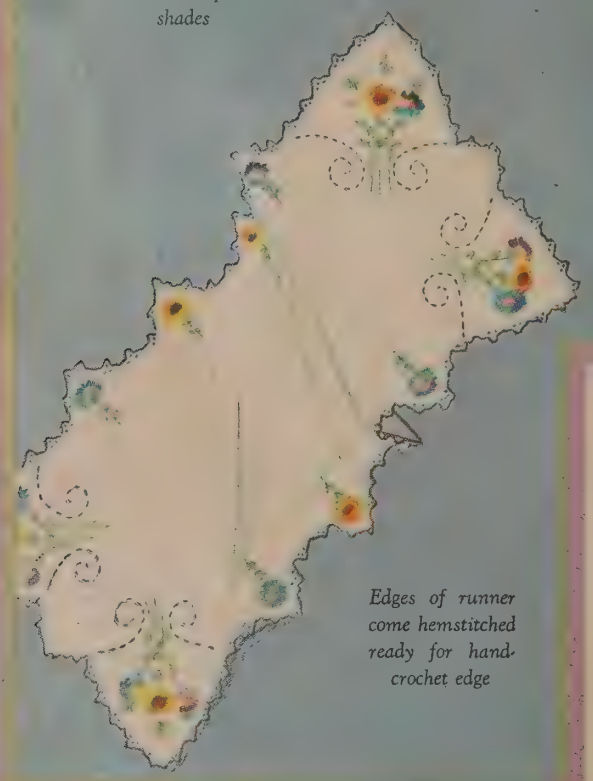
COSTS LESS PER SQ. FOOT . . . LESS PER YEAR . . . LESS PER JOB

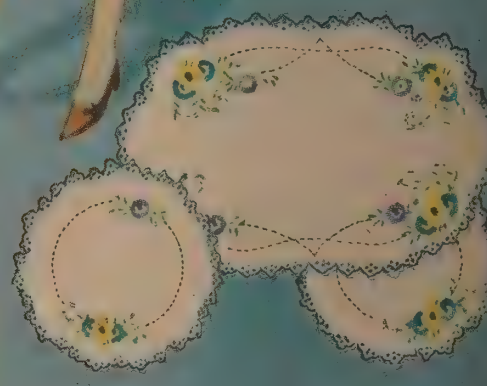


All Stamped ~ You Add the Embroidery

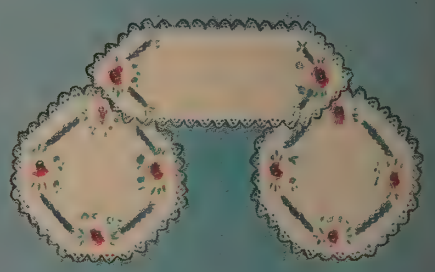
by Leonore Dunnigan

Pillow slips are lovely embroidered in white or pastel shades

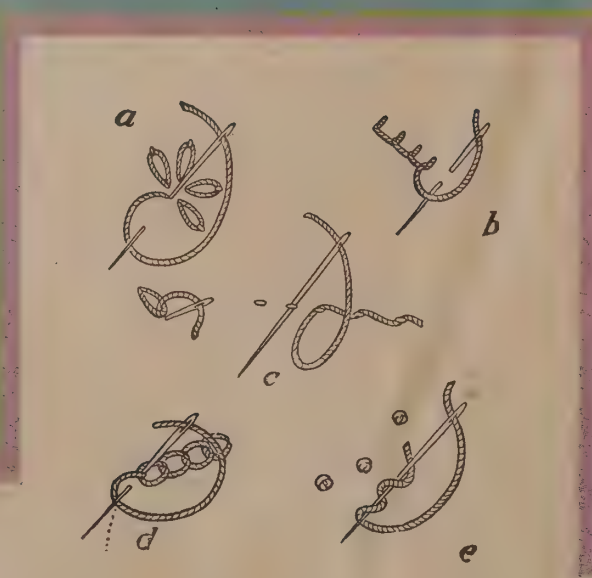
Edges of runner come hemstitched ready for hand-crochet edge



Charming dress in sheer voile for the very young



Clever aprons for those who would look attractive about the house



The very latest in a luncheon set with basket pockets to hold the napkins

A vanity set for girl's own room

NOTHING could be more interesting for summer porch work than these useful articles which come stamped, ready for your dainty touches of hand-embroidery. The work goes rapidly because the designs are simple and stitches easy.

Kitchen curtains No. 1642 come made up of white striped dimity, edged with green bindings. Each curtain measures one-half yard wide by one yard long, with one and one-half inch heading and one-half inch casing. Curtains are embroidered in yellow, orange, green and black.

For wear in the busy hours of the afternoon, Apron No. 1581, is charming in rose, blue or gold colored checked batiste. The design is dainty and effective worked in rose, blue, yellow, lavender, green and black.

Apron No. 1081 gives a well-dressed look. It comes stamped on unbleached muslin with pockets stamped on fast-colored blue chambray. Embroidery is in red, white, blue and black. The edges may be trimmed with blue edging or blue binding.

Mother's problem is solved for Miss One-year-old by this dainty little Dress, No. 1258, which comes made up in peach, yellow or blue voile with collar and cuffs edged with narrow Val lace. Clever flower design on front of skirt can be embroidered in less than an hour. The dress comes in one size only.

Luncheon set No. 1421 includes cloth one yard square and four 12-inch napkins. Design is stamped on linene. Clever little baskets of blue gingham at sides are really pockets to tuck the napkins in. The set is worked in shades of rose, yellow, green and black.

Runner No. 1065 is stamped on white linen with edges hemstitched. Flowers are embroidered in shades of rose, blue, yellow, lavender; leaves and stems in green.

Pillow slips No. 1775 are stamped on 42-inch wide tubing. Ends are hemstitched ready for hand-crochet edge.

Buffet set No. 1011 is interesting in shape and design. It measures 45 inches, including doilies. Edges come hemstitched.

Little sister will enjoy making this inexpensive Vanity set No. 1092 for her very own room. It comes stamped on white embroidery cloth.

Details for making embroidery stitches used on these articles are illustrated above: a. lazy daisy; b. blanket; c. twisted running; d. chain; e. French knot.

See another page for price list of articles.

Seasonable Live Stock Notes

JULY is a month when perhaps less attention is given to live stock than at any other time of the r. Two factors account for this, first being that less time is avail-, the second that of less attention ded. The ease of finding an ex-, however, is no reason for neg-ing some things that need atten- even in busy July.

Cows Ready for Fall Freshening

ows that are to freshen in Sep-ber and October need some at-ion beginning in July. Some s need more attention than rs. A good cow thinned down n hard work and bred to freshen y this fall must be given oppor-ty to regain her loss by the time calves or she will go down in pro-ion in her oncoming lactation. takes about three months to d such cows up to desired condi-. At least six weeks of that time ld be given over to complete rest relaxation from milk production. cows should begin to have grain e months before they are due to hen.

Keep Heifers Growing

he same suggestions just men-ed for cows apply also to preg- heifers due early this fall gh not for exactly the same rea-. Such heifers should be in good lition when they freshen. Ex-ence has shown that one should as much growth on heifers as ible before the double demand of inued growth and of milk pro-ion begins with the coming of first calf. As a rule, roughage titutes the major part of the ra- for heifers for the fifteen ths' period previous to calving. the last three months of this pe- however, or during the three ths just previous to calving, such rs could well have some grain. amount of grain to feed depends what on the character of the ure available as also on the con-n of the individual animals. The n mixture may be very simple, isting mostly of mixtures of home n grains, ground, and supple-ed lightly with bran and linseed .

Summer Feeding Open Sows

ow that the spring pigs are ed, able to shift for themselves, onger dependent on their dams, are we going to feed the open s? Frequently such sows are ected apparently because they orm no evident income or serv- until the beginning of the next ding season. Usually the really l sows are in thin condition at this time, having made sacrifices for the benefit of their pigs. Sows in such condition would just about maintain their weight on good forage without any grain; they might gain a few pounds. How much grain in addition to good pasture is enough to start them back up the hill towards a weight satisfactory at breeding time? Experimental evidence indicates that grain equal to one per cent of the weight of mature sows and to one and one quarter per cent of the weight of younger sows is sufficient. This means that a sow weighing 300 lbs. should have three pounds of grain daily.

July—Good Time to Cull Poultry

No management of the farm poultry flock is complete without a regular annual culling of the laying flock. Every dairyman who has had any experience with cow testing association work knows that culling out the low producing cows is a profitable thing to do. Hens are like cows in the same respect that there are low producing, unprofitable ones in the flock. If it were possible to pick these hens out at the beginning of the laying season it would be good business to do so. Not having a dependable way to identify such hens at that time we give them the benefit of the doubt; permit them to remain in the flock through the spring laying season. Low producing hens have now done about all they are going to do. If flock owners have not learned how to cull poultry they can easily do so by arranging a demonstration with their county agricultural agent.

Overtime for the Horse

Seasonal conditions sometimes upset our calculations of regular hours and even distribution of labor. A month ago scarcely any corn was planted, a lot of plowing was in waiting, much of it too wet to be turned. During the past month farm horses have of necessity been subjected to a strenuous overtime program. A good thing about the horse is that he can carry a big overload, at least, for a time. The horse, unlike his owner however, does not choose the kind of work he will do nor the amount; he eats whatever is put before him or goes hungry; if he has a bad tooth he worries along the best he can; if his body becomes bruised by ill-fitting harness he cannot change the fit nor discard the harness. In times of stress, of overload, of long hours under beating sun and sweating shoulders it is good business, it is right and just that farm horses be given every care and attention possible. They are entitled to it—a little more and better feed—first class grooming.

UNCLE DAVY FYFFE

In the background of the cow picture is the farm home of Uncle Davy Fyffe of Ohio tate University. It is always worth quite a bit of chugging off the main streets in or-er to drop into Uncle Davy's cubby hole of an office in the new animal industry building nd absorb some of his mellow life aspect and gracious kindness.—G. P. WILLIAMS, Ohio.

PROTECTION

For Five Cows or Fifty

Each one of your cows, whether you have five or fifty, represents so much capital investment, so much health and production to be safeguarded against disease and accident. That is why it is just as important in the small barn as in the big one to floor your stalls with Circle A Cork Brick. It is their value *per cow* that interests you.

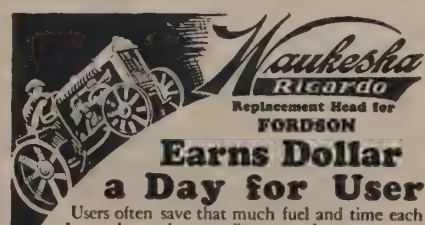
Floors of Circle A Cork Brick are warm, resilient and comfortable, nonabsorbent and nonslippery. They are easy to lay and remarkably durable, and their reasonable cost is a sound investment in protection from chill and dampness and dangerous slips and falls. Write for a sample brick and descriptive book. ARMSTRONG CORK & INSULATION COMPANY, *(Division of Armstrong Cork Company)*, 112 Twenty-fourth Street, Pittsburgh, Pa.

Circle A Cork Brick Floors

For Dairy Barns and Hog Houses

RUNNING WATER WITHOUT WORK

With a good Well and a good Windmill you can have all the water you want without work, worry or expense. Water from a well costs you nothing. The cost of an **Auto-Oiled Aermotor** is moderate. The expense for maintenance is so small that it need never be given a thought.



An Aermotor runs in the lightest breeze. It will also work safely and steadily in the heavy winds.

The **Auto-Oiled Aermotor** is completely self-oiling. The double gears run in oil in a tightly enclosed gear case which holds a year's supply of oil. When the mill is running the oil circulates through every bearing. Every moving part is constantly and completely oiled. Friction and wear are practically eliminated.

Auto-Oiled Aermotors have behind them a long record of successful operation. Their merits are known the world over. For further information write

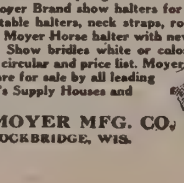
Pastures Are Going Strong

-BUT

There's Something More to Summer Feeding!

Times change. Not so long ago few farmers fed grain and Linseed Meal to dairy cows on pasture. Today this practice is growing by leaps and bounds.

What's the reason? Production! Higher production in summer, with richer, better balanced feed. Higher production in the fall, from reserve strength built up by summer feeding. Better initial flow from well-fed dry cows. And heifers that grow up to be bigger producers, when summer-fed on Linseed Meal.



Feeding Linseed Meal in summer helps you make money this year, next year, the year after. The new Summer Feeding booklet tells you how and why. Send for it!

This free booklet contains the secret of fallmilk production. *Send for it!*

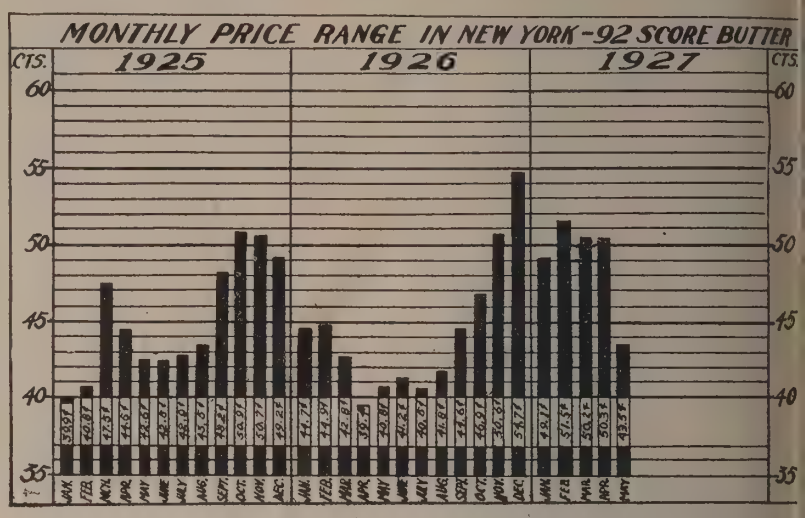
DAIRY MARKET NEWS

May Cheese



Cheese prices on the Wisconsin Boards averaged 22.3 cents in May, which is practically the same as April but is 3.2 cents above May of last year. Cheese receipts at the four large markets since January are six million pounds greater than a year ago, but despite this the storage at these markets is lowered by a like amount. This would indicate an increased consumption of nearly twelve million pounds despite an advance in price of three cents, a condition that is somewhat unusual and augurs well for cheese prices. The fore part of June saw an advance of a half cent over May.

Cheese production for the first three months of the year totaled 103,654,000 pounds, a decrease of two million pounds from last year. Net imports were 23,744,000 pounds, an increase of eight million pounds over last year. Storage on May 1 was 45,625,000 pounds, a decrease of two million pounds from last year. This brings the total estimated trade output for these four months to 153,828,000 pounds, a decrease of 3.7 per cent in apparent consumption of cheese as compared with the same period last year.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices on 92-score butter (extras) four of the principal markets, together receipts and storages:

	May 1927	April 1927	
Chicago	41.5	48.1	
New York	43.5	50.3	
Boston	43.8	51.1	
Philadelphia	44.3	51.3	
*Receipts for month	62,212	46,777	5
*Receipts since Jan. 1	227,321	165,110	22
*Storage (end of mo.)	9,470	960	1

*In thousands of pounds at the four kets (i. e.—000 omitted). Ninety score b

The May butter in New York City averaged 43.5 cents, which is 2.7 cents over last year and not quite a cent over two years ago. This is the lowest advance registered over corresponding months of the past two years, and the present indications are that the June average will show a similar condition.

wholesale prices for American cheese on the Wisconsin Primary Market during May:

	May 1927	April 1927	May 1926
Twins	21.9	21.7	18.5
Single Daisies	22.3	22.2	19.1
Longhorns	22.3	22.1	18.4
Square Prints	22.9	22.8	19.5
*Receipts since Jan. 1	76,192	56,175	70,368
*Receipts for month	20,017	15,801	14,156
*Storage end of month	9,634	9,202	15,111

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—000 omitted).

May Foreign Butter

The following table of foreign butter prices gives the average of weekly quotations as published by the U. S. Department of Agriculture:

Market	May 1927	April 1927	May 1926
	Cts.	Cts.	Cts.
New York	43.5	50.3	40.8
Chicago	41.5	48.1	39.4
Copenhagen	32.9	35.6	34.3
Berlin	33.7	36.4	35.2
London:

Argentine*	33.9	33.5	33.0
Siberian	33.3		32.3

*Unsalted.

May Butter

Butter averaged 43.5 cents in New York for May, a decline of 6.4 cents from April but still 2.1 cents above May a year ago. From the beginning to the close of the month the decline was two cents whereas last year prices rose by the same amount during a like period. Production is increasing and the promise of good pastures would indicate the probability of greater increases during June. Stocks are showing some accumulation and further declines have been in part prevented by dealers storing high cost butter to avoid losses.

Creamery butter production for the first four months of the year was 417,607,000 pounds, an increase of nine million pounds over last year. Net imports for the same period averaged 40.1 cents for May in Chicago, centralized butter at this market selling 40.8 cents. Jobbers' prices on extras so retailers averaged 43.9 cents in Chicag spread of 2.4 cents above wholesale.

Feed Market Situation

(By Grain, Hay, and Feed Market Service U. S. Department of Agricultu

Further advances in prices of feed g widened the outlet for by-product feeds d the last of May and the first of June together with the scanty offerings of feeds, resulted in higher feedstuffs prices though the market turned easier toward middle of June. Demand for most feeds slackened but stocks in all positions have reduced almost to a minimum and offe for immediate shipment are still being r ly absorbed at this writing (June 9) though buyers are cautious about future mitments. Weather conditions during tended toward somewhat larger than feeding requirements since the month somewhat cooler than normal in the nort portions of the United States, particular the Northeast where large amounts of chased feeds are normally consumed, an the Northwest.

The outlet for manufactured feeds has been widened recently by the higher p commanded by feed grains. Corn prices been forced sharply upward by the unfa ble weather in the Corn Belt and the del corn planting. Both corn and oats p have made some recessions from their r high points, largely because of somewhat favorable conditions during the past days but a level of nearly $1 a bushel fo 3 yellow corn at Chicago still favors incr use of the heavier wheat feeds.

Bran prices have declined around 50c in the past week and mills have become anxious to sell this commodity for ship during the last half of June and in l Shorts and middlings met a good dema some markets where quotations held prac ly steady but at other points they foll the downward trend in bran prices. ings of red dog seemed light and were re absorbed.

Cottonseed meal prices have again adv rapidly, although reports indicate that mand has been only moderate from don buyers and inquiry has been further rec at the advance. Reports are conflicting some dealers ascribing the higher prices more active export demand while others uncertainty of the new cotton crop.

Linseed meal has been irregular offerings at centralwestern and northwe

markets fully equal to buyers' needs in spite of reduced production. Trade reports from the paint industry state that the rainy weather in many sections this spring has interfered with painting and this has doubtless had some effect upon fresh business in linseed oil.

Manufacturers of gluten feed were still largely out of the market and where even limited supplies of this feed could be secured the prices were determined by resellers and covered a material range. Demand has been active, particularly in the Northeast.

Hominy feed has moved largely in sympathy with corn prices which advanced sharply and then turned easier the last few days. Offerings have been limited and yellow feed was practically unobtainable at Buffalo.

Alfalfa meal has been irregular with important buyers largely awaiting the movement of new crop meal which has been increasing. Tankage prices were further reduced to $60 a ton at the principal markets.

Quoted June 9

Standard spring wheat bran: $28 at Minneapolis, $32.50 at Buffalo, $35.50 at Philadelphia, $30.25 at Chicago, and $27 at Chicago. Hard winter wheat bran: $27 at Omaha and Kansas City, $32 at Fort Worth. Soft winter wheat bran: $37 at Philadelphia, $34 at Cincinnati, $29.50 at St. Louis.

Standard wheat middlings: $33.50 at Buffalo, $37 at Philadelphia, $32.25 at Chicago, and $29.75 at Minneapolis. Soft wheat middlings: $45 at Philadelphia, $37.50 at Cincinnati, $34.25 at St. Louis. Gray shorts: $31.50 at Omaha, $30.50 at Kansas City.

Cottonseed meal (43%): $46 at Philadelphia, $42.25 at Cincinnati, $42.50 at Chicago, $41.80 at Kansas City, $33 at Fort Worth.

Linseed meal (34%): $48.50 at Buffalo, $50.50 at Cincinnati, $47.75 at Chicago, $46 at Minneapolis, $51.60 at Omaha.

Gluten feed: $41.50 at Buffalo. White hominy feed: $39.50 at Buffalo, $33.50 at St. Louis. Alfalfa meal: $26.50 at Chicago, $23.50 at Omaha, and $21 at Kansas City.

Wisconsin May Condensery Prices

Forty-four condenseries reported to the Wisconsin Department of Markets the prices paid in May per hundred pounds milk delivered at their factories. Reduced to a common 3.5 per cent test basis, these prices ranged from $1.92 to $2.30, the average being $2.01.

Eighteen factories sent delayed reports for April, the average being $2.18. This is three cents above the previously reported average of $2.15 for 46 factories.

May Condensed Milk

(Report by U. S. Department of Agriculture)

Prices paid producers for 3.5% milk f. o. b. factory were as follows for May, covering those factories manufacturing both case and bulk goods:

Geographic sections	No. of factories	Price per cwt. Range	Ave.
New England	1	$2.20	$2.20
Middle Atlantic*	10	2.10—2.40	2.26
South Atlantic	1	2.15	2.15
E. North Central	75	1.92—2.31	2.00
W. North Central	6	1.62—2.20	1.96
South Central	1	1.90	1.90
North Western	6	1.75—1.79	1.76
South Western	10	1.75—2.10	1.90
United States	110	1.62—2.40	2.00

*Fifty-eight additional factories reported prices based in part on current month's wholesale butter quotation. Twenty-four factories reported prices not determined as yet and 20 reported factories closed.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for April:

	Range	Ave.
Condensed, per case	$5.26— 6.55	$ 5.92
Condensed, per cwt.	9.50—13.00	10.24
Evaporated, per case	3.65— 5.10	4.38
Evaporated, per cwt.	7.04— 9.42	8.49
Condensed skim, per cwt.	5.00— 8.50	5.87
Evaporated skim, per cwt.	2.75— 6.45	3.97

Philadelphia Milk Prices

The Inter-State Milk Producers' Association announces that the June basic price for milk will be $3.20 f. o. b. Philadelphia and $2.71 per hundred at receiving stations in 51—60-mile zone.

The May surplus prices were $2.25 first surplus and $1.90 second surplus f. o. b. Philadelphia. The May surplus prices at all receiving stations on railroads were $1.67 first surplus and $1.32 second surplus.

These are based on milk testing 3 per cent butterfat with a differential of 2 cents for each half point of test up and down.

Wisconsin April Butter

Wisconsin co-operative creameries paid producers a net price of 51.9 cents a pound for butterfat in April according to reports from 81 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 44.3 cents a pound for butter, making spread of 7.6 cents between the price received for butter and the price paid for fat.

The range in prices paid for fat was from 43.5 to 56 cents, with the price received for butter ranging from 44.5 to 49.6 cents. The overrun ranged from 21.1 to 23.9 per cent. Receipts of butterfat averaged 29,669 pounds per creamery.

Milwaukee May Milk

The Milwaukee Co-operative Milk Producers announce the following prices for the month of May:

For the portion sold as fluid milk, $2.90 per cwt.; and for the portion manufactured, $1.76 per cwt. These prices apply to 3.5 per cent milk delivered f. o. b. city, four cents being added or subtracted for each one-tenth of one per cent variation in test. Sixty-five per cent of the total receipts were sold as fluid.

Loudoun County (Va.) Guernsey Sale

The fifth annual spring sale of registered Guernsey cattle was held at Purcellville, Loudoun County, Virginia, May 20, under ideal weather conditions and with a large crowd present. The chief interest was centered in the very high class Langwater Farm consignment, Langwater Waldorf, a nine months' old son of Langwater Horatius and out of Imp. Slogan's Lady Astor of Langwater. This calf was purchased by Mr. Harper of the Massachusetts Guernsey Breeders' Association at $2,600 for Mr. C. E. Cotting of the Chedco Farm, Massachusetts. The six young bulls sold averaged $597.50. The 25 females sold, including a number of aged cows, averaged $225, the top being $340 for Fay of Pickering, a nine-year-old cow consigned by Whittig and Drew.

Fred Andrews of Ohio did the selling.

The Surge Milker
Pine Tree Milking Machine Co.

The Only Milker that

1 *gives the cow's teat the Real TUG of the calf—*
2 *and like the calf—TUGS harder and harder as the cow milks out—*
3 *and like the calf—gives EACH cow just the TUG she needs!*

Milks Like a Calf!

The Surge Milker does MORE than other milkers. The Surge *finishes* the job; other milkers only start it. Other milkers secure the milk by suction; some add a release or massaging action. The Surge does both! And then ADDS *The Real Tug of the Calf!* Yes, and like the calf—The Surge TUGS harder and harder as the cow milks out. AND—a quick, easy Surge Adjustment enables YOU to give *each* cow just the suck and TUG she needs to get ALL the milk. No other milker does or can do ALL THIS—which accounts for The Surge's well known ability to milk cows like no other machine has ever milked cows before.

6 Milkings FREE!

Right in Your Own Barn — With No Obligation to Buy

Mail coupon now for details of our amazing FREE Offer which gives you a chance to prove ALL THIS in your own barn, on your own cows—for 6 milkings FREE—and without the slightest obligation to buy! We also want you to see The Surge Milker milk out "that cow" you're ready now to bet can't be milked by machine. Our attractive price and Easy Terms will be another Surge feature you'll like.

Easy Terms
You can buy a Surge Milker on very easy terms. We'll figure to use any equipment you may have already in your barn. You'll be surprised how little it'll amount to. Mail coupon Now. It doesn't obligate you.

Mail Coupon for Free Book

We have just issued a NEW Surge catalog that tells you MORE about milking and milking machines than anything you've ever read. It's a very valuable book for any farmer milking cows to have. This coupon will bring it to you—FREE.

Rules for Operating the "Human Automobile"

"It takes approximately 100 man-hours to make a flivver and 1,000 man-hours to make a limousine, but so many hours to build a 'human automobile' that we number it in years," says Miss Gladys Coon, Boys' and Girls' Club Leader of the National Dairy Council. "In fact, it takes a whole lifetime to build a human auto that really meets life's wear and tear."

Some persons look like this year's models and some old second-hand cars because they do not know the new laws for drivers of human motor vehicles. These laws which hold in every state, as given by Miss Coon, are:

"Pull your machine up alongside of a filling station regularly three times a day and put into it high-test fuel such as leafy green vegetables, fresh fruit, milk, dark bread, and real butter. Do not use substitutes.

"Run your human automobile into the garage each night for nine hours of rest. Remember to turn on the fan by opening the windows and getting plenty of free air. This will prevent flat tires.

"Run your automobile body onto the wash rack daily.

"Keep the chewing apparatus clean. Brush it morning and night.

"Give your human car plenty of water to prevent a dry radiator.

"Visit expert mechanics regularly (the doctor once a year and the dentist at least twice a year). They can help you overhaul your machine and discover a little knock in the engine before you even hear it.

"Put a self-starter on your flesh-and-blood vehicle. That is, remember the main facts about putting pep in your motor every day."

By following the rules Miss Coon supplies for expert drivers and owners of cars, anyone can take out a license for the most beautiful custom-built chariot or any of the most elaborate sport models with power and speed. The "time-payments" are easily met, and years of constant wear will keep the old machine "just as good as the day it was taken out."

Are You Too Old to Learn?

Mrs. Black was watching our demonstration agents make "quick breads." She turned away saying, "That don't interest me, my family likes the way I cook and I guess I am too old to learn new tricks." I wonder how many of us are satisfied with the old ways of doing things and feel too old or indolent to change. Perhaps in ten years when I shall be as old as Mrs. Black now is, I will feel as she now does but it seems to me that I know so little and there is so much to learn. I find every meeting I have with anyone teaches me something; often positively, sometimes negatively, No one is too humble or lowly to teach us if we are but willing to learn.

One day a nomad tinsmith stopped at our house and asked if I had any soldering to do. I gave him a couple of milk pails, one with a broken ear handle, the other with a tiny rusted hole in the bottom. He mended them with painstaking care. His calling, if we could call it that, was humble indeed but he had pride in doing it well. He told me never to let a bit of rust stay in the pails but scour it out at once and make them last a year longer. "Better buy a dollar's worth of fruit for the children than a new pail." How many of us think of spending the money we save through economizing to provide extra treats in the way of new books, magazines, pictures, or music instead of putting it into necessities?

If you feel too old to learn, don't read this letter for I am going to tell you of some of the things I have learned this past year and they will not be interesting nor useful to you if you are in a rut and are satisfied to stay there.

I was scouring a pan one day with steel wool, a neighbor watching me said, "Don't you use soap with it, I do." I never had but I tried and found that it worked far better than when used alone. Not so long ago I bought a couple of Chore Balls. They were knit of copper wool and I think they are far superior to steel wool, they do not rust nor break off; they are a godsend in the dairy. We never need to worry about milk rock, that deposit that ofttimes forms on the insides of milk cans. A scouring once a week with a Chore Ball keeps them shining like new.

A good many women have had trouble with rings and spots left on clothing when cleaned with gasoline. Our demonstration agent said if they would use a dry cleaner with the gasoline it would eliminate that trouble. The term "dry cleaning" is sometimes misunderstood. To dry-clean, the garment is washed in gasoline, benzine, or some other similar substance. The dry cleaner that was recommended to us is called "Putnam's Dry Cleaner." It is a powder that is put into the gasoline and makes the gasoline just as much more efficient as soap does water. It is very probable that it can be purchased anywhere.

When sewing on buttons, put a pin across the top of the button and sew over it. Before breaking off your thread wind it around several times under the button, pull out your pin and you will have a neck under the button that will make it button easier and stay on longer.

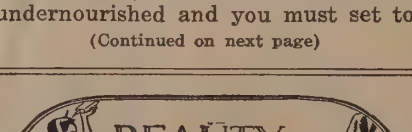
When making children's dresses or waists, plan for two of the same material. They may be trimmed differently. When they begin to wear out, the best parts of the two can be combined into one garment. I have found that by making my boys' waists with sport collars, full length sleeves with turn-back cuffs, and a waist band an inch or two too big around and fitted with a little pleat under each arm, they will fit the boys "growing like weeds" a much longer time than when made with regulation shirt collar styles. The sleeves I cut to the hand, put the cuff on and turn it back. When they get too short all I need to do is to turn them down and reverse the button.

A new salad, the Waldorf, was introduced at our community Thanksgiving dinner this past year. Several pronounced it the best they had ever tasted. Take equal amounts of diced sweetened raw apples and diced celery; add one-half amount broken walnut meats; mix well and serve on lettuce with boiled or mayonnaise dressing.

Delicious sandwiches are made from whole wheat bread buttered and spread with a filling of equal parts stewed and drained raisins and chopped nut meats moistened with mayonnaise.

Have you ever had trouble making your devil food cakes "red?" If you will use twice as much soda as is necessary to neutralize the sour milk and dissolve your cocoa in boiling water, not hot, but actually boiling, I think you will have no more trouble.

Before I close this I want to give you a recipe I have been planning to send you for a long time. It is as traditional of Virginia as Virginia baked ham and beaten biscuit. It is "Brunswick Stew."



Take one gallon hot water; one large or two small chickens (cut up as for a stew); 2 large onions; 2 slices bacon; one pint corn; one pint tomatoes; one cup fine bread or cracker crumbs; one cup butter; one teaspoon salt; one-half pod red pepper; one-half teaspoon white pepper. Put into a large soup pot the chicken, tomatoes, onions, and the bacon. Pour on the water and let simmer until tender. Remove the chicken and when cool remove bones, tough skin, and gristle. Chop fine and return to the pot adding the corn; boil twenty minutes; add butter, salt, bread crumbs, and pepper. The stew should be quite thick, but if too thick add boiling water.—GRACE GORDON.

Child Welfare

A few weeks ago (the first week in May) was known as "Health Week for the Children." A campaign was put on throughout the entire United States to awaken the mothers and teach them the necessity of guarding the health of their children. And there is no reason why the country mothers cannot undertake this work just as intelligently as the city mothers are doing.

The first thing to do is to take an inventory of your child. First take its weight and its height and consider whether or not he is nervous. There are tables of weights, that may be easily obtained, which you may use to compute for yourself as to whether or not your child is the correct weight for his age. Unless he is a very great deal overweight, say 20 lbs. or more, you need not feel any concern along that line. But the chances are far more likely that he is underweight, which means that he is undernourished and you must set to

(Continued on next page)

In our new SUMMER Fashion Magazine there is a three-page article called the Beauty Shoppe containing very good advice regarding the care of the complexion, the hands, etc.

Of course, the book also shows all the styles being worn by the smartly dressed women of New York. It's a book you simply cannot afford to be without. Send 10 cents in stamps or silver for your copy right now. Address Fashion Dept., Hoard's Dairyman, Ft. Atkinson, Wis.

Miscellaneous Fashions

No. 2708—Straightline Sports Frock. in sizes 16, 18 years, 36, 38, 40, and 42 in bust measure. The 36-inch size requires yards of 36-inch material with ½ yard of inch contrasting.

No. 2845—Crepe Roma and Metal Embroidery. Cuts in sizes 18 years, 36, 38, 40, 44, and 46 inches bust measure. The 36-size requires 3¼ yards of 40-inch mat with ½ yard of 36-inch contrasting.

No. 2992—Unmistakably New. Cuts sizes 18 years, 36, 38, 40, 42, 44, and 46 in bust measure. The 36-inch size requires yards of 40-inch material. Emb. No. 72 15c extra.

No. 3023—Smartly Simple. Cuts in 18 years, 36, 38, 40, 42, 44, and 46 in bust measure. The 36-inch size requires yards of 36-inch material with 1½ yard 27-inch contrasting.

How to Order Patterns

Enclose 10c in stamps or coins (wrap carefully) for each pattern ordered. your order to Fashion Department, Hoa Dairyman, Fort Atkinson, Wis. Every tern is seam-allowing and guaranteed to perfectly. Do not fail to state size.

Our patterns are made especially for us the leading fashion designers of New Y City. No stock of patterns is carried in office and, since all orders are forwarde the factory, kindly allow a reasonable for delivery of any pattern you order.

Mrs. Newlywed: Oh, George, I got to get the soap. Run over to grocer and get a couple of bars. want to wash the lettuce.—The P gressive Grocer.

o: to get your child up to normal
iving him the food that will build
is body and put on weight. The
ols in town, and some in the
try, are using milk for this pur-
s. Milk is one of the best foods.
] a town near us there were 89
rnourished children in school in
mber. At that time they start-
iving all of these children free
il; morning and afternoon each
i was given a bottle containing a
l pint of milk. By April first the
ber of undernourished children
decreased to 63. That alone tells
:ory.
'e must consider the matter of
c for our children very seriously.
would be surprised to learn how
ar children are given coffee to
i: at home. Why don't these
o ers make cocoa for their chil-
d s breakfasts instead? So many
i ren are allowed to eat entirely
o much candy. Children should
s whole wheat bread in the place
hite bread. Surely this is within
n power. If anyone has a chance
ve a child the right start, we on
e farm have this chance. The
i ren need plenty of milk, eggs,
d, and vegetables. Are your
i ren getting these things daily?
ie are all things that we can pro-
c at very little cost; we do not
e have to spend money to provide
n children with these foods.
(course, the schools in town have
e nurse look over the chil-
e periodically to see what physi-
l efects are present. Very often
e country you can secure a doc-
r rom the State Board of Health
h will give the children in your
h l a thorough physical examina-
n or, better yet, perhaps a doctor
c t dentist from a neighboring town
l donate his services and come
our schoolhouse. In this way
t children will be given a very
o ugh looking over, and a card
l be sent home to you telling you
at respects your child needs to
oked after, whether you need to
k him to a dentist or whether it
s visable to take him to your fam-
hysician to have his ears treated,
s yes tested, or his tonsils out. It
a be that he needs to have a goi-
r necked. It gives you a very fair
a e to check anything that might
t lead to serious trouble. Per-
l bad tonsils seem immaterial to
t but often diseased tonsils affect
e ntire health to such an extent
a it may cause rheumatism in one
s worst forms, or heart trouble of a serious nature may develop. If you cannot succeed in working up interest enough in your school for this work, you can at least take your children to your family physician and have him give them a thorough examination.

Let me stress this point, if your child needs attention in any way, take him to a first class physician for treatment; do not try to dose him up yourself with some patent medicine. No one can estimate the untold damage that is done each year, not alone to children but to adults, by taking doctor books for law and gospel, by making your own diagnosis, and then doping the family up with Somebody's Pain Relief. Why such a custom still prevails in this country of education and enlightenment is beyond my comprehension. It is a relic of ignorance. Your children need you to make a study of their health and their needs, but it must be done in a clear, level headed, sensible sort of way.—ETHEL MORRISON MARSDEN.

Summer Style Book Ready

Send today for our Summer Style Book. You will find it contains patterns for summer clothes which are fashionable and easy to make. Costs only 10c. Fashion Dept., Hoard's Dairyman, Ft. Atkinson, Wis.

The Food Value of Bananas

When I was a child my mother often used to say, "No, you may not have a banana. They are hard on little people's stomachs," and such, I believe, was the common opinion. But now we know that the banana is a very friendly food both for children and adults. The big thing to remember is that no person of any age should eat a banana that has a yellow skin and green tips. The skin must be thin and soft and flecked with brown spots before the banana is ready to eat. This is not only because the taste is improved but because certain chemical changes take place in the process of ripening that render the starch and sugar of the banana more digestible.

Most persons swallow a bite of banana practically whole which is another cause for their thinking them indigestible. Like all other food, bananas should be thoroughly chewed.

I can testify to the ability of the banana to put weight onto a thin adult. One of my family was thin to the danger point. You know some people are just naturally thin and we don't expect them to be anything else, just as we don't expect a race horse to have the weight of a draught horse. But there is a minimum of safety and something should be done to build the thin person up before this minimum is reached. In addition to having a good supply of milk, of sleep, and of nourishing food, this relative of mine took a middle-of-the-day nap (you can't recommend them too highly) and also ate slowly, either at meal time or between, a well ripened banana, being careful to chew it well. His gain, of course, was not due to the banana alone but it was a big factor.

Many persons with kidney trouble who are permitted very little in the way of sugars and starches can eat ripe banana with no disturbance whatever because of the easily assimilated sugar it contains.—LUCY THOMPSON.

Prices of Embroidery Articles on Color Page

We wish to call the attention of our farm women readers to the col- insert in this issue which displays beautiful stamped embroidery ar- cles. The designs are simple to work and reasonable in price and me stamped ready to embroider. Send in your order at once to Pat- rn Department, Hoard's Dairyman, Fort Atkinson, Wis.

The prices for these articles are as follows:

No. 1642—Kitchen Curtains come made up of striped dimity with lges bound in green binding. Price 59 cents.

No. 1092—Vanity Set comes stamped on fine embroidery cloth. rice 15 cents.

No. 1258—Child's dress comes made up stamped on fine voile in ach, yellow, or blue. Collar and cuffs edged with lace. Price $1.25.

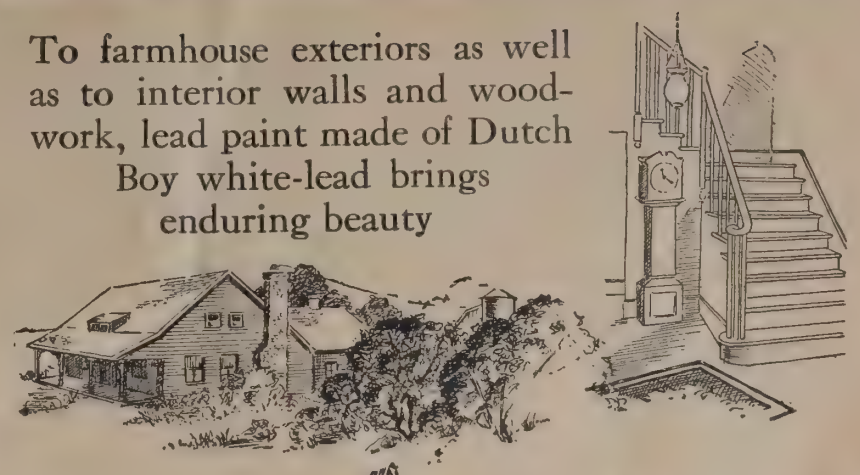
No. 1581—Apron stamped on good quality of sheer checked batiste pink, blue, or gold. One size only. Price 75 cents.

No. 1011—Buffet Set stamped on good quality Indian head. Edges e hemstitched. Price 50 cents.

No. 1421—Luncheon Set stamped on Indian head, set consists of oth 36"x36" and four napkins 12"x12". Price 75 cents.

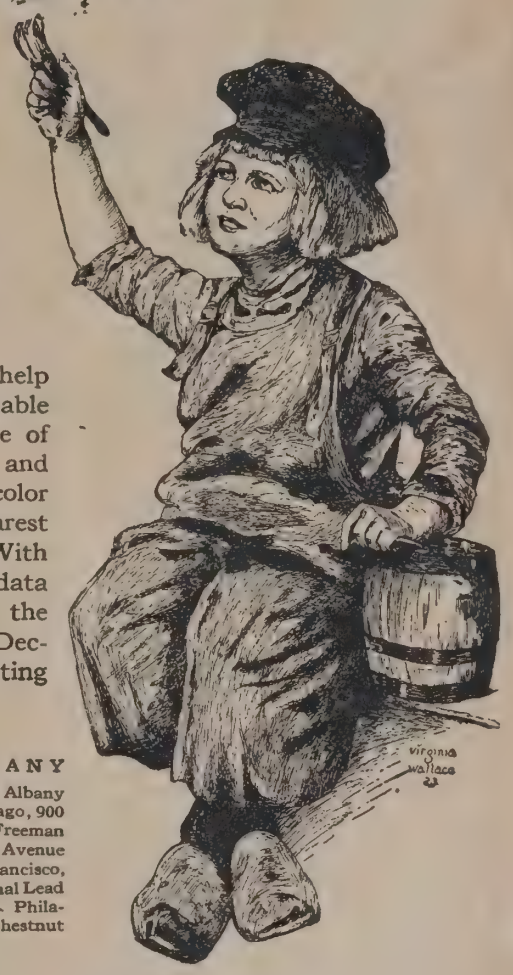
No. 1081—Apron stamped on unbleached muslin. Pockets of fast- olored blue chambray. One size only. Price 59 cents.

No. 1065—Runner stamped on white Indian head with edges hem- itched. Price 50 cents.



No. 1775—Pillow cases stamped on 42-inch tubing with edges hem- itched. Price 89 cents.

Send orders to Pattern Department, Hoard's Dairyman, Ft. Atkinson, /is. Be sure to enclose check or stamps.



Husband: Mary, here's a hair in the pie crust.

Wife: Looks like one of yours, John. It must have come off the rolling-pin. —The Progressive Grocer.

To farmhouse exteriors as well as to interior walls and woodwork, lead paint made of Dutch Boy white-lead brings enduring beauty

HOW will you protect the exteriors of your farm buildings from the ravages of the weather? How will you decorate your farm house inside? Our booklets—"Handbook on Painting" and "Decorating the Home" (printed in color)—will help you decide. They give valuable information about the use of paint and the selection and application of distinctive color treatments. Write to our nearest branch for these booklets. With them you get a decorator's data form to use if you desire the help of our Department of Decoration on any special painting problem about the farm.

The JOS. DICK MFG. CO., Dept. 10 Canton, O.

Do These Two Jobs at One Time—

1. Kill the Corn Borer — trap him in your silo!
2. Convert your green corn into silage while it is in the best condition.

You can do both these jobs at the same time with a Rowell Trojan Ensilage Cutter. It's a profit-maker in every way. Reduces cost of your silage and you can make a good profit for yourself filling silos for neighbors who do not have a cutter.

Features such as the perfectly balanced, guaranteed-for-life flywheel, Hyatt roller bearings, end-thrust bearings, automatic feeder, non-clog blower and twist-proof frame make it the *preferred* silo filler among farmers who have used all makes.

Write for catalog and free copy of valuable Government Silage Bulletins Index.

Preventing Disease and Promoting Growth

The illustration shown above is from the farm of Chalmer Miller, Indiana. These pigs are helping themselves to shelled corn, shorts, and tankage in separate self-feeders. They were farrowed early in clean quarters and when old enough were taken to a field free from worm eggs and disease germs. Here a temporary creep was made to give the pigs all they wanted and at the same time limit the feed of the sows.

Tuberculosis in Swine

According to the year book of the U. S. Department of Agriculture, 1924, the total number of hog carcasses condemned for all causes by the federal meat inspection service was 232,670, of which number 100,100 or 4.3 per cent were from tubercular hogs.

In 1907 the number of hogs retained because of tuberculosis by federal inspectors was 13.83 per thousand hogs slaughtered; in 1922 the number retained for a similar reason was 163.87 per thousand slaughtered. Within the same period the number of cattle carcasses retained because of this disease increased from 4.23 per thousand in 1907 to 27.05 in 1922.

As late as 1923 it was held by those in charge of tuberculosis eradication among cattle that this would eventually suffice to eliminate the disease from hogs. This view was put forward by Mohler, chief of the U. S. Bureau of Animal Industry in 1923, when he said in the annual report of the Department of Agriculture:

"It is believed that the area eradication work among cattle will eventually eliminate tuberculosis from swine, as the greatest source of infection in swine is known to be through following diseased cattle or drinking unpasteurized skimmilk from creameries."

Since 1923 post mortem examinations of hogs shipped to slaughter from modified accredited areas, those showing less than one-half of one per cent infection among all breeding cattle, have failed to show a corresponding and expected reduction in the number of hog carcasses retained. This situation lead investigators to inquire into the specific sources of infection affecting hogs.

In 1904 Weber and Bofinger demonstrated for the first time the presence of avian tubercle bacilli in the lymphnodes of a three-month-old pig. The actual susceptibility of swine to avian tuberculosis was first shown by De Jong in 1905. Since that time many investigators confirmed the findings of De Jong.

Prompted by the rapid increase in the number of hog carcasses retained because of tuberculosis and not satisfied with the assumption that most of the infections were of the bovine type of tubercle bacilli, Van Es and Martin of the Nebraska Experiment Station set up a thorough and exhaustive inquiry into the causes of tuberculosis of swine. The work is reported in Research Bulletin No. 30 of the Nebraska Station, issued in 1925.

This investigation included 250 Nebraska shipments of swine originating in 41 counties. The shipments represented 14,299 hogs of which not less than 2,781 or 19.5 per cent were retained on account of tuberculosis.

In slaughtering the hogs from each of these 250 consignments, laboratory samples were retained of the lymphnodes and these examined to determine whether the disease had been caused by bovine (mammalian) or avian (bird or chicken) or both of these organisms. Of the 250 lymphnode samples taken, 2 were discarded, 31 gave negative results, and 8 yielded results which made avian origin of infection highly probable. The number of consignments of hogs, the lymphnode samples of which yielded results permitting a definite interpretation, was 209.

To determine whether the organisms were of the avian, mammalian, or mixed type, guinea pigs and chickens known to be free from tuberculosis were inoculated with cultures prepared from the lymphnode samples taken from each of the 209 consignments of hogs. If the chickens developed tuberculosis and the guinea pigs did not, the type was classified as avian; if the reverse were found the type was mammalian, assumed to be bovine; if both the guinea pigs and chickens developed tuberculosis the type was classified as mixed avian and mammalian. The results of the investigation were as follows:

Type of infection	No. of consignments	% of consignments
Mammalian (bovine)	11	5.21
Avian (chicken)	185	88.51
Mixed (bovine and chicken)	13	6.22
Total	209	99.94

In a similar way investigations were made of 14 consignments of hogs from Hillsdale County, Michigan, a bovine accredited area. In 13 of these the avian type of tuberculosis was demonstrated and in one the mixed type was found.

Apparently, from the foregoing facts, the next step in the tuberculosis eradication program is with chickens if our hogs are to be made free from the disease.

Doing His Best

Not long ago Deacon Miller bought a horse and buggy and took his wife out one Sunday for a drive. They came to our neighboring town of Ossea and saw a sign which read, "Speed limit 15 miles per hour."

"Here, ma," said the deacon, excitedly, "you take the lines and drive, and I'll use the whip. Maybe we can make it."—Whiz Bang.

A TIP To Young FARMER-TOURISTS

Combine Business With Pleasure . .

DRIVE THROUGH THE FERTILE GENESEE VALLEY

(Livingston County)

WESTERN NEW YORK

Splendid paved roads through beautiful scenery. Here is your opportunity to inspect the splendid farms which we will sell or lease on very easy terms if you own your farm implements.

These farms are ideally suited for dairying, growing of canning crops, alfalfa, timothy hay, and small grains, and raising sheep, stock and feeders. Nearby markets, railroad facilities, schools and churches make these farms most desirable. Write for details of our plan for helping finance ambitious farmers. Geneseo is located on two of Western New York's best paved highways; is only 95 miles from Niagara Falls, 80 miles from Buffalo and 30 miles from Rochester. See us this summer. Write or call upon

YOUR BUILDINGS

the ASSETS everybody sees

THE appearance of farm buildings is the visible standard by which a farmer's customers and neighbors judge his good management. Your buildings, painted white or light colors with Eagle Pure White Lead in Oil, indicate careful attention to economy. They provide cheerful surroundings that add to the health and happiness of everyone on the farm.

Farmers who have painted with Eagle know its economy in first cost. When repainting time comes, they realize another economy of pure old paint. It wears away evenly, slowly. It is tough and elastic—does not crack or peel off—leaves a perfect, deep-anchored foundation for repainting.

Leading paint dealers sell Eagle. *The Eagle-Picher Lead Company, 140 North LaSalle Street—Chicago.*

You will appreciate the many helpful suggestions for mixing white lead paint contained in our "Tinting and Mixing Chart." Write today for your free copy.

Use FLY-KIL

Get rid of flies NOW

IMPROVED Dairyman's "Fly-Kil" is the only fly spray guaranteed to protect cows all day from fly annoyance and it kills instantly every fly it hits. It is colorless, sweet smelling and will not burn the hide or taint milk.

It Pays to Use DAIRYMAN'S "FLY-KIL"

You'll find spraying "Fly-Kil" will pay big returns by increased milk production. Many successful dairymen have proved that, whether cows are in good pastures or are being fed in the barn, the daily use of Dairyman's "Fly-Kil" pays. Fly-pestered cows that don't eat don't produce.

HOUSEHOLD "FLY-KIL"

kills flies, mosquitoes and other insects in residences, camps and stores. Thousands of customers are finding it just as valuable in the house as Dairyman's "Fly-Kil" is in the barn.

Both kinds of "Fly-Kil" are sold only by our direct representatives who demonstrate on your own farm.

We need men who can put in full time selling "Fly-Kil." Write at once giving your age and name of your banker or other reference.

"FLY-KIL" DIVISION

Willhelm Oil Company Saint Paul, Minn.

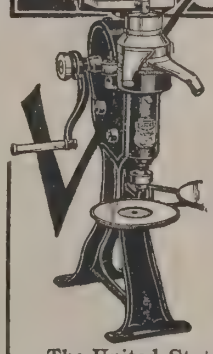
Sole makers and distributors

Genuine "FLY-KIL"

New York Milk Consumption Increases

The annual milk consumption in New York increased from 74.1 quarts per capita in 1890 to 137.5 quarts in 1924, an increase of 85 per cent. During the same period the consumption of cream increased from 2.4 quarts per capita to 8 quarts, an increase of 233 per cent in 35 years. Reducing the cream to its milk equivalent the total milk consumption was 88 quarts in 1890 as compared with 183.5 quarts in 1924, an increase of over 100 per cent in 35 years.

This compares quite favorably with the federal report showing that the annual per capita consumption of milk and cream in terms of milk increased from 169.6 quarts per capita 1917 to 221.2 quarts in 1926, an increase of 30 per cent in ten years.



People and pins are useless when they lose their heads.

IOWA JUNIOR DAIRY CATTLE JUDGES VISIT PRESIDENT COOLIDGE

On their way to England to represent the United States in the International Junior Dairy Cattle Judging Contest, the party stopped off to see the sights in the nation's capitol. Here they are at the White House after having been received by President Coolidge. Left to right they are: Mrs. Kaiser; Professor Fordyce Ely, Iowa State College; Gertrude Kaiser; Lloyd Kaiser; Mrs. Ely; Kenneth Walter; Roy Combs, county agent and coach of team.

O.K.

You'll Be Proud to Own It

YOU can buy a cheaper separator—just as you can buy a cheaper cow, or a cheaper car. But the cheaper separator will be costing you heavily both in money and satisfaction for years to come.

The United States has won the O.K. of dairymen by excelling in the three real points where one separator can be superior to another—close skimming, easy running, long life.

Why be satisfied with less than the United States can give you?

Seven sizes—motor or gas engine attachments on larger sizes. Separators or repair parts available from eight warehouses.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

HOW TO FIT THE DAIRY CALF FOR THE SHOW RING

IF you are planning to show your calf at the fair or round-up, your preparations should start months before the time of showing. Fitting should begin on the inside of your calf—in other words, the calf should be properly fed.

Feeding—Skimmilk, if available, can be fed with profit to calves until a year of age. In addition, feed some silage, legume hay if possible, and a good concentrate mixture. There are several grain combinations—equal parts by weight of corn, barley, and oats with a small amount of oil meal is a suggested mixture. Linseed meal is a good conditioner, and a small handful may well be fed with every meal. The grains should be ground for calves over 6 months of age. Don't forget the water bucket and the salt lick for your calf.

Barn Care—Do you brush your calf every day? You should. Grooming is important if you want your calf to be in the best possible show condition. Do you keep your calf in a comfortable box stall? Do you clean out the stall daily and keep plenty of fresh bedding in it? Your calf appreciates attention of this sort. Does your calf get plenty of sunshine and fresh air in the barn? This is good health insurance.

Pasturing and Blanketing—It is not usually advisable to pasture young calves. Good showmen keep the stock they plan to show under cover and blanketed, beginning this practice some months before show time. Sunshine beating down on unblanketed animals in pasture or lot several hours a day tends to make their coats rough. Blanketing helps keep the flies off, helps keep the animals clean, sweats and conditions the hide, helps make the hair smooth. You can make a simple blanket for your calf from a couple of gunny sacks. Shape the neck and put on several tie straps.

Leading and Posing—Is your calf halter broke? No calf has good show ring manners until it has learned to lead quietly, neither running ahead of nor lagging unduly behind its master. It takes time and patience and ceaseless practice to teach your calf this important lesson. Take your calf out for a walk every day, fifteen or twenty minutes at least, and longer if you can. The exercise is good for both you and the calf. When your calf has become accustomed to being led, practice standing it in such a position that it will show well before the judge. This is called posing. The feet should be so placed under the animal that the calf's top line is as straight and its rump as level as possible. The calf should not be stretched out like a saddle horse.

Showman's Outfit—There are a few useful articles that every showman ought to have. An outfit might include a bar of soap, a pail, a scrub brush, a blanket, a halter, a sharp knife, a rasp (or a piece of glass will do), some strips of emery paper, clippers, flannel cloths, a pair of shears, a brush, some string, pumice stone, and sweet oil, a comb for the switch.

Clipping—It is sometimes well to clip your calf all over a couple of weeks before showing, particularly if its coat looks a little shaggy. At any rate, before you enter the show ring, be sure the tail is clipped and the head trimmed. Best results will be secured by clipping against the grain of the hair. In clipping the head, work from the outside to the center. The long hair in the ears can be trimmed out with scissors. Start at the switch and clip up on the tail. Either power or hand clippers may be used.

Washing—A bath with plenty of soap and elbow grease should be given your calf before showing. Select a warm day and use other precautions, such as blanketing, to prevent your calf from catching cold. Give especial attention to scrubbing thoroughly the tail switch. You may follow the suds treatment with a good rinsing, ending with a rinse in blueing water. To make the switch fluffy, braid it the night before show day in several small braids, tying each; then tie the switch up to keep it clean; unbraid just before entering the ring and comb it out.

Horns and Hoofs—The first step in polishing the horns is to scrape the surface. If you use a rasp, work it across and around the horn. If you use a small piece of glass, scrape the long way of the horn, beginning at the head and pushing out. Be careful not to scrape deep enough to draw blood. After scraping, take a strip of coarse sand paper or emery paper and rub around the horn vigorously. Follow this with a finer sa paper. Then apply a polish made powdered pumice stone and sweet procurable at the drug store, mix into a paste. Rub hard with a fl nel cloth. The hoofs should be th oughly cleaned, trimmed, and th polished in the same manner.

Grooming—It is hard to beat good hand rub after brushing, make the coat glossy. Put one ha over the other in wi mill fashion and rub w the grain of the hair. gentle rub-down with flannel cloth moister in sweet oil puts on finishing touches. Ol oil can also be used a rub-down. Be care not to use so much oil to leave the hair r greasy.

In the Show Ring—When showing on wh side of the calf sho you stand? Usually the left side, sometim in front, rarely on right. Stand on the l side in leading. Hold lead rope in the ha nearest the calf. Do use two hands to ho the lead rope. The tra rope should be ne ly coiled and held in same hand with wh you are leading. Ne stand between your c and the judge.

Every minute that are in the ring should give undivi attention to your job showing. There is time to talk to Joh Smith who is show the calf next to yo Nor is there time look around and see w is watching you. K one eye on the ju and the other eye your calf! Be ready move where the jud wants you to when wants you to.

Have your calf l its best all the time! posing your calf for judge avoid standing in holes or on unle ground. Don't let calf go to sleep, but the other hand, d work with it so m that you make it Ir- vous. Be courteous at all times. If the judge asks you a question, answ him to the best of your ability with proper respect.

Ask the judge! After the show is over and the awards have b made, if you want to know why judge did thus and so, ask him i courteous way. That's how learn. Asking a few intelligent qu tions may mean the differe between success and failure the ne time. Don't argue with the jud even if you think your calf sho have gone higher. Just remem that he is hired because of his ab ty to place the animals as he sees th

IMPORTANT STEPS IN FITTING THE DAIRY CALF FOR THE SHOW RING. THE TOP PICTURES SHOW HOW TO CLIP THE HEAD, FILE, SANDPAPER, AND POLISH THE HORNS. THE MIDDLE PICTURES ILLUSTRATE BLANKETING AND HOW TO CLIP THE TAIL. BRUSHING THE CALF REGULARLY AND GIVING A GOOD SOAP SUDS BATH BEFORE SHOWING ARE THE LESSONS TAUGHT IN THE TWO LOWER PICTURES.

Junior Letters

A Prize Winning Club Girl

ard's Dairyman Juniors:—I am 12 years I live on a 70-acre farm. If I pass the y examinations this year, I am going gh school.

have been in the 4-H club work three t. The second year it was organized, I secretary. We named it "The Anti- Club," and an Anti-Can't Club it is for first year we organized, we had the second best club in Pierce County and the second year we got the first prize over 20 other organized clubs in the county. We received $10 given by the fair association and a banner, and our club leader was one of the best club leaders in the state.

This year I was in calf and sewing clubs. I had no previous experience in sewing at all. I exhibited 4 garments at the fair and got fourth prize on a sewing apron and first on a dress, first on my grade Guernsey calf, and first as the best cattle judge. I was the only girl entered in this contest. I would like to hear from some of the Juniors. My address is R. 1, Bay City, Wisconsin.

Helen Stogdill.

A Champion Baker

Hoard's Dairyman Juniors:—I have won many prizes in my three years of calf club work, winning first prize in the calf club at the Wisconsin Valley Fair and also a trip to the state fair. I was 13 last December. I also belong to three other clubs—sewing, baking, and thrift.

My team mate, Leona Sazama, and myself demonstrated in baking at the Wisconsin Valley Fair and won second place. In our demonstration at the state fair we had a score of 87. The name of our leader for baking, sewing, and thrift is Mrs. Carl Ryer. I also thank her for the help she has given us.

MADELINE WITTE, WISCONSIN, AND HER CALF

Our Achievement Day was held in Cherokee and was well attended. Our county club leader, C. J. McAleavy, announced that I was the champion baking girl of Marathon County for which I received the 50-lb. sack of flour and a free trip to the Minnesota State Fair from the Russell Miller Milling Company. Leona Sazama received 25 lbs. of sugar from the Menomonie Sugar Company. There are seven girls in our baking club and fifteen in sewing and thrift. My address is R. 3, Box 32, Colby, Wisconsin. Madeline Witte.

My Holstein Cow

Hoard's Dairyman Juniors:—Here is a little poem which I have written about my Holstein cow. She was given to me on my twelfth birthday. She freshened in October and gives about eleven quarts of milk twice a day. I am raising her calf on milk and oil meal:

Some boys may like their Guernseys
Others the Jerseys too,
Some talk much of the Shorthorns,
But mine is the Holstein true.

She is an ideal dairy cow,
Her milk is rich as wine;
I feed her but three times a day
And, boys, she's looking fine.

She is an easy keeper,
Pa says she has 'em all beat
In milking, feeding and in growing,
For she's always on her feet.

Now as I said before, boys,
She's the best, but I alone cannot bark
For you may love some others fair
But none can pass the Holstein's mark.

I will answer anybody who writes me that I may become better acquainted and do more for the club. My address is Box 203, West De Pere, Wisconsin. John M. Peters.

Trapping Mink

Hoard's Dairyman Juniors:—The thing which I like best on the junior page is Mr. Gurler's hunting trip in the north woods, because I like to hunt and trap. Every winter I go out and trap mink which I sell. They are the highest priced animals that I can catch here. I caught one big mink this winter which I sold for ten dollars. My address is Round Lake, Minnesota.

Frank de Boom.

Raising Pigs

Hoard's Dairyman Juniors:—Received the fob, pin, and the creed and was very glad to get them. Also received your letter and the membership blank and am sending it with this letter filled by my friend Howard. I am sure he will make a good club member because we ride to school together and we know each other pretty well.

Howard and I each raised a fat barrow last summer. Howard's pig weighed pretty nearly 200 lbs. at the end of the feeding season making a gain of 1¾ lbs. a day. Mine weighed 245 lbs. and gained 2½ lbs. a day. We showed at three fairs—one school fair and two county fairs. My pig took first at the school fair and Howard's took second. At the first county fair, I went way down taking fourth and Howard one less. At the last fair my barrow went down to fifth place and Howard's went up to third.

The pig that I raised fell down in its front feet after I took it to the school fair. We sold our pigs for 12½ cents a pound which was 2½ cents higher than city market. We are both going to raise pigs next year. My address is Dunnell, Minnesota. Lloyd Gee.

Boys and Girls

Join the Juniors. No costs to u. If some member of your mily is a subscriber to Hoard's airyman and you are under 20 ars of age use the coupon.

's' and girls' club representa- from every state will join in an pment and demonstration of work here the week of June 16. J. S. Army furnishes the tents, he club organizations and the rs in this part of the extension e in the U. S. Department of ulture take care of the rest of xpense and equipment. Those are coming are the winners of mpetition between the clubs in state for preeminent work. It novel affair, arranged entirely without expense to the government. Probably about 200 representatives of this great piece of educational work will take part.

Much interest is being shown here in the coming World Poultry Congress at Ottawa. The poultry workers in the Department of Agriculture and the representatives of the National Poultry Council expect to make a big showing of the American poultry industry and the work done by the government on behalf of that industry. A big government exhibit will be shown in the general exhibit to be staged by the Canadian organization in charge.

D. L. James, dairy and poultry marketing specialist of the Bureau of Agricultural Economics, has resigned and joined the agricultural staff of the U. S. Chamber of Commerce.

Spring Farm Cleaning

HOARD'S DAIRYMAN:—The pile of trash and rubbish shown in the accompanying illustration is the result of a couple of days cleaning up around the farmstead. The next thing immediately in order was a bonfire and the whole aspect of the place was improved for the season.

This bonfire was on a rented farm and the place has been kept much

AND THEN A BONFIRE

neater ever since. It is very easy to harbor junk and let old discarded gates rot where they were unhung or permit rotten rails and warped boards to stick around. Much of this rubbish was drawn forth from under buildings where it had been thrown out of the way or once laid aside for possible use and then permitted to become worthless with age and rotting.

With this cluttered accumulation out of the way, the dead trees and gaunt dead limbs were taken down and a second bonfire was burned in the same place. A widely scattered ash pile was hauled away from the back yard and the whole vicinity where it had been was ridded of this unsightly stuff.

A wet spring day is much worth while when it is employed in picking up rubbish and getting rid of junk that clutters the place and always in the way and harboring weeds one year after another.

Ohio. G. P. WILLIAMS.

National Dairy Exposition Judges

Judges of national reputation have been selected to place the ribbons on the leading dairy cattle of the country at the National Dairy Exhibition in Memphis next October. The judging will begin with Jerseys on Tuesday, October 18. J. B. Fitch, head of the dairy husbandry department of Kansas State Agricultural College, will make the awards.

On Wednesday, October 19, Ayrshires will be judged by John Cochrane, manager of Wendover Farm, New Jersey, and Brown Swiss placings will be made by H. H. Kildee, head of the dairy husbandry department of Iowa State College. Thursday, October 20, will be Guernsey day, and John S. Clark, manager of Caumsett Farm, Long Island, will place the ribbons. Holsteins will be judged Friday, October 21, by Ward W. Stevens, New York.

Early indications point to a good entry which will result in a show that will maintain the established high standards of the National as a dairy cattle exhibition. In addition to the exhibits of pure-bred animals of the five leading dairy breeds, there will be classes for grade cows having production records, and for calves owned by boys and girls in dairy club work.

The foreman looked him up and down. "Are you a mechanic?" he asked.

"No sorr," was the answer. "Oi'm a McCarthy."—Exchange.

McCormick-Deering Manure Spreader *and the* **FARMALL**

The Road to Farm Profit

The old-fashioned ways that made money in farming before the war have gone by the board. Everything is changed. The man who sticks to the old ideas has a hard time of it nowadays.

Yields must be increased, operations must be handled more efficiently, labor must be saved. Better equipment must produce bigger and better crops at lower costs—or there is little profit.

First, fertility must be put in the soil, and the scientific method is by McCormick-Deering Manure Spreader. The speed and ease with which fresh manure is handled and put evenly on the fields with this spreader encourages the full use of valuable fertility.

You will like the design and build of the McCormick-Deering. It is light of draft, simple and strong, and does everything a good spreader should do. Low for easy loading, with adjustments for different manures and light or heavy spreading. Built in two sizes. Note the features at right. Other machines *handle* crops; this machine *increases* them.

See this spreader at the McCormick-Deering dealer's store.

Note these features:
1. Auto Steer
2. Front Wheels Track with Rear
3. Two All-Steel Beaters
4. Wide-Spread Spiral
5. Narrow Tread
6. Self-Aligning Bearings
7. Steel Main Frame
8. Six Feed Speeds
9. Positive Apron Drive

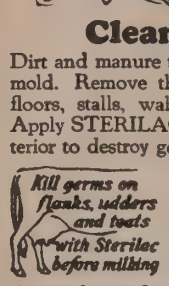
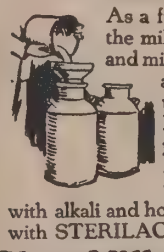
STERILAC



REG. U. S. PAT. OFF.

An Ideal Disinfectant

Clean Barns



Dirt and manure teem with bacteria and mold. Remove the dirt and keep the floors, stalls, walls and ceiling clean. Apply STERILAC to all parts of the interior to destroy germs and to provide a suitable place to produce milk of low bacterial count.

Clean Cows

Wash the flanks, udders and teats first with water and then apply a solution of STERILAC to kill all bacteria. This practice is very important in the production of milk having a low bacterial count. It is a reliable procedure in the production of wholesome milk.

Clean Utensils

As a further precaution keep the milk cans, strainer, pails and milking machine and separator clean. Rinse these utensils with STERILAC solution before putting milk into them. After milking scrub thoroughly all utensils with alkali and hot water and then rinse with STERILAC solution.

Clean Milking Machines

In case the milking machine is used the metal parts should be thoroughly cleaned in alkali and hot water and then cleansed in a solution of STERILAC. The rubber tubing, rubber cups and other parts of the milking machine which are difficult to clean should soak in the STERILAC solution until ready to use. It is an easy way of keeping the machine clean.

Clean Bottling Machine and Bottles

STERILAC solution is ideal for use in bottling machines. After the bottling machine is cleaned with alkali and hot water let a solution of STERILAC run through outlets to destroy germs which may be present in the corners and other interior parts of the machine. STERILAC solution will also destroy germs inside bottles.

Sterilac for Dairy Factories

Dairymen, butter, cheese and ice cream makers will find STERILAC a most satisfactory disinfectant. It destroys the germs which produce off flavors and other forms of spoilage. Use STERILAC solution in milk vats, separators and anywhere in the factory where dairy products are produced. STERILAC destroys all kinds of bacteria which spoil milk and produce disease. STERILAC kills germs—*it does* not spoil milk which comes in contact with it. That is a very good reason why STERILAC is safe to use to produce milk that is safe to serve as human food.

Ideal to Handle

STERILAC comes in powder form—will keep its strength. Sunlight does not affect it. Special introductory offer of enough STERILAC to make 60 gallons of the strength used for ordinary sanitation $1.00. Complete directions enclosed.

Send a dollar bill today.
A trial will convince you.

The Sterilac Company
North Chicago, Illinois

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Controlling Bovine Abortion

Field work conducted for some two years by the Veterinary Department of the Wisconsin Experiment Station, in conjunction with a local veterinarian, has developed facts of interest relative to the control of the contagious abortion disease of cows. The work undertaken has involved the testing of blood from all of the cattle on three farms; removal of all reacting cattle to one of the farms; the maintenance of stable hygiene and sanitation; and the surgical treatment of animals needing such attention.

A report of the work says that in the herd where this work has been done the number of reacting cows gradually became fewer with each test, and large numbers of abortions such as were experienced in previous years did not occur. The groups of reacting cows proved profitable from the standpoint of milk production and reproduction. In the course of the work it was found that cows whose blood did not react to the agglutination test in such a way as to indicate positive infection eventually, on retests, gave positive reactions and most of them subsequently aborted. From this experience it has been concluded that in an infected herd all cows whose blood serum agglutinates in a dilution of 1—50, and ordinarily interpreted as a negative reaction, should be considered infected. From this and other studies Dr. F. B. Hadley and his co-workers are hopeful that infectious abortion in cattle ultimately can be controlled. They offer in Wisconsin Bulletin 388, the following suggestions as a guide to the management of infected herds:

Semi-annual Testing of the Herd—The first test is to establish the diagnosis; subsequent tests are to detect infection in the incipient stages. Best results follow the use of an agglutination test fluid prepared by pooling several strains of *Bacterium abortus* of bovine origin. Retests may well be made between 60 and 90 days, and continued until no new reactors to the test appear.

Removal of Reactors—All cattle that react should be immediately removed from the main herd to a separate barn, given special attendants, and provided with separate pasture and yard facilities. The calves from the reacting herd may be removed to the clean herd only after they have been weaned and are on a ration used as a substitute for milk. This precaution is taken to prevent the calves carrying the abortion organisms to the clean herd in the contents of their intestinal tracts. Reactors that eventually become non-reactors should never be returned to the clean herd, but retained in the reacting herd until they become unprofitable, when they should be sold for slaughter.

Stable Hygiene and Sanitation—Provision should be made for maternity stalls with tight walls to prevent all communication with other stalls so that each can be occupied as well as disinfected without disturbing the occupants of the others. The parturient cow should be placed in the disinfected maternity stall and left there until she has ceased to discharge and veterinary examination reveals a clean, normal genital tract.

The stall should be cleaned of all litter and disinfected before another cow is introduced. The litter should be taken to a field where cows have no access. Special rubber footwear and clothing should be worn by attendants when working about infected cattle, and this apparel removed before the person enters the barn where the clean cattle are stabled. The stable used for the clean cattle should be disinfected at frequent intervals to guard against any infection that may have been carried in from the maternity stable. Special sanitary precautions should be taken with reacting cows at the time of calving and with aborters. All virgin heifers and heifers carrying their first calves should be kept away from the rest of the herd until the time of freshening to prevent possible infection.

Vaccination—This is an additional preventive measure designed to increase the resistance of the body against infection with abortion bacilli. It should be decided upon only after a thorough study of the herd has been made by a competent veterinarian. Vaccination should be restricted to cattle in infected herds. Only unbred cows and heifers may be vaccinated with safety as the living abortion bacilli constituting the vaccine might induce abortion in pregnant animals. At least 60 days should pass after vaccination before the cattle are permitted service.

Abortion

Would like to have your advice regarding my cows? I have had heifers drop their calves about two weeks too soon and others that don't clean after calving now. I can take a blood test. What can I do if half the herd is infected? Can I sell the sick ones and be safe in keeping the rest?

Ethrick, Wis. E. D.

Have a sample of blood from each cow and heifer in the herd tested by the experts of the veterinary department of the state experiment station at Madison. The reactors and cows that have aborted may be isolated and fitted for the butcher, if you think that advisable, otherwise the only recourse will be to have them vaccinated. That, however, is not recommended as a general practice. The animals that do not react to the test may be retained if kept in new sanitary quarters that have not been infected by affected cows. Study a bulletin on the subject that you can obtain from the experiment station.

Retained Afterbirth

I was told by a dairyman here that he has been successful in removing the afterbirth from cows with a douche. I had the veterinarian remove one from my cow and she died 3 weeks later. I have another that seems to be going the same way. I hate to experiment. Which is best, a veterinarian or a wash-out?

Greenville, Miss. G. F. Z.

Douching will not remove a retained afterbirth. It has to be removed by hand for which a veterinarian should be employed. To prevent infection, which sometimes proves fatal, he will be careful to use disinfectants. A good plan is to insert in the womb, after removal of the afterbirth, a gelatin capsule containing one-half an ounce each of iodoform and boric acid. Isolate the cow and cleanse, disinfect, and whitewash the stall she has occupied, including the floor and gutter.

Poultry on the Dairy Farm

Rearing Chicks Indoors

chicks have to run out of in order to live, avoid leg-ess, and grow, has long been a g question. If a method of e and care can be found which omote the normal growth and ty of baby chicks indoors with-g-weakness and the other ills ted with confinement, certain of the poultry industry would olutionized.

Recent Investigations

ne effort to solve this problem ous experiments have been ted at the Ohio Station during st three years, all of which re- in varying degrees of failure the last year when cod oil was used in the ration. with albino rats, notably that Wisconsin Station, had previ- ndicated cod liver oil to be an onal source of vitamin A and ntirachitic factor. Since the n requirements of growing were known to be high, a con- ed form of the vitamins, such nd in cod liver oil, offered a ssibility. In the first test the er oil was used in connection synthetic ration composed of l foodstuffs but the usual fail- the chicks followed. When it ed at the rate of 5 per cent mple ration consisting of nat- eds, it proved highly success- growth without mortality or akness during the 12 weeks of eriment; whereas the group of receiving the same ration with lk and green sprouted oats in- of the cod liver oil failed as ore. The basal ration consist- equal parts of ground yellow nd standard wheat middlings) to which was added 16 per asein and 4 per cent mineral e (bone ash 60, calcium car- 20, and sodium chloride 20).

chicks were two weeks old at ginning of the experiment. iver oil in comparison with lk and sprouted oats in ration of 15 White Leghorn chicks shown by the results at the 12 weeks:

tion	Wt. per bird lbs.	Relative growth per cent	No. of chicks with leg-weakness	Mortality
liver	1.7	100	None	None
to d green oats	.8	44	All	2

h and other experiments in the dicate the failure of skimmilk en sprouted oats to meet the ments of young chicks for and prevention of leg-weak- nen confined indoors; whereas, er oil appears to be highly ef- in this respect.

recently, another experiment nducted with day-old White n chicks taken directly from ubator and placed on the ex- ntal rations. Again the cod l ration proved successful but case only 2½ per cent was the ration. Another group d the basal plus 15 per cent g yolk, which proved some- uperior even to cod liver oil.

The basal ration consisted of ground white corn, standard wheat middlings, casein, and mineral mixture (same as in the previous experiment).

The results from feeding the basal ration alone, with cod liver oil, and with raw-egg yolk to lots of 20 White Leghorn chicks in confinement:

	Average weight lbs. at 6 wks.	10 wks.	Relative growth in % at 10 wks.	No. with leg-weakness	Mortality
Basal ration alone	.24	(dead)		all	20
Basal ration plus 2½% cod liver oil	.60	1.42	100	0	0
Basal ration plus 15% raw-egg yolk	.75	1.59	112	0	0

It will be observed that the groups receiving the basal ration plus the cod liver oil or the raw-egg yolk made practically normal growth without mortality or leg-weakness, whereas the basal ration alone was a complete failure.

Suggestions for Poultry Raisers

While the evidence cited indicates that it is not impossible to raise chicks successfully indoors to three months of age and secure about normal growth without mortality or leg-weakness, much remains to be accomplished before it can be regarded as applicable for general practice by poultry raisers. In the first place, the available supply of cod liver oil or incubator eggs would be insufficient. Nevertheless it appears that a limited application of these valuable supplements to the chick ration may be advantageously made by a considerable number of poultry raisers.

If cod liver oil is to be used it can in most cases be secured in 1- or 5-gallon lots from the local druggist or from a wholesale druggist. In feeding, the cod liver oil is mixed with the dry mash at the rate of 2 per cent or 2 pounds (a quart) to each 100 lbs. of dry mash. To incorporate the oil with the mash the oil is first mixed with a small portion of the mash which is in turn mixed with the balance of the mash. For example, if it is desired to prepare 50 lbs. of the cod liver oil mash, 1 lb. (or 1 pint) of the oil is thoroughly mixed with 5 or 10 lbs. of the mash. Then this mixture is added to the remaining 40 or 45 lbs. of mash and carefully mixed. Since cod liver oil loses its valuable properties shortly after it is mixed with the mash, care should be taken not to prepare more of the cod liver oil mash than will be consumed within 5 or 6 days.

When it is desired to feed incubator eggs, the infertile and dead-germ eggs can often be secured in quantity from the local hatchery. To avoid any chance of infectious disease, especially bacilliary white diarrhea, the eggs should be boiled a half hour. After passing them through a food chopper or sausage mill they may be mixed at the rate of 20 to 30 per cent by weight with a dry mash composed of ground yellow corn, ground oats (sifted), standard wheat middlings (shorts), and bran, equal parts, to which is added 10 per cent meat scraps and 5 per cent fine bone meal.

The egg material mixed with the dry mash will make a slightly moistened crumbly mash, which may be fed the birds in open shallow troughs three times daily, being careful to feed only what will be cleaned up in 15 or 20 minutes. A very light feed of scratch grain may be scattered in the litter at 9 a. m. and 3 p. m., the scratch grain being fed sparingly for exercise so as to encourage a heavier consumption of the egg mash. The chicks may be given the egg mash after the third day in the brooder or just after they have learned to eat the scratch grain. Skimmilk, if available, may be given the chicks to drink, in which case the meat scraps may be omitted from the mash.

These suggestions relative to the use of cod liver oil or eggs apply particularly to early hatched chicks, which must be confined indoors on account of the weather or for any other cause. These agents may be regarded as specifics to be employed for meeting the emergency conditions arising from having to keep the chicks confined indoors. Later hatched chicks, that can be permitted out of doors after 2 or 3 weeks where they can get an abundance of green feed and sunshine, will have no need for cod liver oil, but in the case of feeding incubator eggs it would be advisable to continue their use until the chicks are 8 or 10 weeks old, especially if skimmilk is not available. —D. C. Kennard, Ohio Experiment Station.

"Is a chicken big enough to eat when it's three weeks old?"

"O' course not."

"Then how in the world does it live?"—Black & Blue Jay.

Belswood Jersey Sale

A. F. Block of Waukesha, Wis., held the first annual sale of his Belswood Jerseys at the farm May 24. He offered 42 head of good cattle that were well fitted and were worth more than the average price they brought, $139. Inasmuch as Mr. Block plans to hold an annual sale, however, this fact should profit him in time, for buyers at the farm Friday should be well satisfied with their purchases.

Half of the offering went to out of state buyers, the largest number being purchased by Mr. Frank Astroth, field representative of the American Jersey Cattle Club, for a northern Minnesota community. Four animals went above $200, the top price, $255, being paid by Miss Clara Barker, Wisconsin, for a very good 5-year-old cow.

Andrews and Benjamin did the selling with Harry Jenkins in the box.

Following are the averages for cattle of the different age classes: three bulls averaged $155; 16 heifers under 2 years, $123; 7 two-year-olds $140; 1 three-year-old brought $135; 15 cows 4 years old or over averaged $139.

Liming Pays in Indiana

According to a report from the Indiana Agricultural Experiment Station, three-fourths of the cultivated lands of that state are acid. About 25 per cent are so acid that clover will fail almost every year. On another 25 per cent much clover fails when seasons are unfavorable.

On seven of the nine experiment fields where the effect of liming has been studied, the values of crop increases produced by the application of ground limestone have ranged from $6.06 to $32.08 per acre per rotation of corn, wheat, and clover, averaging $14.10 at crop prices prevailing in 1922.

In Scott County a total of 2½ tons of ground limestone has produced crop increases valued at $32.32 per acre during the last 16 years. In Jennings County, the value of crop increases has been $45 per acre from four tons of ground limestone applied in 1912. On two fields in Lawrence County, the average value of crop increases has been $13.62 per acre during five years from an application of 3.5 tons of ground limestone per acre at the beginning. In Greene County, two tons of ground limestone per acre applied in 1912 and two tons more in 1920 have produced crop increases valued at $33.50 per acre to the end of 1921. In Gibson County, three tons of ground limestone applied in 1915 produced crop increases valued at $31.32 in the first six years. In Laporte County four tons of ground limestone per acre applied in 1909 produced crop increases valued at $53.45 per acre in the following five years.

Land O' Lakes Leads Dairy Co-ops.

(Continued from page 647)

trated at Minneapolis, Duluth, and some other point where it could be properly inspected, graded, weighed, tested, branded, and made ready for uniform carload shipments. Warehousing and storage facilities were to be furnished at these places by the association. Railroad companies agree to co-operate in helping with the concentration program by improving shipping facilities.

Practices which enabled the creameries to produce the high quality Land O' Lakes butter and to build up the extensive merchandising program which places this butter on markets all over the world are very interesting. They will be discussed in the next article.

Jersey Breed Shows Remarkably Healthy Growth

The growth of the Jersey breed has been steady and *certain* for over half a century. The average yearly increase in registration since 1904 is 9.7 per cent. The number of grades has also shown a great increase and government figures show that there are now over ten million grade Jerseys in the United States.

This enormous growth is due to the efficiency and quality of the Jersey cow and her products.

Write now for a copy of the illustrated booklet "Jersey Facts".

THE AMERICAN JERSEY CATTLE CLUB, Dept. B, 324 West 23d St., NEW YORK, N. Y.

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.
THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

A Fitting Head for Your Herd

No bull is better qualified head your herd than an Ay shire. His daughters wi prove deep-milking cows tha are an improvement over the dams in both type and produ tion—and Ayrshire milk bring the high dollar.

Even the calves of an Ay shire bull make market-toppin veal.

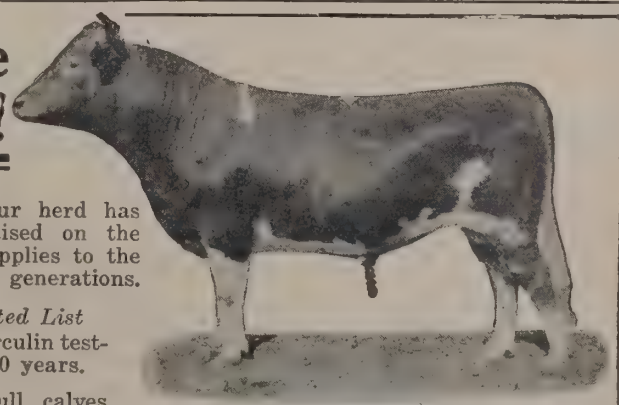
LINWOOD GUERNSEY FARM
Homer Rundell, Owner, Livingston, Wis.



Need a Sire Next Fall?

Every female in our herd has been bred and raised on the farm. The same applies to the females for several generations.

Herd on Accredited List
Has also been tuberculin tested for more than 20 years.

We believe our bull calves are well worth your consideration if you want a bull calf that will improve your herd.

HOARD'S DAIRYMAN FARM
FORT ATKINSON WISCONSIN

ANTON'S KING CONFIDENCE—43517 A. R.
Photo taken when two years of age.

SIRE—Anton's May King, sold for $7000.00. DAM—Ma Chere Confidence who has a two year old record of 511.82 lbs. butterfat and a junior four year old record of 764 lbs. butterfat. Ma Chere Confidence is one of the outstanding daughters of the famous Jardinier's Masher. A. K. C. sires excellent udders, long deep bodies, straight top lines, and real production. His first nineteen A. R. daughters average 8739.4 lbs. milk and 422.8 lbs. butterfat on two time milking and herd rations at the average age of three and one-nineteenth years.

Fond du Lac (Wis.) Guernsey Sale

At the annual Fond du Lac, Wis., Guernsey sale, held May 25, 74 animals, including 27 from the herd of A. M. Sisler & Son of Minnesota, sold for $13,240, an average of $179. Top price of the sale was $475 for a very good 4-year-old granddaughter of Ladysmith's Cherub consigned by A. W. Laurence, Wisconsin. She was purchased by Drew Ten Broeck of Illinois, as were three other good ones, for J. T. Sweeney of Pennsylvania.

Pohlman and Benjamin did the selling and the sale was managed by C. L. Hill & Son.

The averages for cattle of the different age classes are as follows: Nineteen heifers under 2 years averaged $121; 5 two-year-olds, $162; 9 three-year-olds, $201; 30 cows, $214; and 11 bulls, $175.

The scaffolding had broken, and with the hastily summoned doctor, Mike knelt at his fellow-workman's side. "Spake to me, Pat. Spake to me!" he cried, bending in anxiety over the victim of the accident.

"I'm sorry, my man," interposed the physician, "but Pat is dead."

"No, No, Pat, can't you spake to me?"

Pat, his eyes slowly opening, fixed on the questioner a look of injured dignity and slowly reproved—

"Be still, Mike! The doctor knows best!"—Success Magazine.

GUERNSEYS

Every Saturday Night Sees Forty More Tested Guernseys

Every seven days we add the names of forty more pure-bred Guernsey cows that have completed official records of milk and fat production.

—

That means you can always buy Guernsey bulls out of tested dams,—a profit-winning combination. Find out for yourself.

HOLSTEINS

STATE and FEDERAL TESTED HOLSTEINS
BUY FROM AN AREA TESTED COUNTY
The county that furnished both Grand Champions National Dairy Show 1926. 50 pure-bred bulls—serviceable age, priced from $125 to $1000. Two entire pure-bred herds—owners have some of the best blood but for good reasons are quitting farming. 500 herds of the best bred grades to select from.
Write or wire for information or appointments.
WAUKESHA COUNTY HOLSTEIN-BREEDERS' ASSOCIATION
133 Barstow St., Waukesha, Wis.

Dicmere Holsteins
30-LB. SHOW BULL
We are offering a very typy January calf from a 30-lb. 3-year-old dam. His sire, Walcowis Ollie Abbekirk, is a 968-lb. son of that grand champion, Iowana Sir Ollie. The herd is federal accredited. Write today if you want a good bull at a reasonable price.
H. E. DICKINSON, Oconomowoc, Wis.

Milford Meadows
Calves from SIR TRIUNE PANSY are here and are everything we hoped for. To date we have 12 heifers and 5 bulls and all very much alike, straight and evenly marked. The dam of every calf will have a record.
Ask us about them.
W. W. KINYON, LAKE MILLS, WIS.

JEFFERSON COUNTY HOLSTEINS
Registered Heifers at Farmers' Prices
We have some very good bargains in heifers 9 to 18 months old. We also have registered and grade cows for sale. Area tested county. A full time fieldman at your service. All inquiries answered promptly.
JEFFERSON COUNTY HOLSTEIN BREEDERS' ASSOCIATION,
C. W. Clingan, Field Sec., Ft. Atkinson, Wis.

ORMSBYS and OLLIES
Three daughters of our two great herd bulls have just completed records of over 33 lbs. butter, 7 days, as three- and four-year-olds. Three are now milking over 100 lbs. milk a day, and are being continued on yearly work. Sons of those sired by either PIETERTJE ORMSBY MERCEDES DELLA, greatest producing son of 37th. sire of World's Champions or by Sir Ollie Mooie Watson, highest son of old Iowana Sir Ollie, both National Dairy Show champions, offered at prices that will make you money.
F. H. BOYLE, Prop., PEEBLES, WIS.
L. F. MURPHY, MGR.

SERVICEABLE BULLS
GRAND CHAMPION BREEDING
Two serviceable bulls for sale. Very typy. From 23-lb. Jr. 3-yr.-old and 24-lb. 4-yr.-old dams. One is by the All-American Johanna Rag Apple Pabst. The other by Walcowis Sir Ollie from a daughter of Johanna Rag Apple Pabst. Have also a few bull calves of the same breeding. Federal accredited herd. Write
JOS. E. PIEK, R. 5, HARTFORD, WIS.

SERVICEABLE BULLS—FOUNDATION HEIFERS
Have a number of good bulls between 9 and 12 mos. of age. Would sell a ½ interest in some of the best ones to the right parties. Can spare several pure-bred females, some bred to the 1926 National Grand Champion Holstein bull.
BAIRD BROS., Box 177, WAUKESHA, WIS.

REGISTERED HEIFERS—COWS
Because our barn space is limited we offer 12 head, registered heifers or cows. You can select what you want from the herd at farmers' prices. All females sired by 1000-lb. Homestead bull. Accredited area tested county.
CHAS. HUGHES & SON, NEENAH, WIS.

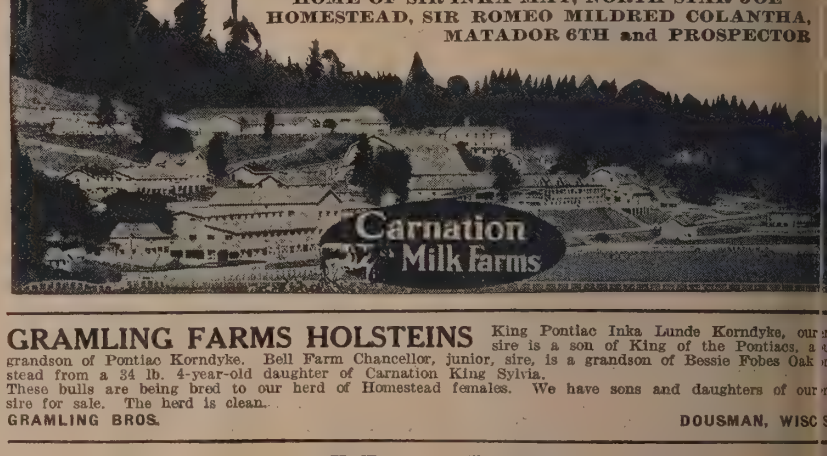
Would You Invest $350 to $500 In A 3-Year-old BULL

Of Richest Breeding and Siring Good Type . .

WE have located two bulls, born in 1924, backed by 5 generations of the greatest producing cows of the Holstein breed, State and World champions.

We believe that when a great producing cow transmits great production to her daughters, granddaughters and great granddaughters—30-pound and 1000-pound production—the man who needs greater production will do well to buy a bull of this breeding.

These bulls are 100% healthy, easy to handle and sure breeders. The bulls themselves are not wonderful individuals but they are siring handsome calves that are in demand by good breeders.



The owners of these bulls have finished with them and these bulls can be purchased for less than half their true value, namely $350 and $500.

We Will Gladly Furnish Full Particulars

Address all correspondence to

Mobiloil flies with Lindbergh

3700-mile flight gives lubrication its greatest test in history

Capt. Lindbergh has cabled us as follows:

"Vacuum Oil Company
New York

In my flight from New York to Paris my engine was lubricated with Gargoyle Mobiloil "B" and I am happy to say that it gave me every satisfaction. My engine functioned perfectly.

Charles A. Lindbergh"

NEVER before have the skill and daring of a single man gripped the world as did Captain Charles Lindbergh in his flight from New York to Paris.

In 33½ hours he flew 3700 miles—alone in a single-motored plane—through fair weather, storm and sleet—straight to his goal and to fame.

Success!

Gargoyle Mobiloil "B" lubricated the engine of Captain Lindbergh's plane, "The Spirit of St. Louis." And what a test of lubrication! That single engine must function perfectly. The slightest mishap meant instant danger, perhaps the end of the flight in the waters of the Atlantic.

The engine did function perfectly. The flight was a success.

Thus another great adventure is written into the vivid history of American aviation in which Gargoyle Mobiloil has played its part.

When Commander Byrd flew to the North Pole—he used Mobiloil "B."

When the U. S. Army fliers flew around the World in 1924—they used Mobiloil "B."

When Lieutenant Maughan flew across the United States "from dawn-to-dusk"—he used Mobiloil "B."

When Capt. Lindbergh flew from San Diego to New York—he used Mobiloil "B."

And now when Capt. Lindbergh flies from New York to Paris he uses Mobiloil "B."

In a press interview shortly after his arrival in Paris, Lindbergh said, "We had the worst possible weather for over 1000 miles over the open sea. I cannot say too much for the way the ship and the motor stood up under all this punishment."

Science wins!

The Gargoyle Mobiloil Engineers are co stantly and directly associated with ae nautic developments just as they have be with automobile developments from the ginning. Their Chart of Automobile Reco mendations is approved by 609 manufact ers of automobiles, farm tractors, mo trucks and other automotive equipment.

The Mobiloil "B" used by Lindbergh *not a special oil.* It was the same Mobili "B" which is used today by thousands farmers in their tractors and trucks. It the same Mobiloil "B" which, with other grades of Mobiloil, is for sale by go dealers everywhere.

Put this scientific margin of safety into lubrication of your own motor. You v find Mobiloil the most economical as wel the safest oil to use.

HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING

olume 72, No. 13 Fort Atkinson, Wisconsin July 10, 1927

Mr. Dave Fitzpatrick, of Tillamook County, Oregon, and his grade Jersey, "Daisy." Mr. Fitzpatrick's splendid Jersey herd was high herd (20 cows or over) in the Tillamook County Cow Testing Association.

Aside from this fine achievement, a number of Mr. Fitzpatrick's individual cows made exceptional records in their various classes. This herd is milked entirely with the De Laval Milker.

Famous Tillamook Record-Making Cows Milked with De Laval Milker

Summary of 1927 *Annual Report* of Tillamook County (Oregon) Cow Testing Association

High Herds Over 20 Cows

Name	Address	No. of cows	Breed	Av. lbs. milk	Av. lbs. fat
*Dave Fitzpatrick	Tillamook	25	GJ	9,250	488
*Geo. W. Durrer	Tillamook	24	GG	9,937	452
*Paul Edmunds	Cloverdale	26	GJ&H	9,689	409

Of the 3 high herds of over 12 and under 20 cows, Ernest Leonnig's *17 Guernseys and Jerseys (milked with De Laval Milker) made an average of 9,603 lbs. of milk and 442 lbs. of fat.

Mature Cows Producing Over 575 Pounds

***All cows marked with star were milked by the De Laval Milker.**

Report Shows that High Record Makers Use the De Laval Milker

☞ **All of the high herds of 20 cows or over were milked wi the De Laval Milker.**

☞ **Five out of six of the mature cows producing over 575 lb. of fat were milked with the De Laval Milker.**

☞ **Six out of eight of the 4-year-olds producing over 500 lb. of fat were milked with the De Laval Milker.**

☞ **Five out of ten of the 3-year-olds producing over 400 lb. of fat were milked with the De Laval Milker.**

☞ **Five out of ten of the 2-year-olds producing over 350 lb. of fat were milked with the De Laval Milker.**

☞ **The average production of the 1,306 cows tested duri the year was 8,388 lbs. of milk and 359.39 lbs. of butter-fat.**

Could stronger, more convincing evidence than th be offered of the superiority of the De Laval Milker?

Tillamook County, Ore., has the well-merited repu tation of being one of the finest and most progressiv dairy sections in the world. The fact that De Lava Milkers are aiding its best cows to establish greate records is an argument that should not be overlooke by a single dairyman.

Write to the office listed below that is nearest to yo or ask your local agent for complete informatio concerning the De Laval Milker—truly the "Bette Way of Milking."

TEACHING AGRICULTURE SELF-RELIANCE

D. D. BRUBAKER, MINNESOTA

'HEN I was a kid, our gang used to go down to the old swimming hole every day. We had an unwelcome little snipe, name of Wallie, tagging along us. Wallie's mother had told ot to go near the water as he drown, but he had to go along he rest of the boys or he have died of lonesomeness. of us used to get him to his clothes off with the e that we would teach him m. Then someone would him into the water and ne else would pull him out. would stand on the bank y and put on his clothes, g that we didn't play fair at he would tell his moth- ut he only went far enough o be safe until we started and then he would tag behind again. He couldn't lone, and it was hard ex- with anyone else. Poor had a tough time, and the us hated him.

day it happened that he m were the only ones that d the swimming hole. Sam n to take off his clothes on omise he would teach him n, as this was a good time he rest of the gang were ere, and he could surprise nch tomorrow and he could ll his mother there was no of drowning anymore. Sam threw him in. Wallie ed to struggle out, crying reaming and full of wa- Sam threw him in again gain. He said afterwards e intended to drown the at or make him learn to He did learn to swim that nd before frost came he e first one in and the last t, and turned out the best er in the gang.

agriculture is in a great e same situation that Wal- in. It runs along behind business gang of ours. It cked in as it did in 1920 he government price was off of wheat, or as it does we import cocoanut oil to e with peanut oil and lin- il and butter, or when one invents a refrigerator bring beef from Argen- t is always crying for some- pull it out on the bank where dry off in the sun, before get- cked in again.

dealing with Wallie Farmer g question for the rest of the r. Would it be a good thing agriculture stay in the swim rn to dive and duck like the siness boys, with the possible of drowning, or should we supporting hand under his nd hold him up, say a little nal tariff, or a government equalization fee plank so he could lie on it and splash his arms and legs, without having to learn to swim? Or, would it be better for Uncle Sam to take him over into the shallow water and teach him some of the strokes and help him learn?

C'MON, THE WATER'S FINE

Possibly the answer may be found in the Division of Co-operation, in our U. S. Department of Agriculture at Washington. The law creating the Division of Co-operation gives that body plenty of authority to go ahead with co-operative organization, aid, and advice. All that is needed is the necessary funds. The $500,000 provided for one year's expense in the McNary—Haugen Bill would make a wonderful start in putting a farm marketing program on its feet.

The personnel of the group for doing this work should be the leaders of our present successful co-operatives. This isn't an academic problem or a matter of statistical analysis, but of constructive business procedure. Get the most capable co-operative evangelists in the country. Conscript them if necessary and pay them enough, regardless of what that is. Back them up with the attorneys, accountants, and organizers who have helped build present successful co-operatives. Those men would be better off and we would be immeasurably benefited if they should spend their time and energies for American agriculture as a whole, rather than staying with their well established concerns.

During the development of this great mechanical age, which has been coming on us for the last seventy-five years, the farmer has learned to use the most wonderful set of new tools, and has been supplied, by our agricultural investigators, with the greatest fund of production knowledge the world has ever known. It has made a producing machine of him, while the fellow in town has very obligingly relieved him of the marketing, the money making end of his affairs.

What the farmer needs to do now is take over this marketing, at least to the extent of regulating and stabilizing it. That doesn't mean owning all the elevators, warehouses, creameries, and packing plants in the country. It does mean, however, the control of farm products up to the time of marketing, storage, or shipments and a voice in the determination of prices. This can be done most satisfactorily by farmers owning primary receiving plants. These will have to unite in state associations which in turn must combine nationally.

Legislation like the McNary—Haugen Bill is simply an invitation to dump crops as soon as harvested. It relieves the farmer of any possible voice in marketing and in effect says, "Come on with your crops, your big Uncle Sam with his millions will take care of you." It would be like giving Wallie a plank to paddle around on.

It is going to take a long time to build these national co-operative marketing concerns. It means saving m o n e y, training men, making some mistakes and correcting them. It is going to cost a lot in money and brains. Everything does. What do you think it will cost if something isn't done to improve the farmers' financial condition? If our efficient production and uncontrolled marketing continue to run wild, they will wipe the American farmer out of existence. Then we can pay some other race of men, some other nation for the raw material we use.

That statement doesn't need a livid scare head, because agriculture isn't going out of business all at once in the near future, but if farmers can't make a decent living we are going to have a declining agriculture, and you can do your own guessing about the cost of that. Co-operation is on the way. You can't stop it.

It was late when Pat reached home. Not wishing to disturb his wife, he crept in on his hands and knees, but Fate intervened. He struck the bedpost. His wife, sleepily, putting out her hand, touched his head, and thinking it was the dog, began patting it. In telling this story, Pat said: "And the saints be praised! I had the presence of mind to lick her hand."

LIFE AND WORK OF T. L. HAECKER

Biography

[Theophilus Levi Haecker, professor emeritus of dairying at the University of Minnesota since 1918, and now 81 years old, is known as the father of dairying in the Gopher State. His pioneer efforts for co-operation in the dairy industry are well known.

He was born in a little log cabin in Medina County, Ohio, the fourth child in a family of twelve, on May 4, 1846. In the autumn of 1853 the Haecker family moved to Wisconsin where they settled on a farm at Cottage Grove. Young Haecker attended country school, first in a deserted log cabin, then in a frame building.

In 1860 his father sold the farm and rented another on the east shore of Lake Monona, four miles from Madison. It was in these early days in Wisconsin that young Haecker received his first lessons in dairying—from his mother.

In the autumn of 1863 he entered the University of Wisconsin "in sight of Camp Randall." The following March he enlisted and served his country faithfully throughout the Civil War. This chapter is a personal account of the succeeding period written by Professor Haecker himself. There are four chapters to follow on the life and work of this great dairy investigator.]

No. 1

UPON my return to Madison after the war, I worked a short time harvesting and stacking among our neighbors in Cottage Grove, then joined our family in Franklin County, Iowa, where they had moved while I was in the army. I did farm work, and in the early autumn of 1866 engaged in threshing and ran the machine during the winter, and in March, '67, returned to the Wisconsin University until the fall of 1868. In the winter I taught school and a short term in the summer.

During the years 1871—73, I was engaged in newspaper work and in February, 1874, returned to Cottage Grove and early in March commenced farming on my own account in the immediate neighborhood where father first located.

The farmer who was our nearest neighbor, residing just across the road, had a large farm and no boys, while father had a small farm with boys to spare, so we were often called to help our neighbor, Mr. W. R. Taylor. He had been elected governor of Wisconsin in November, 1873. Saturdays he used to come home and remain over Sunday. One Saturday early in March he sent word to me he wished to see me at his home. I sent word that I was busy but would call on him in the evening. He was a Democrat while we were Republicans and Temperance people. (He generally kept a barrel of Spirits Fermenti in his cellar to cheer his friends.)

When I called on him that Saturday evening, he greeted me heartily. We talked old times over for a while,

THEOPHILUS LEVI HAECKER TODAY

as I had not seen him for nearly a decade. Approaching the object of my call, he remarked, "I know you are a young Shanghai, but I remember when you used to work for me you put everything in its place. You did your work well, were dependable and industrious. I need such a person in my office."

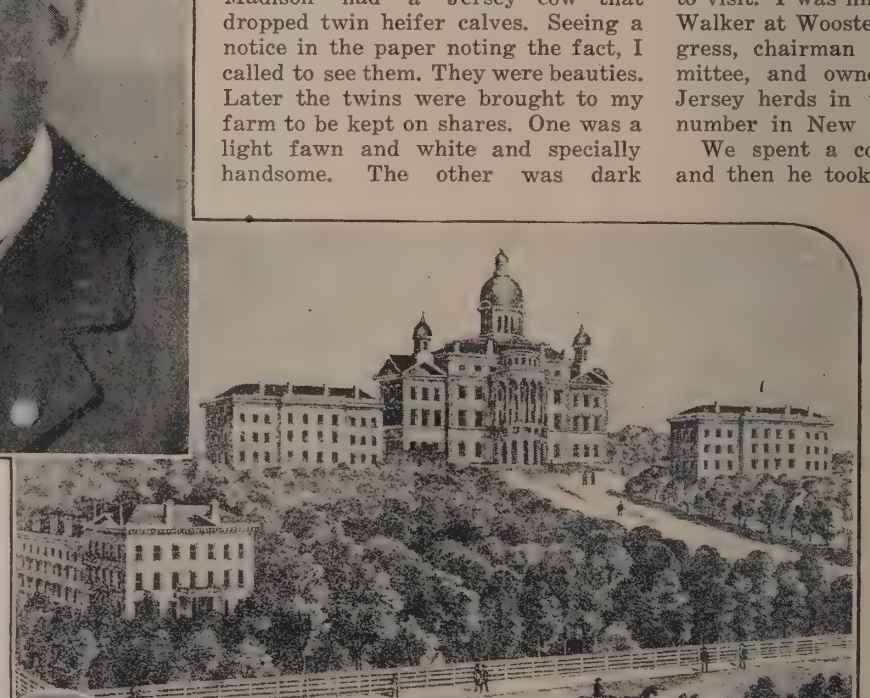
I told the governor that I had made other plans and needed time to consider the proposition. He gave me a week, and the Saturday following I accepted, provided I had a few weeks' time to adjust my affairs. The result was that on May 11, 1874, I reported for duty in the governor's office and retained the position seventeen years, though each succeeding governor had intended another person for that position.

I concluded to continue developing my farming enterprise, as I considered tenure in a political position uncertain. I bought a team of horses, a few cows claimed to be good milking Shorthorns, two good sow pigs, and a few chickens. My father-in-law lived on an adjoining farm and had three boys old enough to do farm work. All three worked for me in turn for years. The cows were disposed of the second year, all but one, and dairy grades substituted.

I gave special attention to making a very high grade of butter by the gravity Cooley can process, improving the herd, and providing comfortable housing. A business man in Madison had a Jersey cow that dropped twin heifer calves. Seeing a notice in the paper noting the fact, I called to see them. They were beauties. Later the twins were brought to my farm to be kept on shares. One was a light fawn and white and specially handsome. The other was dark orange, fawn and white, a little pot-bellied, cat-hammed, and ewe-necked. They were exhibited at two fairs and the former took first prize each time as yearling and two-year-old. Flora, the former, was very refined, had level top and bottom lines and carried considerable flesh, while the latter, Ruby, was spare, sway-backed, and plain looking. In time she became the most profitable cow in the herd, both as a breeder and producer, while Flora was a shy breeder and poor producer. Yet she was always admired by visitors to the farm. Ruby was in the herd eighteen years, gave us three pairs of twins, and was carrying a pair when she was fatally hooked by a Guernsey.

By this time the Silver Spring Dairy had become noted; the state officials, judges of the supreme court, and prominent citizens of Madis ing supplied weekly by the Jerse ter from our dairy.

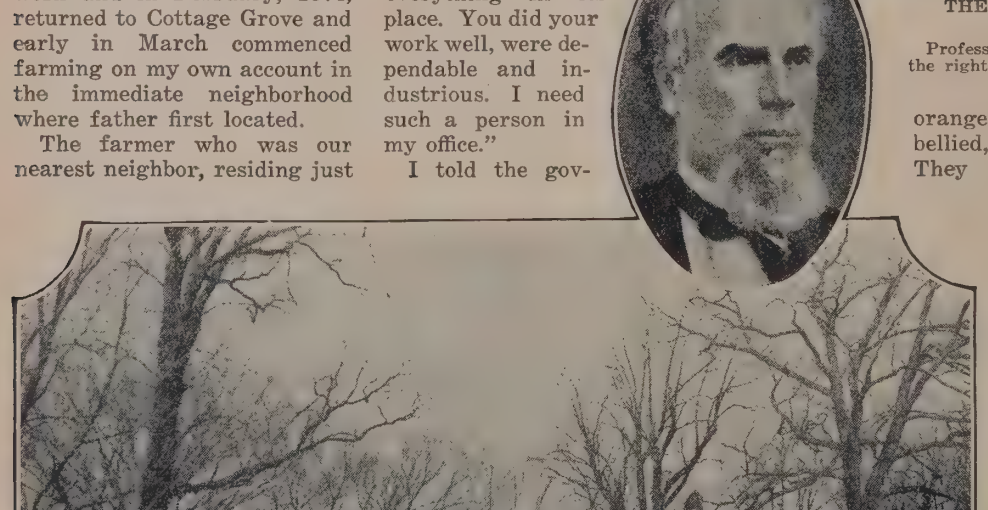
When the Board of Regents University of Wisconsin decid put some full-blooded dairy st the University farm, the exe committee asked the governor would consent to excuse me a of weeks as they wished to secu services in visiting noted dairy with a view of selecting son foundation stock for the Univ dairy herd. In a short time authorized to make a general i tion of some of the best herds i England and to make such pur as I thought advisable and wa vided with certified checks fo purpose.



The breeders certainly treat generously. I first visited the wood Farm, South Framingha Bouditch's. The next morning inspecting the herd, he inform that he was in business in Bost would be away from home most time, but a team and coa would be at my service for the and he suggested several herds to visit. I was finally taken to Walker at Wooster, a member o gress, chairman of the financ mittee, and owner of a num Jersey herds in that section number in New Hampshire.

We spent a couple of days and then he took me to New shire whe had plac number of h among the ers. He show many famou mostly of t sey Belle of ate strain, lier's, and E It was the r structive s had ever se those famo were point especially t uate strain, always ed me of Ruby. I this day, e outstanding these co upon my mi returned to and I proc Milton to dro in his prime; then retu Millwood Farm and bought a of cows, mostly of Scituate sta

The bargain the regents ma me before I left Madison wa might choose one first. Pr Henry was to select as man wanted for the University fa I was to take the rest. I sel two-year-old heifer. Henry or eight, and the balance of t tion proved very satisfactory two-year-old heifer chos proved the best in the lot.



Every milking of all t was weighed on my fa a churning of one week's mi was made in the middle f quarter; and when the he completed her third quart formed Professor Henry that going to do better than 50 butter in the year. He cou lieve it. I said he might have ing the balance of the year fy himself. I sent her to t with the proviso that she m good pasture, light, grain ra not be turned out with the ot

IVE YEARS OF DAIRY FARM BOOKKEEPING

CLAUDE H. HORMEL, IOWA

OTE your request for farm busi-ness statements and I am pleased o give a complete summary of cost accounts of Sunnydale Stock from Feb. 1, 1922, when I d farming, to Feb. 1, 1927, when completed five years of records. urse we balance the books and up a statement at the end of

JARTETTE OF 400-LB. COWS IN THE SUNNYDALE HERD

ear's business but we find this ary covering five years' busi-ery interesting and even more le as a basis of comparison ny single year's report. It has dvantage of striking an aver-etween high and low prices on e different enterprises on the as well as good and poor sea-ith the crops.

operate a 240-acre farm main-g an average herd of 40 head of Guernseys, half of which are, ule, in milk and the balance stock. We raise and market an-150 to 200 head of hogs. two live stock enterprises con-ractically all of the feed raised farm and in turn practically the feed is raised. The past ears since getting our rota-established we employed sweet for pasture, alfalfa for hay g pasture, soy beans for emer-hay crop, as well as protein nent for the other grains fed s and cows. Corn, oats, and comprise the other feed crops

past three years of the 5-year we have kept daily milk rec-ords, tested for butterfat monthly, and kept complete feed and production records on each cow in the herd. The first year these records were kept the herd showed an average annual production per cow of 293 lbs. fat. The third year ended with an average annual production per cow of 369 lbs. fat. Furthermore, the feed cost per pound fat was reduced from 22.2c for the first year of records down to 18.5c for the third year. It was necessary to do this work ourselves as there is no C. T. A. in the community. Just as the testing records for the last three years show marked improvement in the dairy enterprise of the farm, so the complete cost accounts have shown improvement in the farm business as a whole with each new annual statement. In fact the net profit for the last year of the five was nearly double that for the first year, although the crop season was hardly as satisfactory.

A brief resume of our system of accounting will no doubt be a desirable preface to the statements that follow. An annual inventory is the first essential and must be done both conservatively and consistently one year with another so as to guard against temporary inflations which might only cause one year to show a large profit and the following year a large loss. Our farm which is highly improved with large barns, silo, electricity, and water system has always been inventoried at $60,000. The average inventory for feed, stock, and equipment runs at about $8,000. Accounts are kept with each crop and stock enterprise on the farm as well as cash, interest, manure, labor, equipment, and general farm account. Each cash or trade transaction on the farm thus requires a double entry on the books. Likewise record of hours of labor spent with each enterprise is kept at all times.

This no doubt sounds very complicated to the person who has never tried it but after five years' experience we find it very simple and we think gives a higher return for effort put forth than anything else we do.

What follows now is our general summary for the past five years:

Live Stock Account

Dairy Cattle: An average herd of 17 cows and young stock maintained.

During the period 25,423.5 lbs. fat were sold at an average price of 43½c per pound. The total feed cost for the cows producing this fat was $6,988.73, or 23½c per pound fat. Note here that we were evidently producing fat at a much higher cost before we started keeping production records on our cows which showed the cost of production cheaper for the last 3 years. The cash return for $1 spent in feed on the entire dairy herd was $1.91.

The total net profit over all expenses for the 5 years was $1,767.22 or an average annual net return of $353.25. Expenses include all feed, labor which amounts to about $750 annually, annual charges for following of about: Interest, $175; building rental, $200; veterinary, insurance, etc., $200.

Hogs: During the first three years of the five, hog production showed a loss and all the profit recorded plus recuperation for the losses of the first three years was made in the last two years. This is due to observance of sanitary methods the last two years along with good hog prices and cheap corn. During the period, 720 head of hogs were sold for a total of $14,811.58. The returns per $1 expended in feed were $1.48; total net profit for 5-year period $1,773.06, or an annual net return of $354.61.

Poultry: An average flock of 150 hens has been maintained, returning an annual net profit over all expenses of $105.38.

Farm Crops

Practically all farm crops are fed on the farm; in fact, as an average over the 5 years more feeds have been bought than sold. All crops are sold to the stock at prevailing market prices.

Corn: An average of 15 acres of corn goes in the silo each year and with the exception of the final net profit, is not included in the figures

(Continued on page 709)

A Dairy Herd for a Purpose

F. F. GILMORE, KENTUCKY

SUPERINTENDENT GEORGE COLVIN AND CHAS. TACHAU (RIGHT), MEMBER OF THE BOARD AND RESPONSIBLE FOR THE PURE-BREDS

"Every child a healthy child, and every child a happy child."

THE Louisville and Jefferson County Children's Home is a child caring and child placing institution. It is owned and supported by the city and county and is situated at Ormsby station, 12 miles from Louisville, Kentucky. It is a farm of 400 acres of good land, well watered, all tillable but 120 acres of pasture. One interesting point about these pastures is that the liquid manure from the dairy barn is distributed on them with a tank sprinkler. Part of the farm is given to gardens, orchards, corn for silage, oats for hay, cowpeas, soy beans, and alfalfa. Ninety acres are kept in legumes with about half of this being turned under for soil betterment.

The Home grounds, with four girls' cottages, seven boys' cottages, and the one for colored boys, superintendent's home, school and service buildings, lawns, recreation grounds, and dairy barn take up many acres.

Formerly the institution was within the city of Louisville and the delinquent children were hedged around by a wall, really a juvenile penitentiary. During those years the run-a-ways averaged thirty a month. Now, under Superintendent George Colvin, on this large farm with no baracades, the escapes do not run twelve a year.

A Home, Not a Penal Institution

The boys and girls in this Home, averaging 450, are sent here by the Juvenile Court. They can be kept until they are 21 years old, but few of them are kept so long, as foster homes are found for many and others are sent to work-homes where the Home pays their board. Some of the bright boys and girls are sent to high school and a few to the university, the Home paying their expense. Supervision is maintained over them wherever placed. Every child in the Home attends the graded school, which is conducted equal to the city schools, the teachers being college graduates. A visit among the boys and girls at school verifies the Home motto, "Every Child a Healthy Child and Every Child a Happy Child." All children have their hours of work, study, and recreation.

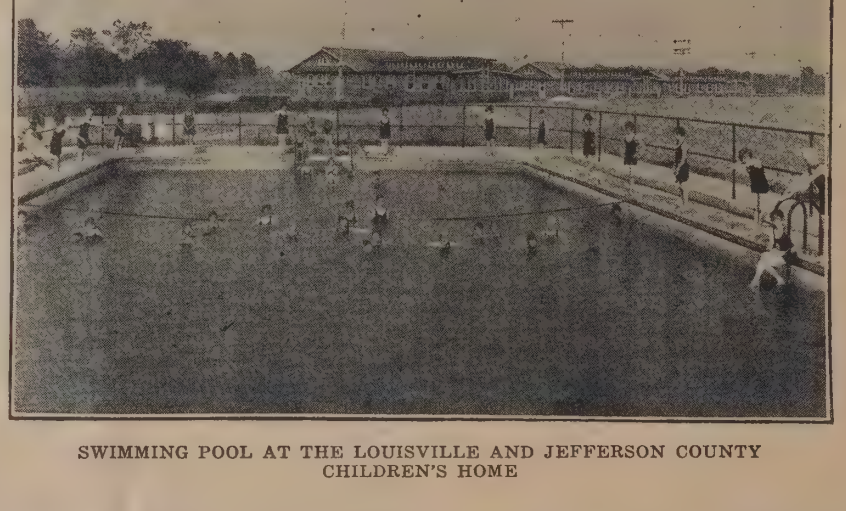
In addition to the regular academic subjects, agriculture and manual training are taught the boys and domestic science to the girls. Several industries are carried on the campus, and there is a close relation between the work done in the shops and the subjects taught in the school. All the children get instruction in music, either vocal or instrumental.

Pure Milk is the Foundation of Health

When the superintendent was asked what was the foundation of the health of his children he replied, "pure, fresh milk." After showing me through the service buildings where the kitchen, bake shop, store rooms, dining room, and cold storage room were, he said: "Now let's go over to the dairy barn." The barn has a gambrel roof, is 133 feet long by 36 feet wide, with concrete floors, troughs, and gutters, and is equipped with steel stanchions and drinking cups, with stalls for 40 cows having cork brick under foot. The building is well lighted and has King ventilation. It is electric lighted, and the barn, like every building on the place, has a complete sprinkler system. This was put in that in case of fire the flames would be retarded so that the valuable cows could be gotten out. The herd of cows in milk number 38, all are registered except about seven and they will be replaced as soon as young stock comes in.

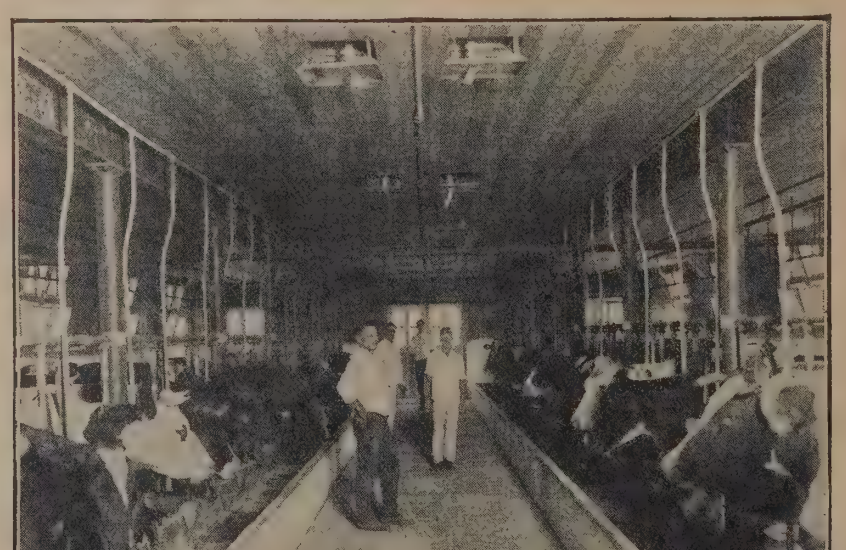
The average production is 100 gallons a day. The milk of each cow is weighed and a record kept of every one. It is then taken to the milk room, aerated, and cooled and sent over to the service building. The milking is done by seven of the older boys under a trained dairyman. The liquid manure is drained off through underground pipes to a tank down the hill, 75 yards away. The solid manure is taken out by carriers to a shed 50 feet from the barn. The cows are kept well groomed.

Two 100-ton silos furnish the silage the year round. The hay, consisting of alfalfa, oats cut green, clover, and soy beans, is thrown down from the loft. Concentrated feed is composed of ground corn and oats, linseed and cottonseed meal, and fed after the formula of the College of Agriculture. Professor J. J. Hooper visits the Home dairy regularly and now has four cows under official test.



The herd bull is a twin, Segis Butter Boy, by King Segis Pontiac. This aged bull is considered the best bred in the state. His heifers, some being in milk, are great performers and his young bulls sell readily.

When asked why the Home goes in for registered cattle, the Superintendent replied, "Charles Tachau, a business man of Louisville and a member of the Board, is a graduate of Wisconsin, had a fine dairy herd, sold out and served in the war, loves good cows, and this herd and dairy are his pet—and he is making a great success of it. Mr. Tachau is a genius for registered cattle and production."



The barn has four maternity pens, one calf pen for eight, and a bull pen. The barn is spotlessly clean. The boys in the dairy are credited with regular wages according to hours of work and, when released, are fitted to enter any dairy and have some money saved up. About a half dozen healthy young dairymen are turned out each year, every one going to the country. Professor Colvin says there is no better vocational training than through the dairy.

On the grounds is a concrete wading pool for little children and a sanitary swimming pool for the larger ones, 80 by 40 feet, costing $12,000. Filtered water is piped out from the city, and for pressure a stand pipe and tank stands 108 feet high, which supplies every building on the farm.

Professor George Colvin, the superintendent, is a highly educated man, was superintendent of education of the state for four years it is a pleasure to see the bo lute him and hail him as a f He calls these hundreds of boy girls his children. He has just selected as president of the U sity of Kentucky.

Seasonable Live Stock Notes

VE know how hard it is to persuade a farmer to steal time from grain harvesting to look live stock. There is only one real time to put a crop of oats, barley, heat in the shock and that is when just ripe enough and not too Besides cutting grain when it is y, there is corn to be laid by and e some late hay to be cut. Some- s the second cutting of alfalfa s a bid for attention. With all of there are a few things concern- ive stock that may need atten- They could be done early in the oon when it is frequently too o get into the field. They could ne if one thinks of them.

Flies

iry cows are unusually respon- o comfortable surroundings. We no comprehensive data to prove cows well protected from flies give more milk than the same would when continually pestered flies, but we are strongly in- l to the opinion that the thor- use of a good fly spray is not good business but also a good to even the temper of the man does the milking. Who wants to cows made restless by a few and flies?

Shade for Calves

are told that direct sunshine is ent stimulus in the growth of animals and poultry. Too much e direct scorching kind of sunshine does not seem to be exactly the right thing to subject dairy calves to and this suggests shade for them during July and August. Again, as with the flies on cows, we do not have experimental data proving that calves subjected all day to scorching sunshine are seriously damaged but we judge calves just a little by what we would tend to do on a hot day if we had opportunity. We would lean toward the shade and we are convinced that dairy calves should have shade provided.

Must Help Hogs Keep Cool

The hog has a poor way to regulate its body temperature. At least we can say it is rather slow acting and many a hog owner can testify to the costs of hurrying a fat hog in hot weather. The main reason the hog may have some difficulty in meeting emergencies that affect body temperature is that it has very few sweat glands. When exercise is set up in the body heat is generated. The horse, in order to dispose of surplus heat, perspires profusely and the breathing is more rapid. Heat is carried to the surface and there discharged from the body through these processes. The hog, having very few sweat glands, can only discharge surplus heat through water or vapor expelled at the mouth and nose. It is, therefore, important to provide shade and water for hogs in hot weather. Caution must also be exercised in moving fat hogs to market as also in driving them about on the farm.

Watch the Radiator of the Horse

While we are on the subject of sweat glands a word of caution needs to be sounded concerning horses at heavy work in hot weather. Everyone knows that if the fan belt breaks or goes off on the tractor or if the water runs low in the radiator the engine will soon become too hot to operate. Sweat glands are a part of the cooling system of the horse—the radiator, so to speak. If for any reason this cooling system ceases to function on hot days when horses are being pushed right along there is grave danger of serious damage to the engine. The neighborhood gossip will have a new subject to talk about and it will sound about like the following: "Jim Jones lost a good horse yesterday from the heat." On hot days as long as horses are sweating profusely they are getting rid of the excess heat generated by exercise but when the hair dries it's time to think about pulling for the shade.

To Control Lice in Poultry

Two weeks ago we said something in this column about culling poultry in July. It may be that some are moved to action by our suggestion. In this issue we take up the subject of treating poultry for lice at the time the flock is being culled. The writer knows from the experience of having culled many flocks in July that lice are frequently encountered and that the treatment for lice is easily applied as the birds are handled in the culling examination. Two very good preparations are here suggested. The cull hens that are to be sold immediately need not be treated. For the hens that are to be retained in the flock, before each is released after examination dust a pinch of sodium fluoride under each wing and around the vent. Another good louse killer is made from two-thirds blue ointment mixed thoroughly with one-third vaseline. Rub an amount of this mixture the size of a garden pea thoroughly into the area beneath the vent.

The Surge Milker
Pine Tree Milking Machine Co.

The Only Milker that

1 *gives the cow's teat the Real TUG of the calf—*
2 *and like the calf—TUGS harder and harder as the cow milks out—*
3 *and like the calf—gives EACH cow just the TUG she needs!*

Milks Like a Calf!

The Surge Milker does MORE than other milkers. The Surge *finishes* the job; other milkers only start it. Other milkers secure the milk by suction; some add a release or massaging action. The Surge does both! And then ADDS *The Real Tug of the Calf!* Yes, and like the calf—The Surge TUGS harder and harder as the cow milks out. AND—a quick, easy Surge Adjustment enables YOU to give *each* cow just the suck and TUG she needs to get ALL the milk. No other milker does or can do ALL THIS—which accounts for The Surge's well known ability to milk cows like no other machine has ever milked cows before.

6 Milkings FREE!

Right in Your Own Barn — With No Obligation to Buy

Mail coupon now for details of our amazing FREE Offer which gives you a chance to prove ALL THIS in your own barn, on your own cows—for 6 milkings FREE—and without the slightest obligation to buy! We also want you to see The Surge Milker milk out "that cow" you're ready now to bet can't be milked by machine. Our attractive price and Easy Terms will be another Surge feature you'll like.

Easy Terms
You can buy a Surge Milker on very easy terms. We'll figure to use any equipment you may have already in your barn. You'll be surprised how little it'll amount to. Mail coupon Now. It doesn't obligate you.

Mail Coupon for Free Book

We have just issued a NEW Surge catalog that tells you MORE about milking and milking machines than anything you've ever read. It's a very valuable book for any farmer milking cows to have. This coupon will bring it to you—FREE.

Mail It Today SURE!

A Toast to the Cow

The cow is a wonderful creature,
No other to man more worth while.
To serve, her life's work,
No intentions to shirk
Show in her honest old face without guile.

As an artist, no coloratura,
Her voice has a quality strange,
A liquid contralto,
Or sweet, limpid alto,
But shows a sad lacking in range.

Her tail has a joint universal,
To hasten departure of flies.
Of stomachs she's four,
The one on the ground floor
Is a cache for lunch. She is wise.

Her "Home Brew" is life to the infant,
It's health, growth, and strength to the lad.
As a "bracer" for father
And a "night cap" for mother,
A "kick" but no "kick back" is had.

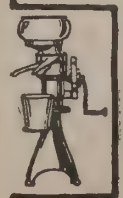
For the girls it is nature's cosmetic,
A "School Girl Complexion" ensures,
When applied from within,
Nature's beauty they win,
A beauty entrancing to wooers.

Her "here" is a life filled with service,
Her "hereafter" a fate oft deplored.
She serves man on earth,
From the day of his birth
Yet a "filler" for hash, her reward.

Then a toast to the world's Foster Mother.
With her own "brew" that Volstead won't ban,
Let us now glasses fill
And drink with a will
To God's richest blessing to man.

Arkansas. W. H. Woodley.

Mike: "Phwat are cranberries?"



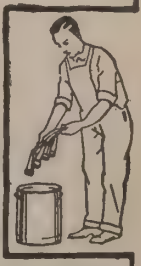
Pat: "Cranberries? Don't you know what they are?"

Mike: "Yis, but do you?"

Pat: "Cranberries are like watermelons, neither fruit nor vegetables; but if you cook them they make better applesauce than whut prunes does."

Keeping Milk Sweet with the aid of B-K Rinse

Keeping milk sweet means preventing bacterial growth. 85% of such bacteria result from contact with non-sterile utensils and cans. 95% can be destroyed by just using the cheap, quick B-K final rinse. Send for our milk can bulletin 928.



Separators

Every part touched by milk is coated by an invisible film of casein and other matter on which germs breed, and which ordinary washing does not remove. B-K dissolves the film and destroys 95% of the bacteria. Send for our separator bulletin 112.

Milking Machines

After each milking, wash milking machine parts and keep in dilution of B-K and water. Then to prevent possible spread of infection from cow to cow while milking, rinse cups and tubes in a pail of B-K dilution after milking *each cow.*

Send for our milking machine bulletin 124

Wayside Musings — Old Fashioned Religi

JOSEPH S. MORRIS, WISCONSIN

ONE often hears people express the wish that we might return to the old fashioned religion. Was there something in the old fashioned religion that is lacking in the religion of today or is there something lacking in us that was present in men and women of other days? I am inclined to think that the lack is in us.

The purpose of religion is the interpretation of the meanings of things. Much new knowledge has been added to our human store of knowledge and it is possible that this new knowledge has sometimes been confusing. Our confusion is due to confusing what we know with what we believe.

In our faith, as in the faith of our fathers and our grandfathers, there is and was the confidence that our world is a world in which there is present everywhere the spirit and power of God. Our fathers were no more capable of answering all questions and solving all problems than are we. Indeed there may be some questions that we can answer and some problems that have been solved in our day that were impossible to them. Faith doesn't wait for the solution of every problem and the answer to every question. If it did there would be no faith.

The temper and spirit of our age is expressed in fullest and freest investigation everywhere. To the man of a living faith there can be no fears nor misgivings. This is God's world! No fact, no truth, discoverable in this world of God's can possibly do us harm. The only thing we need to fear is that men may attempt to make half truths whole truths; may attempt to make the partial seem complete. Truth and fact in this world of God we need not fear.

There was manifested in old fashioned religion an intensity, a sincerity, an enthusiasm, and an abiding satisfaction that many people say they cannot feel in their religion today. They long for the old fashioned religion and yet they have that religion today, minus the qualities of enthusiasm and intensity. Perhaps the way out is to find the way to that very enthusiasm that is lacking.

God was very real to our fathers, to the men and women of other days. They felt that they could talk with God and that God could talk with men. They were afraid that wrong living would break their communion with God and bring them punishment. Their lives were aglow with enthusiastic faith in Jesus. Sunday was a great day to them. The church was a city set on a hill, toward which all the days of the week pointed. They were sure that the Spirit of God was with them every day. In many respects their faith was simple, beautiful, and satisfying. In i there was a great comfort.

Let us be reminded that the fashioned religion was what it in the lives of the believers be they made the venture of faith. find the enthusiasm, the sincerity intensity, and the abiding satisfa that we desire, we too shall ha make the venture of faith. We have to start right where we with what we know, and what w and what we hope, and go on there.

We shall, in our day, if we wise, submit many questions problems to their appropriate p in the exact sciences. Reli business is to give an answer t meaning of it all, to find caus hope, and optimism, and courag bring comfort to the human l We still have the God of th fashioned religion.

We know, as men never kne fore, the consequences of the tion of Divine laws, all laws. know that the centering of a li a great affection for a heroic pe age such as Jesus results in the ing out of low motives and th throning of high and holy moti

We have knowledge that the is an orderly world; that law i versal; that man's way to things is to discover the laws being and obey them. Ther laws of religion, laws of biology of chemistry, laws everywhere call for men's obedience if they be happy.

We still have need for a re tive power that redeems us fro sins of sordidness and brutis and low aim, and lifts us up to er and nobler ways of life.

We do not gain very much b ing notice of the failures and takes of other men. Our best parisons are always the compa upward rather than downward very people whom we term hyp may be more keenly consci their failures than we are. P the way back to the best fashioned religion is to begin where we are to make use things that will help us tow enthusiastic religious life.

We need knowledge, and fait prayers, and the use of religiou ature, and the habit of worshi the performance of brotherly and love for little childre respect for the mothers of th and a clean thought about our to create life; we need poetr music, and pictures, and th things of art to build our These are all here, ready at Begin right where we are. Us is available. Satisfying religi matter of growth and develo

SOME OF THE FYFFE-WAY CALVES OUT FOR A MARCH SUNNING AT OHIO STATE UNIVERSITY

News From Washington, D. C.

[Special to Hoard's Dairyman.]

Washington, D. C., June 25—The eau of Dairy Industry, co-operat- with the various dairy state au- ities under whose jurisdiction the l cow testing work is being done, rging as careful and complete t as possible this year on the ven sire" projects. J. C. Mc- ell is in charge of this work. e leaders are urged to see that cow testing association report at one proven sire. This means at least one sire having five hters on test from five dams, of h there is an authentic milk and erfat production record, be re- d so that the record of the five hters can be compared with the d of the five dams, and results own to indicate whether the sire ences production up or down. rds were shown at the recent pilgrimage to indicate that the ionship in blood lines between and dam had very little to do fixing inheritance for high pro- on but that mating animals with production records was a pretty in way of fixing high producing itance. The trouble is that the must be better than the dam in heritance characteristics in order ake this work. Hence the cam- for proven sires. Should the be reached this year, of one n sire from each cow testing iation, a good start would be toward building up a list of n sires in the dairy states.

little flurry has been caused g those interested in butter stor- y the story sent out recently Washington, raising a question the stability of the 12 cent but- tariff. Should this tariff be out, it is felt that enough for- utter might be imported in the r to seriously affect the profits cold storage deal. Such a pos- y was said to be involved in the l to the U. S. Supreme Court in -called Hampton case, involving onstitutionality of the Flexible Act, questioned in this case by up of importers in New York Since the publication of the your correspondent has made quiry to find out how quickly ase may be decided, and finds t is not expected, by the De- ent of Justice, that the case e heard before the first of January. This precludes any ffect on this winter's storage y any change in tariff rates this case. It is most likely e decision will be handed down oner than March 1, 1928. The tment of Justice holds that the constitutional and has won a n in each of the lower courts.

effort to secure more adequate ition for agricultural research l up last month by rep- atives of farm and other zations here, a late devel- t being a conference with Sec- of Agriculture Jardine, led by r Gray of the Farm Bureau ed Brenckman of The Grange rticipated in by representatives or twelve other organizations ng the American Dairy Feder- The secretary was told that eturn of agricultural prosperi- be definitely helped by practi- thods for the elimination of and loss in every phase of ag- ral production and market- nd he was asked to give his al to a new, enlarged, and ag- e program of research for urposes. Since this large rep- resentation of organizations placed their request before the President several weeks ago, there has been a notable increase in interest and effort to get proper provision made for research work in the Department.

The capable shoulders of Dr. John R. Mohler, Chief of the Bureau of Animal Industry, received another and very substantial load, effective July 1, when the Packer and Stock Yard Administration is abolished and all of the work of administering the Packer and Stock Yards Act is transferred to the Bureau of Animal Industry. Officers and employees of the P. & S. Administration become a part of the Bureau of Animal Industry by this change. There are some good reasons for the change, as the great bulk of the experience of the department in dealing with and handling the problems of marketing live stock had previously been in the B. A. I. Dr. Mohler, however, has a tremendous load to carry, and it may be wondered if the new duties will serve to distract his attention from other no less important ones, specifically the eradication of bovine tuberculosis. This change, however, is in a direction which many have been advocating, toward the organization of the Department in industry bureaus, along industry lines. It also calls attention again to the large volume of regulatory and service work in the Bureau, as compared with research work, for which the Department was primarily instituted.

Colored Woman: "Doctah, Ah's come to see ef yo am gwine order Rastus one o' dem mustard plasters ag'in today?"

Doctor: "I think perhaps he better have one more."

Colored Woman: "Well, he says to ax yo' kin he have a slice o' hame wid it, 'count of it's a mighty pow'fui perscription to take alone."

ESTABLISHED REX 1896

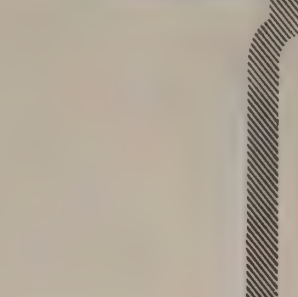
Here Is The Answer to Hundreds of Questions

The famous qualities of FLY-TOX and RAT-TOX and Rex Agricultural Insecticides have brought persistent demands for a *thoroughly scientific* animal spray.

Here it is . . . STOCKAID . . . a typical Rex product. Has all the qualities of an ideal spray . . . pleasant odor . . . stainless . . will not burn, blister or irritate the hide.

STOCKAID does not taint milk.

This animal spray serves a *two-fold purpose.* It *kills* flies, mosquitoes, lice and fleas. STOCKAID *also repels flies,* mosquitoes, lice and fleas. As a repellant, it proves effective from 6 to 8 hours according to amount sprayed and atmospheric conditions. STOCKAID is fatal only to insects. It is harmless to mankind and animals. It is non-poisonous. Animals may lick hide after STOCKAID has been sprayed without harmful results.



It does not gum the hair—this marvelous spray leaves the coat fine and glossy. Does not clog the sprayer.

Like all Rex products, STOCKAID is backed by a money-back guarantee to kill and repel insects. Those who have used Rex insecticides and fungicides need no urging to try STOCKAID . . . the mere announcement of an animal spray developed by Rex, produced by Rex and backed by Rex, is sufficient.

Your retailer sells Stockaid.

"Trade in"

For a Power-Equipped Sharples SEPARATOR

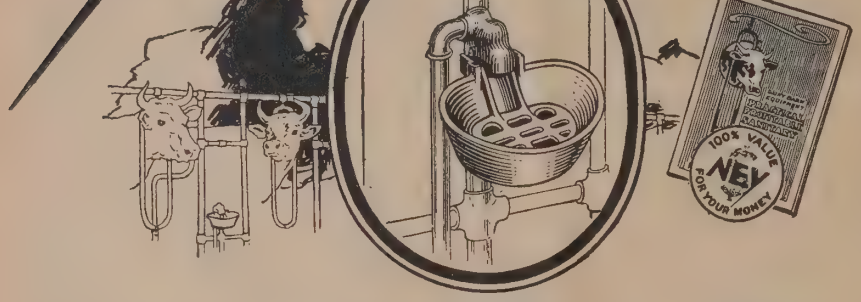
You can trade in your old separator for a power-driven Sharples Tubular—you can trade it in on one of **larger capacity,** at very little cost. A power-driven separator costs only a little more than a hand-driven separator, and $20 allowance will be made on your old machine. If your separator is too small for your needs, if it is worn, out of balance and losing cream, if you value the time you spend every day turning it by hand and want to be free from the drudgery of it all, write today for the Sharples offer, telling us what capacity you need.

$20 allowance on your old Separator

SHARPLES SEPARATOR CO., Dept. N, West Chester, Pa.

When buying mention Hoard's Dairyman to your merchant or dealer—it helps us!

NEY



Help Your Cows Earn You More Profits

TO help your cows produce more milk, richer milk—and bigger milk profits for you—these three factors are most important:

1. Good water
2. Good housing
3. Sanitary dairy barn equipment.

Ney Water Bowls and other Dairy Barn Equipment has aided thousands of farmers the country over in getting more milk and richer milk from their cows. These satisfied farmers paid for their equipment in a few months time from the added milk-profits they received.

Save time and labor in keeping your dairy barn clean by installing Ney Equipment. Sold by reputable dealers everywhere. Write us today for your copy of the Ney Catalog No. 54 and name of dealer ready to serve you.

THE NEY MANUFACTURING COMPANY . CANTON, OHIO
Established 1879 *Minneapolis, Minn ; Council Bluffs, Iowa* Established 1879

Complete Dairy Barn Equipment including stalls, stanchions, water bowls, pens, litter carriers, "King" ventilators, etc.
Complete line of Haying tools including hay carriers, hay forks, hay knives, etc.

Milk Keeps Longer when cooled with the CP Conical Cooler and Aerator

THIS practical Cooler and Aerator cools the milk in one minute, prevents growth of bacteria and removes all stable and other odors. The milk or cream is poured in at the top through a gauze strainer and it comes out a minute later at a low temperature.

The U. S. Department of Agriculture recommends that milk be cooled quickly, as milk cooled as fast as milked keeps sweet longer and gives a bigger cream line.

The *CP* CONICAL COOLER is substantially made. Uses ice or running water — as easily cleaned as a common milk pail.

Remarkable Production

The Ionia—Belding Cow Testing Association of Michigan has completed three years of testing activities. The cow tester, Jens Hansen, who has served this association for the greater share of the three years, reports that the 389 cows averaged 8,991 lbs. milk and 351 lbs. fat.

The feature of this year's testing is the remarkable production record established by the pure-bred Holstein herd owned by the Michigan Reformatory. The 51.6 cow years reported in this herd averaged 15,023 lbs. milk and 501.4 lbs. butterfat.

During 1926 all members fed grain with pasture except two. The reports that the grain ration balanced during the year ac to the roughages on hand a production of the cows.

All members except two hav Six of the members have d cups and three members mad first seedings of alfalfa thi Every member either owns or pure-bred sire. During the year 54 cows were sold as un ble and unprofitable cows. were 51 cows sold for breedi poses. Sixteen new pure-bre were purchased by the meml gether with 37 other grade

A. C. BALZER, Michigan.

THE ALLENTON—KOHLSVILLE ASSOCIATION

Thirty-one Wisconsin cow testing associations reported an average production o 300 pounds fat per cow in 1926. The Allenton—Kohlsville Association headed t with an average of 10,344 pounds milk containing 372 pounds fat. The herds i association are relatively small, are well selected for production, and are adequat and cared for. The members average seven acres in alfalfa and all of them feed on pasture. The association started its ninth year on April 1, 1927, with 15 charter members still testing and it has a waiting list of farmers who want to joi

Work With the Tester

HOARD'S DAIRYMAN:—How often you heard similar remarks to one, and what did you think it? "That cow tester of ours is punk. The other day I asked to figure out a grain ration. You t to have seen it! A few pounds is, a few of that, and a lot of thing else. I absolutely know it not have balanced, and most of would have to have bought!" and by these remarks come . Mr. Cow Tester picks up a here, a little there, and finally issing link. It disheartens him. eels that all that he tried to as in vain. Although he grins bears it, it does not heal the d.

w, dear members, before giving uch reports and giving up the esting work, try another method. ose that the first thing in the ing you sit down with your test- d figure out the ration with him ad of leaving it up to him alone. out the cow requirements and find out how near this your nt feed comes. Maybe you are eeding, maybe underfeeding. the tester the price on feeds and d list of what you have on hand. possibly could afford to sell some you have and buy other kinds eds.

ke your own pencil and figure it or yourself along with him. Ask ions concerning your cloudy s. You surely will not begrudge ime spent this way and I be- that you will discover that cow g is not such an idiotic idea if ake the advantage you are pay- or.

WALTER G. KIRKPATRICK, Tester.

o Dairymen Compared

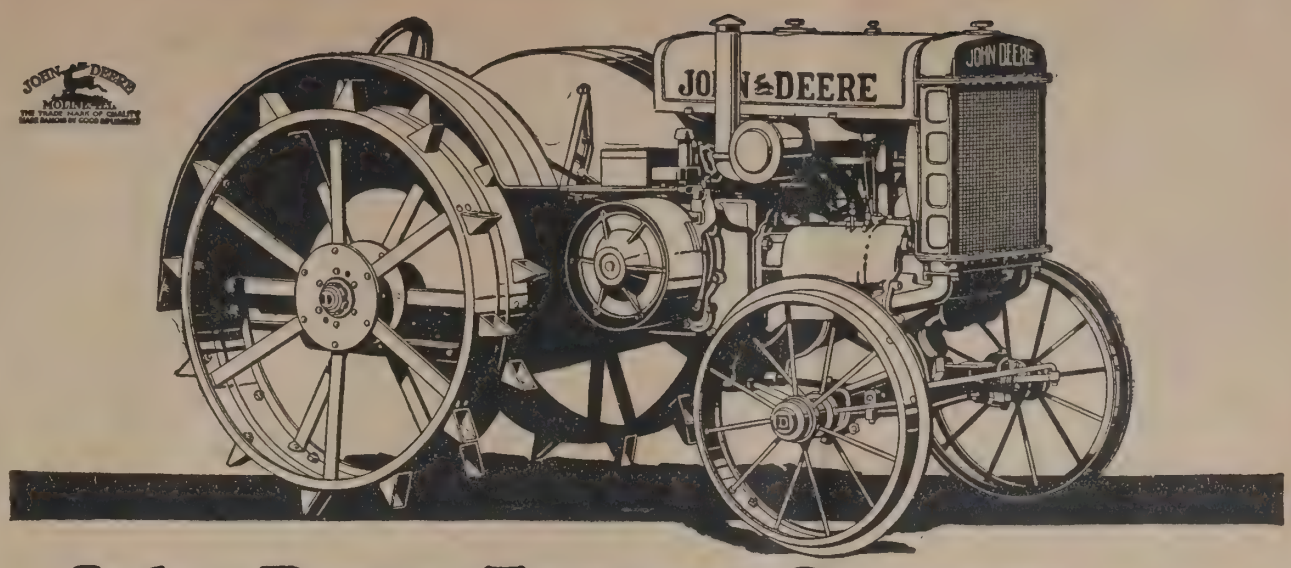
ARD'S DAIRYMAN:—The Den- C. T. A. of Wisconsin com- l the May test work, the aver- ow producing 6.5 lbs. fat more the previous month.

re are figures to help substan- the claim that higher producing are a necessity to insure the st profit. Herd Numbers 1 and e been enrolled in a cow testing ation for five years. Herd No. l 18 cows averaging 303.6 lbs. alued at $161.70. The average ost was $68.82 per cow, leaving profit of $92.88. Herd No. 2 2 cows averaging 408.1 lbs. fat, d at $221.09. The average feed as $76.22 per cow, leaving a net of $144.87 for each cow. Herd exceeded Herd No. 1 by 105.1 at, and an increased profit of er cow for the year. Herd No. rned 55 cents more for every 's worth of feed consumed.

re are some reasons why Herd was superior. The better sires used in Herd No. 2 and for years than in Herd No. 1. Herd has over half pure-bred cows of ancestry and Herd No. 1 con- all grades. Probably better ient was used in the care and g of Herd No. 2, and it found me in a better stable. Owner erd No. 2 was a short course ate, whereas owner of Herd No. not. Owner of Herd No. 2 read farm bulletins and farm papers considerably more than did owner of Herd No. 1. Feeds were of same quality.

MANNING H. NELSON, Tester.

Grain on Spring Pasture



HOARD'S DAIRYMAN:—In the South Newaygo, Michigan, C. T. A., 26 of the 28 members are feeding grain with pasture. One member's excuse for not feeding was that he "ran out of money." But the net returns in his pocket will be much less by fall or by the time another year rolls around than if he had borrowed money to buy the grain. This member's herd has been without grain now for two months. The first month there was very little difference in production compared with the previous month because the grain had only recently been taken away and the cows were taking a reserve off their bodies to hold the milk flow. The second month—May—the production was somewhat lower but due to good pasture it was higher than was expected.

The big difference between the first and second months was the much poorer condition of the cows. The fresh pasture, being largely a stimulant, did not contain enough nutrients for the cows' production so the cows were using the remainder of their reserve body fat to put in the milk pail. When they get all their body fat used up, then they will slump badly in production and it will be at a time when pasture is poorest. Not only will this hurt production and lower profits this summer but all of next winter as well, for the cows will be in no condition to do their best. CLARENCE PRENTICE, Tester.

John Deere Tractor Owners Do Their Work at Less Cost

On thousands of farms this powerful, light-weight John Deere 15-27 Tractor not only solves the farm help problem by doubling and tripling the daily earning capacity of its users, but it also produces farm power at costs surprisingly low.

Mr. W. Larson, of Culbertson, Montana, writes:

"Last spring I plowed and disked 250 acres with my John Deere Tractor at a cost of 67 cents per acre. If that is not cheaper than horses I can't figure, for I know what it costs to feed them. I can plow five acres with my John Deere while my neighbors take care of their 12-horse outfits."

The above is an example of hundreds of letters on file from all agricultural sections, which testify to the economy of this farm-power producer.

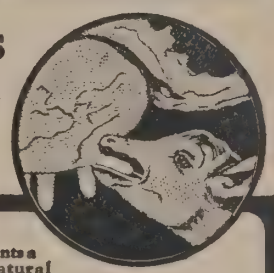
The John Deere produces more power with less weight; does more work with less fuel and oil; gives more years of satisfactory service at lower expense for upkeep and repairs.

The John Deere weighs only 4,000 lbs. There is no excess weight to drag around—to steal power away from the drawbar.

Light weight, extreme simplicity, fewer moving parts, and a specially designed, heavy-duty engine have made possible great power with minimum consumption of fuel and oil.

The sturdy, long-lived working parts of this tractor are completely enclosed in a dust-proof case and operate in a bath of clean oil. There are few adjustments necessary, and you can make them all on the farm. The John Deere is giving its users remarkable service at costs astonishingly low.

The John Deere combines everything you want in a farm tractor—**power, speed, durability, adaptability** and **economy.**



Right near you, at your John Deere dealer's, this real farm tractor is on display. See it. Ask for a demonstration. Have your John Deere dealer prove its merits.

Know What Users Think About Their John Deeres

We will gladly send you, free, a copy of booklet entitled "101 Farmer Judges Write Their Opinions." This is composed of 101 letters taken from the hundreds received from enthusiastic users. The experience of these farmers is worth money to you. We will also send you a folder that tells all about the John Deere Tractor. Write to John Deere, Moline, Ill., and ask for Booklets TW 214.

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Phosphate in Indiana

That Indiana soils respond to phosphate is shown by a summary of soil experiment tests reported by the Indiana Experiment Station. The average of 16 tests running from 3 to 16 years on 7 different types of soil where acid and rock phosphates have been compared shows that acid phosphate costing $3.81 per acre per rotation returned $9.51 per acre per rotation in increased crop values, while rock phosphate produced an increase of $4.98 per acre per rotation at a cost of $4.29. The net profit from acid phosphate has been over eight times as large as that from rock phosphate.

On the Francisco field in 1919, manure alone gave 2,180 lbs. of clover per acre, manure and lime gave 3,740 lbs., while manure, lime, and acid phosphate gave 4,700 lbs.

Better Hay—Less Labor

Better hay and less man labor are the objective of a series of demonstrations now being given in Michigan by the extension service of Michigan State College. We attended one of these demonstrations on the Kalamazoo County Farm on June 17th.

In this issue, we mention briefly the method demonstrated; later, with photographs and more detailed description, we want to tell about "hay day" as it is done in Michigan.

It is not necessary here to explain why better methods of making hay were sought and are now being demonstrated. The interests of our readers are now mainly in "how" can better hay be made with a minimum of man labor. The making of alfalfa hay is chiefly concerned, although the practice applies equally well to other legumes.

The objects are to save the leaves, retain the green color, put the hay in the barn in better condition, and do most of the work with horse or power drawn implements.

The mowing is done in the normal manner. A left-hand side delivery rake is preferred, although a right-hand rake will serve the same purpose. The rake is started immediately or within two hours after the hay is cut and is driven in the same direction as when mowing. Two-swath windrows are made. The object in raking in this manner is to turn a large percentage of the leaves to the inside of the windrow and leave the stems on the outside. Furthermore, if the rake is properly operated, a loose windrow is made, thus getting most of the hay off the ground up where the air can get through. An hour or so before the loader started the rake is driven in the s direction as before, and in a mar to give the windrow a half-turn so that the hay at the bottom of windrow is turned on top.

The curing is all done in the drow. In the case of rain, when weather afterwards becomes fit, windrows are given a half-turn as scribed above. Leave the hay righ the windrow until it is fit to go in barn, turning it with the rake a necessary. In turning the windr always drive in the same direction when mowing and raking the time. In using the loader one dr in the same direction as when rak

We urge our readers to try method, at least in a small way.

Arrangements for this special rate are to be made in advance.—NATHAN KOENIG.

Keeping Bulls from Killing Trees

HOARD'S DAIRYMAN:—At the Kentucky Experiment Station we run our bulls in large grass paddocks. As usual they butt the shade trees in their lots and in summer use the trees for rubbing posts, thus destroying the bark and finally killed many trees. Many suggestions for prevent- this trouble proved worthless. But I found one successful method. I wrapped barbed wire around the trees and the bulls did not molest them further. However, it is well to place a strong post in the lot for the bull to rub against.

Kentucky. J. J. HOOPER.

International 3-ton Truck in the dairy business, owned by Harry Marsh of Carlisle, Ia.

Eighteen farmers at Swift Current, Sask., Canada, are using International Speed Trucks, with grain bodies, as above.

Begin this year to Profit with this Truck

WHEN you come to buy the motor truck that will put your farm hauling on a fast modern basis, remember that INTERNATIONAL HARVESTER *is equipped to help the farmer as no other organization can!*

International Trucks range from the light International, the ¾-ton "Special Delivery," up to the big 5-ton Heavy-Duty unit. They include the most complete line of Speed Trucks on the market, both 4 and 6-cylinder, for 1¼ and 1½-ton loads. If the truck you want is a handy, economical, long-lasting truck for loads of moderate size, one of the Speed Trucks will suit you to a "T."

International in every size is a quality truck—big value at its price. Bodies for every kind of farm load, comfortable riding, with sturdy chassis and ample dependable power for hauling loads over road and field.

Then, SERVICE! You know International Harvester service—it is rendered in fullest measure to International Trucks. We maintain 126 Company-owned Motor Truck Branches and Service Stations in the United States, a wonderful organization of service ready to help any owner meet any emergency. Branches and dealers always close at hand.

Haul your loads four times as fast, do each half-day's hauling in an hour—so you can get back to your fields and livestock where your *profit* is waiting to be made. Let an International help you. *Write us for a Catalog.*

EDITORIAL COMMENT

JERSEYS WANTED IN THE SOUTH

At the annual meeting of the American Jersey Cattle Club a resolution was passed recognizing the heavy loss sustained by Louisiana farmers by the unprecedented flood and the need of live stock to replenish their farms. Many parishes of that state lost their live stock and farmers are deprived of their homes. The American Jersey Cattle Club extended its profound sympathy to the sufferers of this state and assured them of co-operation in helping to rehabilitate the devastated area. The Club appealed to the Jersey breeders throughout the country to contribute both Jersey cows and heifers as a direct means of assisting in a speedy rehabilitation of this flood stricken area. The following men constitute a committee to receive the animals contributed: Professor C. H. Staples, Baton Rouge; A. H. Henderson, Ruston; and W. R. Hirsch, Shreveport, all of Louisiana. The committee has agreed to assume the responsibility of properly distributing the animals in the areas now tick free. The American Jersey Cattle Club earnestly appeals to all Jersey breeders throughout the United States to send to the committee the names of the animal or animals they are willing to give to those who have suffered heavy losses due to the unprecedented flood.

We are pleased to have the opportunity to make this announcement and hope that the Jersey breeders who are financially able will contribute one or more animals to this worthy cause. We can little appreciate the tremendous loss and the severe hardships which the people in the flood area of our country have suffered.

FOR TRUE CO-OPERATION

In his address before the American Institute of Co-operation, W. M. Jardine, Secretary of Agriculture, made a few statements concerning co-operation that should be given more than passing attention. He defines co-operative marketing, as the term is used in agriculture, as marketing by and for the farmers; he gives the essential principles as, first, is it operated solely to render service to the producers at cost and, secondly, is it controlled by the producers?

"Co-operative marketing implies democratic control. An organization is not co-operative if controlled by a few men representing only a minority of the patrons, whether these men are producers or nonproducers. It would not be co-operative if it were controlled by an agency of the government. It would not be co-operative if it were set up and operated by a semi-philanthropic organization."

The secretary further states, "The weakness of an organization set up and operated for the farmers by others involves more than a mere failure to place control in the hands of the men for whom the business is conducted. Whether the business is carried on efficiently or inefficiently, the ultimate effect is to smother rural initiative and self help. On the other hand, what the farmers accomplish through co-operation is a permanent contribution to better farm conditions. In developing their own organizations they gain experience and confidence. In acquiring knowledge of marketing problems, they learn to make needed improvements and adjustments in production. Dependence on the government or on other agencies for direction of so-called co-operative organizations, to my mind, can have but one consequence—deterioration of the business capacity and morale of the producers."

We never expect to see the time when all business of the farm is conducted on a co-operative basis. This is not necessary to make co-operation an effective agent in improving farm conditions. We do not know that it is desirable for agriculture that all farm products be handled co-operatively, but we do know that the products prepared for the market and marketed co-operatively should be done by the producers. The organizations should be formed by them and operated by them. One of the great benefits of co-operation is to teach the producer what the market demands, to give him an understanding of what must be done to meet this demand. No person ever becomes strong unless he has an opportunity to do things. It requires struggle, thinking, planning, and work to become well developed and resourceful. When a co-operative organization is formed upon the right basis, and that means in the hands of the producers, then all these things so desired for human progress follow.

SUNLIGHT AND FRESH AIR

The value of cow testing associations does not lie wholly in determining the production of each cow in the herd; much other information is obtained by those who belong to cow testing associations. The tester in charge comes to the farm once each month and if he is wide awake and observing, he brings information and very often makes suggestions which are most helpful. The contact made between the tester and herd owners is extremely valuable. Notes pertaining to dairy practices gathered by the testers and disseminated by leaflets and otherwise is another way of making cow testing associations valuable. We find in the Iowa Cow Testing Association News the following paragraph written by John Sivesand, tester, which discusses the importance of sunlight and fresh air as factors for growing calves:

"Next to the proper kind of feed, sunlight and fresh air are probably the most important for the growth and health of the calves. Calves kept in reasonably clean quarters, where sunlight and fresh air can get to them, never need to be fed high priced tonics or powders to keep them healthy. Direct sunlight is the best disinfectant in the world. It kills germs, prevents rickets, helps stimulate growth and development. To keep calves healthy and growing—rinse and sun dry all feeding utensils. Milk fed from dirty utensils and also cold and foamy milk causes scours. The milk should be fed while it is warm and with the foam removed. It is a good plan to stanchion the calves when feeding, because it saves time and labor and each calf can be fed its share. A little grain should be fed after each milk feeding."

TOP-DRESSING ALFALFA

"Considerable alfalfa was winter-killed by the long ice covering. The alfalfa that seemed to stand the ice best was that covered by a top-dressing of manure. This covering held the ice up and allowed more air space for the plants."

This quotation is taken from a letter from Clarence Prentice, tester for the South Newaygo Cow Testing Association of Michigan. We quote it for two reasons. First, it does indicate a new practice of safe alfalfa culture; and secondly, it shows how an observant cow tester can carry information to his members that will be of immeasurable value to them. It illustrates one side of cow testing work that has received too little publicity. The good tester is always building better farm practices, and often not directly connected with his work in keeping records on the cows.

Some five years ago we manured an old and partly run-out alfalfa field during the fall and early winter, expecting to plow it up for corn. The following spring saw our new seeding of alfalfa in poor shape and a promise of a short hay crop. We raked off the surplus straw from this old alfalfa field and got a better yield of hay than the previous year. The alfalfa plants grew with new vigor and the June grass grew tall and luscious. This spring we are met with the same condition of the new seeding almost a total loss, and the same alfalfa field again was manured for corn but will be saved for hay.

Many farmers have practiced manuring their clover the year before it is turned under for corn. They report increased yields of clover and as good results with corn as when the corn directly follows the application of the manure without an intervening crop of hay. We would like rep from farmers who may have followed this p tice with alfalfa. It may mean safe and inex sive insurance against shortage of hay follo the occasional winter-killing of alfalfa.

AS IN OTHER DAYS

Delve into the history of people a cen or more ago and we find they had problems struggles the same as we have now. When fessor O. E. Reed of the Michigan College of riculture was in Scotland a year or two ag took occasion to peruse some of the agricultura ports of that country and came upon a letter ten by Robert Burns to his cousin, James Bur The original name of Burns was Burness but changed to Burns. This letter was writte Lochlea, June 21, 1783. The following paragr are taken from it:

"I shall only trouble you with a few partic relative to the wretched state of this country. markets are exceedingly high; oatmeal, 17d 18d, per peck, and not to be got even at that p We have indeed been pretty well supplied quantities of white pease from England and where, but that resource is likely to fail us, what will become of us then, particularly the poorest sort, Heaven only knows. This cou till of late, was flourishing incredibly in the n facture of silk, lawn, and carpet weaving; an are still carrying on a good deal in that way much reduced from what it was. We had also trade in the shoe way, but now entirely ruined hundreds driven to a starving condition on ac of it. Farming is also at a very low ebb wit Our lands, generally speaking, are mounta and barren; and our landholders full of ide farming, gathered from the English and the l ans and other rich soils in Scotland, make lowance for the odds of the quality of land consequently stretch us much beyond what i event we will be found able to pay. We ar much at a loss for want of proper methods i improvements of farming. Necessity compels leave our old schemes, and few of us have o tunities of being well informed in new ones short, my dear sir, since the unfortunate l ning of this American war, and its as unfort conclusion, this country has been, and still i caying very fast. Even in higher life, a cou Ayrshire noblemen and the major part o knights and squires are all insolvent. A mis job of a Dougles, Heron, & Co.'s bank, whi doubt you heard of, has undone numbers of and imitating English and French, and othe eign luxuries and fopperies, has ruined as more. There is a great trade of smuggling c on along our coasts which, however destruct the interests of the kingdom at large, certain riches this corner of it, but too often at t pense of our morals. However, it enables in uals to make, at least for a time, a splendi pearance; but Fortune, as is usual with her she is uncommonly lavish of her favours, is ally even with them at the last; and happy w for numbers of them if she would leave th worse than when she found them.

"My mother sends you a small present cheese; 'tis but a very little one, as our last stock is sold off; but if you could fix on an respondent in Edinburgh or Glasgow, we send you a proper one in the season. Mrs. promises to take the cheese under her care and then to send it to you by the Stirling car

"I shall conclude this long letter with as you that I shall be very happy to hear fron or any of our friends in your country, wh portunity serves.

"My father sends you, probably for the last in this world, his warmest wishes for your w and happiness; and my mother and the rest family desire to enclose their kind compli you, Mrs. Burness, and the rest of your f with those of, dear sir, your affectionate co

Wheat for Silage

e have a nice piece of wheat that we want
it in our silo but have never used wheat for
age before. At what stage should the grain
hen cut? How short should it be cut with
nsilage cutter? Is it any harder to keep than
Should we run water along with it? How
protein will this carry as compared to corn
age?

ile spontaneous combustion of hay is doubt-
he cause of a considerable number of farm
yet a number of fires are attributed to this
they may be caused in some other manner.
nly may the fire be due to careless smokers
imilar causes, but not infrequently lightning
be the direct cause of the fire if the building
t properly protected by lightning rods. No
r under what condition hay may be cured,
is likely to be more or less fermentation in
ow, which will give off some gases. If these
are enclosed in a barn, there is a tendency
hem to accumulate in such a manner that if
arn is struck by lightning, the gas is readily
d and the fire spreads very rapidly, almost in
ature of an explosion. For this reason our
suggestion would be to have the barn proper-
otected by lightning rods.

ere is no definite and scientific method of
g hay so as to provide complete insurance
st spontaneous combustion. While it is of
rge comfort to the person who suffers from
a fire, it is, however, comforting to know that
loes not frequently occur when consideration
en to the number of barns in which hay is
d. Much of the danger can be avoided if the
s thoroughly cured in the swath, but this pro-
a hay of low quality and is undesirable as
ter feed for cattle. The next best practical
od is to follow the system of haying in which
ay is properly cured in the windrow or in the
where it has been given an opportunity to
ut to a reasonable degree and possibly pass
gh an original fermentation. Such hay will
eat up badly when put into the mow, par-
rly if it has not been wet by rain and is not
when it is put away.

spite the danger of spontaneous combustion,
are a number of farmers who make it a
ice to put their hay in the barn in a fairly
condition, being careful however to avoid,
far as possible, moisture on the hay as a re-
sult of rain or dew. Such hay will heat up in the mow and may even turn black and become almost charred. It is believed, however, that if the hay is well distributed over the mow and is thoroughly compacted so as to exclude the air, there is small danger that this heated mass will burst into a flame. This is based on the theory that if the air does not have access to the heated material, a flame cannot result. To produce combustion, it is necessary to have oxygen. Many who follow this practice of curing hay, prefer to spread the hay from one cutting throughout the entire length of the barn rather than filling up one mow at a time. They believe they avoid some of the dangers of superheating through this method.

The use of salt and lime on hay has been advocated on the assumption that they tend to prevent fermentation and check the growth of molds, while salt will also render the hay somewhat more palatable. These materials are not essential but are helpful especially when storing partly cured hay during bad weather. According to such information as is available, the use of salt would decrease the dangers of spontaneous combustion, but this is a subject that has not been very thoroughly investigated. Indeed, the whole subject of spontaneous combustion, its causes and its avoidances, seems to be largely a matter of opinion rather than the result of knowledge based on thorough investigation and experimentation. It would be highly desirable if we had available more accurate information on this subject.

It is extremely doubtful whether foggy, moist weather after the hay is in the barn would be a predisposing cause for spontaneous combustion. If this condition of the atmosphere prevailed while the hay was being put into the barn, it would be rather reasonable to suppose that it might cause greater fermentation, with the possibility of spontaneous combustion.

While we have seen no definite statement concerning it, it would be our opinion that the provision for ventilation at the roof of the barn might be helpful in controlling the danger of spontaneous combustion. It would also be desirable to avoid moving the hay or otherwise admitting air to it in such a manner that the heated material might break into flame.

As a matter of comfort to the one who fears spontaneous combustion, we offer the consolation that in the many years in which we have handled clover and alfalfa hay, there is scarcely a season but what the mow heats up and we notice large volumes of steam or moist air escaping from the top of the mow. The hay will be very hot and frequently when this hay is removed for winter feed, we find it a very dark brown color. In all these years, we have never had a case of spontaneous combustion, and we have noted the same condition existed on a great many other farms. While this is no assurance that we may not suffer from this, yet our own experience leads us to believe that the dangers of spontaneous combustion are somewhat overexaggerated and that probably many fires ascribed to this cause are actually due to some other cause.

The Light or Dark of the Moon

Does it make any difference whether potatoes are planted in the light or the dark of the moon? Some of the older people believe it does. Have the signs of the zodiac any effect on the castrating of colts or steers?

Mt. Vernon, Wash. F. K.

The particular phase of the moon in which potatoes or any other crop is planted has no effect upon its subsequent growth. The reason for the superstition as to planting in the light or dark of the moon doubtless is due to the fact that changes in the weather follow one another at rather short and seemingly irregular intervals while the changes of the moon's phases occur at short but regular intervals. These changes may frequently occur at the same time and humanity is apt to notice these and forget the failures of the two to coincide and which are just as numerous if not more so. The point to consider in planting potatoes is the question of proper growth and the avoidance of insect pests according to the section in which they are growing.

The same statement may be made as to the effect of the signs of zodiac on the castration of animals. There is no association between these other than castrating should be done when the weather is neither very hot nor very cold. It should also be avoided when flies are bad or when conditions that would bring about infection are likely to occur. Possibly the best season of the year occurs in the spring when the weather is cool and pastures are good. Consideration should also be given to the condition of the animals and the operation should be avoided when they are not in good health.

Are Silage Measuring Tables Correct?

Due to the short corn crop last year, we were forced to buy considerable silage. We used the usual silo tables for estimating the value of the contents of these silos, but were quite disappointed in some of the results obtained. We found on the whole that the actual weight of silage was about thirty-five per cent under the table. As an instance of this, last week we purchased 33 feet of silage in a 12-foot silo that weighed out 36½ tons over our scales.

I give below a list of the silos purchased on which I have records of size of silo and actual weights as they went over our scales in January and February of this year:

Silo	Year filled	Height of silo	Height of silage	Diameter	Tons
		Feet	Feet	Feet	
A	1925	40	21	12	52
B	1925	40	25	14	71
C	1926	38	17	14	40½
D	1926	36	21	12	30
E	1926	40	21½	14	44½
F	1926	38	20½	14½	45
G	1925	40	24	12	44
H	1925	40	25	14	77
I	1926	36	11	12	13
J	1926	36	33	12	36

As a result of this experience we believe all silo tables should be investigated carefully. There appears to be a great deal of misinformation going out on this subject.

Wisconsin. HOWARD T. GREENE.

The facts here disclosed would indicate the desirability of further investigation as to the capacities of silos. By use of the usual estimates, we have made the following comparisons with the figures as reported by Mr. Greene:

Comparing Actual and Estimated Contents of Greene Silos

Silo no.	Actual wt. Total	Actual wt. Per cu. ft.	Estimated wt.* Total	Estimated wt.* Per cu. ft.	Estimate over or under actual weight Total	Per cu. ft.	Per cent
